15922. By batteries do you mean the guns?—I mean the unit. A unit should be kept out altogether, and in the same way with a battalion. The second battalions might be kept out in India, Hong Kong, or Singapore permanently.

15923. But you would take all the men back at certain intervals?—The men would go out by drafts, and when they finished their service they would come home, and the officers in the same way. They would oscillate between the two battalions, and the result would be then that the regiment at the station where they are would keep up its traditions with regard to the station. It is

most detrimental to have a new regiment coming to a small place like Hong Kong: if it were to be suddenly attacked the officers would not know their positions at all. It takes them some time to acquire the knowledge, and if they happened to be attacked immediately after a change it would be a serious matter; for instance, some years ago the whole of the artillery at Gibraltar were changed at the Rock within a few months.

15924. (*Sir George Taubman-Goldie.*) Under your system there would be a gradual change of officers and men instead of a sudden gap?—Yes, there is such a sudden gap at present. We know how the system I propose works, because it is done at present in the Engineers.

15925. (*Sir Frederick Darley.*) But it would entail certain regiments, say, the Gloucestershire, the Worcestershire, or the Lancashire Regiment, never being at home?—One battalion would never be at home, but the officers and men would have their share of home service.

(*Sir Frederick Darley.*) But one battalion of the regiment would be a foreign regiment.

15926. (*Sir Henry Norman.*) Would not officers show a great disinclination to enter regiments stationed at places like Bermuda, for instance, which would give them a very limited opportunity for active service?—But the other battalion would have a chance of going on service.

15927. (*Sir Frederick Darley.*) But that particular regiment would never see service?—

15928. (*Sir Henry Norman.*) An officer at Hong Kong, judging by the past, would have very little opportunity of service?—The other battalion would have the opportunities.

15929. (*Sir Frederick Darley.*) But the other battalion would be a distinct regiment?—Yes, but the officers are always changing.

(*Sir Frederick Darley.*) I see your point, but it seems to me that there is a great deal in the name of a regiment—some old fighting regiment, for instance.

15930. (*Sir John Edge.*) How many years' foreign service would you allow in the case of the officers?—It is a matter of convenience of service.

15931. But you would not change them as often as you would change the men?—Yes, I think every six or eight years; there are many stations where it is not desirable that an officer should be more than six years.

15932. (*Chairman.*) You think that at the beginning of the war there was chaos and confusion?—Yes.

15933. And that was due to what you said at the beginning, the defective organisation of the Army?—Yes.

15934. But in one respect you were satisfied, and that was with regard to discipline?—The discipline was very good, I think.

15935. And a distinct improvement?—A marvellous improvement since 1878.

15936. (*Sir Henry Norman.*) To what do you attribute that great improvement?—I think one thing is the company training. The company training has had a most extraordinary effect on our Army, and another is the physical or gymnastic training in contra-distinction to the old barrack square training. The gymnastic training of the new kind makes a man a different person altogether. A soldier might be on the barrack square, and he would never become really smart, but put him in the gymnasium, and he becomes quite a different man, so smart and alert.

15937. In sub-section C of your statement you make some suggestions with regard to the training of officers: "Every officer ought to know what it is to march in the ranks" (that, I suppose, they do), "to do sentry duty on guard at night"; are they ever given that duty?—I do not think so. I do not think officers as a rule have to learn the duties of the men. I do not think the officers have sufficiently learnt the duties of the men so as to know what the men can endure. A great many officers do it. I have seen a great many officers on service carrying the rifles of the men and their valises, and I have also seen that on manoeuvres, but at the same time the officers have not been through the course, and they do not know what the men can endure. If every officer went through the same course as the men and knew what it was to be a sentry in a lonely place at night, he would have a much better idea what the men can endure.

15938. And live on the soldier's rations?—No, he cannot live on the soldier's rations.

15939. I thought you suggested that?—I think he ought to be put on it to know.

15940. You say in sub-section I. of your statement: "The second in command of a battalion should be assured of his promotion if he does well. At present every second in command 'lies low,' and in four years becomes nearly unfit for promotion." Has the second in command not certain specified duties?—No, he has not any real responsibility.

15941. The second in command is selected?—Yes; generally he looks after the canteen and matters of that kind.

15942. He does not gain much experience in any military duties?—No. I remember in former days it was said that the duty of the Major was to look after the effects of deceased officers.

15943. (*Sir John Edge.*) I want to understand about this question of confidential reports: are the Regulations with regard to the reports of a General Officer on his subordinates the same as the Regulations in force with regard to the Colonel commanding a battalion reporting on his officers?—Exactly the same; any officer who is animadverted upon is brought up before the General by the commanding officer, and whatever is against him is read out to him, and it has to be put on the confidential report that this has been done, and if it is not put on the confidential report it is returned to the General Officer.

15944. And that is printed on the face of the report?—Yes.

15945. You do not suggest that that Regulation is not complied with so far as the regimental report is concerned?—No, I am talking about reports made upon officers in the field which have not been communicated to them in any way, and they were quite unaware of their being found fault with until months afterwards.

15946. Do the cases you refer to arise on what is called the confidential report, or do they arise on a separate report made on a particular officer?—They may arise on a separate report, but the King's Regulations refer to all confidential reports—all reports.

15947. In connection with what are known as confidential reports—the ordinary confidential reports—you believe the King's Regulations are followed?—In peace time, yes.

15948. And you suggest not in war?—Not in war.

15949. (*Lord Stratheona and Mount Royal.*) Seeing that troops can now be transported with all comfort from England to the Pacific by way of Canada in some 10 or 12 days, do you not think that it would be a desirable route to India as an alternative?—Do you mean for them to march through Canada, or to be taken by train?

15950. By train?—Simply one route against the other?

15951. Yes?—I should prefer to send them by Canada, because they would then miss the chance of malaria when crossing through the Suez Canal, then down the Red Sea and through the hot seas beyond this to India, whereas I do not know by the other route of any place where they could suffer. They certainly might suffer if they stopped at Hong Kong, and it would not be desirable that they should stop there, or Singapore, but otherwise I think the Canadian route is a very good route for soldiers, and I think it would be very desirable that it should be used, because by that means we should be able to keep up the good feeling between the Canadians and ourselves which we have lost ever since our troops were moved from Canada. I think that keeping our troops in Canada in former days did a great deal towards keeping alive good feeling between this country and Canada.

15952. You are aware that reliefs have frequently been sent out to the North Pacific—that is, to Vancouver?—Yes.

15953. By way of Canada?—Yes, I have been through that route, and I have been over the United States and Canada, and know about it.

15954. And you would consider it a good alternative route?—Yes, I think for a soldier it would be very desirable.

15955. You recommend their going by South Africa, but the Canada route, you think, as an alternative

Lieut.-General Sir Charles Warren, G.C.M.G., K.C.B.

Lieut.-
General Sir
Charles
Warren,
G.C.M.G.,
K.C.B.

19 Feb. 1903.

route, is desirable?—I lay so much stress on the men marching. I think if you marched them through Canada at the proper time of the year it would be excellent.

15956. It would be rather a long march?—Only a certain distance—600 or 800 miles.

15957. 3,000 miles through Canada would be rather a long march, but they could do it by train and with all comfort now from Halifax, let us say, in five days; in short, in 12 days from England they could be at Vancouver.

(Sir Henry Norman.) There is a very small garrison at Vancouver, and you would surely not advocate that soldiers going to India should go by the Pacific route?

15958. (Sir John Edge.) How many more thousand miles would you have to carry them?—I think it would take four or five days more.

15959. Is your suggestion with regard to men you would send to the Cape to march limited to immature men?—No; it is not to be limited to them, but we have such a vast number of these immature men.

15960. You would send all men whether they were fit to go to India or not?—Yes, I think it a very im-

portant matter that the soldiers should learn their duties on the march. They never can learn their duties on the barrack square, but they can do it on the march, and if you give them something to do they learn their duties in a quarter of the time.

15961. Speaking about malaria, there is no malaria in the Red Sea, I suppose?—Yes, I should think there is; if you pass by Suakin there might be malaria, and mosquitos might come on board, but I do not know.

15962. But you are a long way off Suakin; have you ever known the case of a man getting malaria merely from going down the Red Sea?—You would not know, because you pass through the Suez Canal, and you certainly could get it there, as there are plenty of mosquitos.

15963. (Lord Strathcona and Mount Royal.) In another couple of years they will be able to transport thousands of troops from London to Vancouver within nine days in case of emergency; that would greatly shorten the time to India?—Yes.

15964. (Chairman.) Have you anything you wish to add to this précis you have given us?—I do not think so.

(After a short adjournment.)

Major-General Sir H. J. T. HILDYARD, K.C.B., called and examined.

Major-
General
Sir H. J. T.
Hildyard,
K.C.B.

15965. (Chairman.) You went to South Africa in October, 1899, I think?—That is so.

15966. And you were in command of the 2nd Infantry Brigade to the 19th April?—Yes.

15967. And of the 5th Infantry Division after that date?—Yes, that is so.

15968. Until when?—Until September, 1901.

15969. And your first service was in Natal?—In Natal.

15970. And after that?—I remained in Natal with a command partly in the Transvaal and partly in the Orange River Colony.

15971. Under General Buller?—After General Buller went home I remained in command.

15972. You have been good enough to prepare a statement based on the memorandum (*Vide Appendix, page 575, post*) which we sent to you. Will you now proceed to read it?—Yes. The second brigade was composed of four battalions that had been under my command at where, Aldershot they had been through a course of company training, battalion training, and brigade training earlier in the year. This preparatory practical work on the ground, conducted as far as practicable in service conditions, proved subsequently in the field of the greatest possible value. The commanding officers of battalions were thoroughly known to me and to one another; they understood one another's characteristics and those of their company commanders. In the whole system of training the greatest importance had been attributed to the responsibility and initiative of the company commanders. The regiments comprising the 2nd Brigade were the 2nd Battalion Queen's West Surrey Regiment, 2nd Battalion Devonshire Regiment, 2nd Battalion West Yorkshire Regiment, 2nd Battalion East Surrey Regiment. They were completed to war strength by the incorporation of Reserve men without any difficulty or friction, with the exception of the 2nd West Yorkshire Regiment, the Reserve men of which were insufficient. A Brigade Bearer Company and Field Hospital were allotted, and the entire Brigade, including these units and the Brigade Staff, embarked on the 20th October on board three ships at Southampton, and sailed simultaneously. At this time it formed the 2nd Brigade of the 1st Division, the destination of which was Cape Town. The divisional commander was to sail the following day, and anticipated arriving before the 2nd Brigade, and making the necessary arrangements for disembarkation and movement. The three ships did not keep company, and the "Roslin Castle," having on board the Brigade Staff, 2nd West Yorkshire Regiment, Bearer Company, and Field Hospital, arrived first, on the evening of the 8th November, at Cape Town. On the 9th, after taking the orders of the General Commanding, the vessel went on to Durban, where the troops were disembarked and sent up to Pietermaritzburg on the 12th November.

Strength.—The strength of the Brigade on embarkation was:—

117 officers,	4,214 other ranks	- 20th Oct., 1899.
112 "	3,705 "	- 28th Dec., 1899.
115 "	4,144 "	- 30th Jan., 1900.
109 "	3,814 "	- 24th March, 1900.

The strength, therefore, was fairly well maintained during the most arduous portion of the operations.

Shooting Capability.—Our men held their own very well in the matter of deliberate shooting. On various occasions when occupying ground opposite to Boer trenches I have found that the soldier held the Boer, and that the latter had a distinct respect for his fire. At long ranges the volley was found useful. I noticed that so long as deliberate fire was possible the soldier was very steady and keen to correct his aim and shoot up to the objective. But directly anything exciting or unexpected happens, the soldier's aim becomes very undependable. It is to remedy this that snap-shooting has been encouraged recently, and it can scarcely be overdone.

Marching.—The marching was satisfactory, owing to the use of ox-wagon transport. The rate and direction of the infantry marches were not generally excessive. But the heat and drought were most trying, and it required both stamina and pluck very often to keep men going. If men were to be brought along in a fit condition to fight, the rifle and 150 rounds of ammunition was found to be quite a sufficient load, and great coats had to be carried for them.

Horsemanship and Horsemastership.—My experience lay chiefly with the irregular regiments first formed on the Natal side—Bethune's and Thorneycroft's Mounted Infantry and Byng's South African Light Horse. They were raised before the country-bred horse was exhausted, and they were all thoroughly well commanded and organised. Their methods were often rough and not neat, but they were a handy lot, and looked after their horses. They were thoroughly good value. There were a number of cavalry regiments that came under my notice from time to time. The horses brought out with them from England soon ran down, and I take it comparatively few of them regained condition. Directly oats got short, even temporarily, it affected the big horses. There was often great difficulty, too, in regard to regular watering. It is possible, had the English horse had a quiet time after being landed, in which to become acclimatised, he might have done well; in any case, that he did not do so was not, I think primarily, or perhaps, even chiefly due to an absence of good horsemastership. There was a company of Mounted Infantry mounted on country-bred horses at the beginning of the war that a year later, after continuous hard work before the enemy, had 36 of them still fit.

Entrenchment and Cover.—It repeatedly happened that the Boers occupied a position, having in advance of it a crest line forming a false position, and commanded by gun and rifle fire. It was consequently desirable to minimise losses by rapidly throwing up

cover. But this was difficult to do, for the entrenching tool carried by a proportion of the men was ill-adapted for the hard, stony ground, and frequently it was not practicable to get the tool-cart with picks and shovels up. At first men were inclined to economise their labour and scamp the work they had to do, and officers were too easily satisfied. But after they had been once properly shelled they realised what it meant, and there was no further incentive required to work. Where in this war the necessity for artificial or improved cover from fire was especially noticeable was as a protection against concentric fire arising from the long-range arms, the wide fronts, and against attacks made at night and by surprise. All-round entrenchment even was no sufficient safeguard in all cases from losses, for the enemy's all-round fire against these defences reached the reverse of the defenders, and had a very demoralising effect. To be in effect secure, paradocs were required in certain situations when defences were to be occupied for any length of time.

Physique and Morale.—The physique of the men who disembarked with their regiments was excellent, and left nothing to be desired. Generally the Militia Reserve men and the Volunteer Service companies were satisfactory, though some men were sent out who were quite unfit for arduous service such as they had to perform; the drafts of young soldiers who came later were soft and unformed, and a great many went into the hospitals. The men belonging to Section D of the Army Reserve who were sent out were not thought to have been so well up to the work as others—not for some time, at any rate. It was noticed a considerable number of Army Reserve men of one of the brigades that contained a large proportion of miners were deaf in varying degrees, often sufficiently so to constitute a serious disability for night sentry duties. The morale of the non-commissioned officers and men was very satisfactory; they kept up their spirits in a remarkable way in most discouraging conditions often. Their degree of intelligence was that of their class; it is not to be expected that men who join, as a proportion do, absolutely illiterate, will develop into very intelligent soldiers. But there is generally a fair proportion, and in some regiments a large number, who are sharp and intelligent, and can be counted on as leaders. Careful, intelligent, and untiring individual training on the part of the officers is the best preparation of the soldier for his duties in war. But to admit of this being effectively done it is essential that officers shall not be taken away from their legitimate duties, and that soldiers should not be employed on work that withdraws them from their companies. The individual training and teaching in every detail concerning the use of ground and of the rifle must be followed by the equally careful training of the squad and section. The subordinate commanders must be taught how to lead their commands, and in what conditions they will have to act on their own responsibility; their sense of initiative must be fostered in every possible way. It must be impressed on them until it becomes a second nature that every commander, however subordinate, is responsible for his own flanks. Explanation and demonstration on ground should be the earliest and most continuous lesson to the soldier, whatever his rank. The difficulties in the way of having a thoroughly efficient and well-trained body of non-commissioned officers are enormous. There are no training schools for them, as there are in Continental armies, and except during the period of annual training, and by no means always then, they have no facilities for practising on ground with men the subordinate commands they have to exercise in war. That they did so well in the South African War in spite of the disadvantages in the way of efficient training and inherent in the voluntary system of Army service, is altogether to their credit.

Deductions, Training, and Duties of Officers.—**Regimental Officers.**—They were excellent whether in looking after the welfare of their men in every situation of service or in leading them in action. They were ready to take responsibility and to act on their own initiative when the occasion required. The example they set to their men was past all praise. If any distinction is to be drawn, it would be in favour of the officers of those units that had been through field training at stations where ground was available for carrying out this training in its entirety as directed by the regulations in force previous to the war. It was, however, only exceptionally at stations at home that this could be done, on account of the want of ground for training purposes. For the efficient training of regimental officers for war it is essential facilities should be given for working over

ground in service conditions. This means that sufficiently large areas should be made available for the practice of exercises illustrative of war; and Army Corps commanders should be given powers to utilise such ground in the areas of their commands as may be required for the purpose. Another necessary requirement for the efficient training of regimental officers is that during the whole of the training season squadrons, batteries, and companies should be kept complete, with their full complement of both officers and men. If this be done, the responsibility of their commanders can be made a reality, and they can be tested as regards their efficiency by the results they attain in the training of their officers and men.

Staff Officers.—In those commands the general staff officers of which had gone through a practical course of instruction in all branches of staff duties as practised in the field, the results were satisfactory. At the Staff College the course of instruction had for some years been arranged to meet the requirements of modern war, and its most distinctive feature was the large proportion of the teaching and practice done on varied ground and under various suppositions. Some of the officers who did most valuable work in South Africa, not only as general staff officers but as column commanders, received their instruction in knowledge of ground and operations in war at the Staff College. The teaching followed the system laid down for the administration of the staff of the Army. The underlying principle—first aimed at in 1871 by the amalgamation of the two titles in the lower grades of Deputy Assistant Adjutant-General and Deputy Assistant Quartermaster-General—was the unification of the staff and the allotment of the several sections of duties by General Officers Commanding to the officers of their staffs best fitted in their opinion to perform them. The arrangement by which, in 1889, the administrative duties of supply and transport were brought within the scope of general staff duties, and allotted with other existing staff duties, as a separate branch, was tested practically for the first time in the South African War. It never had a fair chance, for the Army Service Corps officers appointed to administer these duties had, with very rare exceptions, not been trained in general staff duties in war. It consequently became necessary in some cases to re-allot the duties to a certain extent, but this was within the province of the General Officer concerned, and, within my own experience, no difficulty resulted. The orders, both daily and for operations, the arrangements for distribution, movement, security, and halting were executed with promptitude and precision, and I was well satisfied with the results. The administrative duties of supply, convoys, and transport were the business of the Army Service Corps officer on the general staff, and their administration gave him plenty to do.

Supplies of Ammunition, Equipment, Food, and Forage.—The force in Natal was supplied with regimental transport, and thoroughly equipped with ammunition columns and parks, and was seldom far removed from the railway, which was brought on as the force advanced. (a) **Method and Sufficiency.**—It is probably seldom that a force in the field has been so well supplied with most things required to maintain its efficiency. With the exception of clothing, which was at the time of the relief of Ladysmith in a very bad condition, the men not only had all they required, but the rations were supplemented by a field force canteen, that sent up miscellaneous goods, tobacco, milk, etc. It was probably due to this that the men maintained their health and spirits during a very trying period. The chief defects in equipment were the great coats, which could not be carried by the men, both on account of their conspicuous colour and of their weight; the ammunition pouches, which led to a lamentable waste of ammunition; and the portable entrenching tool, which was not sufficiently strong for the rough, rocky ground in which it was required. (b) **Quality.**—The food was generally very good. Certain brands of tinned meat were bad, and had to be condemned. The want was felt of a really portable field ration, of which two or three complete in themselves could be carried by mounted men and infantry without over-weighting the horses or men. (c) **Delay or failure on the part of contractors.**—No observations. The same remark is applicable to forage. (d) **Number and Quality of Horses.**—There was always practically a shortness of horses, and those arriving from over-sea had to be sent up country frequently before they had time to recover from the voyage. But even when kept for a time at depôts there were no sufficient means of conditioning them, and though they looked perhaps well, they rapidly succumbed to hard work from not having been acclima-

tised. The country-bred was far and away the hardest stamp of horse.

Land Transport on Railways.—The Natal railway was invaluable in the earlier period of the war in supplying the Natal Field Force, and later on in supplying the forces based on Johannesburg and Pretoria. It was worked throughout within the limits of Natal by the Natal Government Railway Service, by which the larger works of restoring the railway and bridges destroyed by the enemy were most satisfactorily performed. Railway Staff Officers were appointed at the principal stations for military purposes, but they did not interfere with the working of the railway service, which continued in the hands of the station-masters. The works at the immediate front, the diversions necessary for temporary bridges, the restoration of culverts and many other services were executed by the Royal Engineers, or under their direction, very efficiently.

Ox and Mule Transport.—The whole of the transport, regimental and general, was ox and mule with the Natal Field Force. The fact of having ox transport hampered the force enormously in the matter of mobility; on the other hand, it secured absolutely the supply of the force. The arrangements in regard to both ox and mule transport were excellent; civilian conductors were in charge of the sections allotted to different services, and were invaluable in controlling the Kafir drivers and looking after the grazing and welfare of the animals. The Kafir drivers did good service, and were as a body most satisfactory. Had it been found practicable to work entirely with mule transport, the mobility would have been largely increased, though it is doubtful whether it could have got along as the ox transport did when the country was deep and the roads or tracks were cut up.

Traction Trains.—No knowledge.

Medical and Engineer Services.—The Medical Services were excellent, and except when pressure was great from the number of enteric and dysentery patients in the field hospitals, they were adequate. Such exceptional periods can hardly be provided for, for the sickness that overcrowds the hospitals also claims its proportion of officers and men of the Medical Service. The pressure in these instances was met in some degree by civilians from the Bearer Service organised in Natal. The Engineer Service was adequate and highly efficient.

Effectiveness of Guns, Rifles, and other Armament used.—The effectiveness of the field guns when a target could be obtained within their effective range was all that could be desired. The difficulty was that such a target was most rare, for the positions occupied by the enemy generally gave command of view and fire from much longer ranges, and their longer-ranging guns were effective before our field guns could touch them, even had their position been detected, as was seldom the case. It was quite sound, therefore, to move the field guns within their effective range before opening fire. When this was done the enemy were unable to fire from their position so long as it was kept under fire, but the losses inflicted were small, for the enemy were secure in their deep trenches from shrapnel fire.

The effectiveness of the fire from the howitzers was greater, though this effect depended on the shells actually falling into the enemy's trenches, which seldom happened. The naval 12-pounders and 4.7 guns, while ranging to considerable distances, were not as effective as they might have been expected to be on account of the impossibility of accurate ranging and observation of target, and also of the unevenness in the propelling power of the charges. The Lyddite shell seems to have caused much nervousness, particularly at first, but I could not ascertain that it caused much actual damage. The Lee-Metford rifle was an excellent arm, taken altogether, though the Mauser had an advantage in the clip-loading and the sighting. The machine guns did very good service on many occasions, especially in defence and in outpost positions. The mounting on a heavy wheeled carriage with horse draught was cumbersome, made concealment impossible when in movement, and made access to many positions in which they would have been useful impossible. The tripod mounting subsequently introduced was a great improvement.

General Remarks.—It is dangerous to base specific conclusions in regard to the use of the several arms upon a series of operations that were from the outset abnormal, both on account of the peculiar physical conditions of the country in which operations took place, as also by reason of the peculiarities of the organisation and mode of warfare adopted by the enemy. As regards cavalry as cavalry, in a war in which from the outset no regular cavalry was opposed

to it, the lessons can be only incomplete. The experiences gained point to the necessity for lightening the weight carried by the horse, to providing the cavalryman with the most effective rifle obtainable, and to training both officers and men to the efficient use of it in service conditions. There is probably a great rôle open in certain conditions for the strategic use in future wars of large bodies of mounted men with guns. There is really nothing new in this, for the increased power of the rifle was well known before, and its value claimed as adding to the independent power of bodies of cavalry. The war brought out, no doubt, strongly the great value in certain conditions of mounted troops other than regular cavalry, and every effort should be made to organise and train such troops, whether at home or in other parts of the Empire. Such troops, whether operating in concert with the cavalry in carrying out independent movements, or with the infantry in guarding the flanks or executing wide flanking movements, will be of increased value in future wars.

Artillery.—The employment of the artillery must depend in some degree on the nature of the war, but the general use of each class of gun has been in some degree defined by our experiences in South Africa. The effective range of the field gun for shrapnel has already been augmented, and will have to be still further increased; equipment and weight on the horses reduced; observation and locating of hostile guns constantly practised in new ground. The value of field howitzers for searching out occupied and prepared positions has been recognised. The employment of heavy long-ranging guns has been lately approved, and they now find a place with corps artillery. Perhaps the greatest difficulty before the artillery is to locate carefully-hidden objectives, whether these be hostile guns or riflemen hidden in carefully prepared trenches. Once these targets are recognised fire will usually be concentrated on them; whether for this purpose the guns be dispersed and the fire concentric, or the guns concentrated, must depend upon ground and space and time. There can be no absolute rule for guidance.

In regard to infantry, some considerations are the use of broad fronts, the gaining of successive fire positions towards the main objective, the further advance covered by fire from such positions, and the pushing in of the attack at all costs, at the point or points it has been determined to capture. More than was ever the case before officers and men require to be thoroughly trained in the use of the rifle and in the employment of ground. This can only be effectively done by the instruction and practice taking place in every variety of ground, and for this the commanders responsible for the training must have access much more freely than in the past to private property.

15973. I understand that you had one advantage in the brigade under your command from the fact that it had been under your command at Aldershot?—Yes, I look upon it as the very greatest possible advantage. I believe it to have been the only brigade that went from the United Kingdom as a brigade, and that had been trained as a brigade under its own commander before its embarkation, and, from that having been the case, during the whole time they were with me in South Africa I looked upon it that I derived the greatest possible advantage from the fact of knowing the commanding officers, knowing the company officers, and practically knowing each regiment in detail, and knowing exactly what I could expect of them. On the other hand, they knew my ways, and we did practically in war what we had done in peace time when we were training under service conditions at Aldershot.

15974. Did you keep the brigade together the whole time?—Almost the whole time; practically the whole time. One regiment was taken away.

15975. And that you consider is the proper way in which an army ought to be organised?—I think it is the only way for efficiency.

15976. Were you able at Aldershot to give them training which was practically useful in war?—Yes, most useful. With that brigade we had gone through, two years in succession, a period of company training under the company officers superintended by their commanding officers and by myself; a period equally of battalion training with each battalion with all its men in the ranks going through the period of training under its colonel and under my supervision; and after that again we went through a period of brigade training under canvas. We went to Woolmer and other places not actually on the spot, and there we practised

every possible operation that we were likely to perform in war.

15977. Is the area sufficient at Aldershot to give the training that is necessary?—Not for a large body of troops; of course, it is better to get them away elsewhere if you can. And if I might say so, that was one of our great difficulties in the training of our troops and in the training of our staff, and in the training of our officers: that we had never had really practical manoeuvres in England, and very seldom we had manoeuvres at all. We tried very hard at Aldershot, when Sir Evelyn Wood was commanding one year, I remember, to arrange manoeuvres by mutual agreement; the landlords were willing and the occupiers; that is to say, the farmers were most anxious to see us, but there were people called shooting tenants and shooting syndicates, which absolutely stood in our way, and we were unable to get the ground; and unless the country will give us the power to work over ground under service conditions, with compensation, of course, for all damages, but to go everywhere except into private houses and private parks and places of that kind—unless that full power is given to us I do not see how we shall ever get the Army trained for war.

15978. In England?—In England.

15979. Because of the enclosed nature of the country?—Yes, and on account of the partridges, too, because it applies equally to the open country.

15980. Even Salisbury Plain is not big enough?—Salisbury Plain is big enough, but we could not get Salisbury Plain except under the Act, and having used it under the Act five years ago, we cannot use it again this year because under our Manoeuvres Act we are not allowed to use the same area unless five years have elapsed since we used it last.

15981. And the sort of training for which you require these extended areas is, in your opinion, essential to get an army such as is required under modern conditions of warfare?—It is absolutely essential.

15982. You have entered into the various points mentioned in our memorandum. As to shooting, do you think that our men held their own with the Boers?—I found on many occasions, when one was able to know, that they held their own; of course, it was a very difficult thing to prove. Where really they held their own, and where one knew that they held their own, was when one got the Boers lying opposite to our men, and each was protecting himself in the best possible way. Then you had access afterwards to the Boer defences, and you saw really what the effect had been, and the Boers told you. There was one commando the 2nd Brigade laid opposite to for several days and nights, and for a portion of the time we were at the nearest point within about 250 yards of them. We compared notes afterwards, and they had felt our fire enormously; they had been absolutely unable to leave their trenches for any purpose whatever.

15983. I see you advocate volley firing under certain conditions?—They disliked it; they said really that the volley firing and machine gun firing was what they could not put up with, because it seemed to search them out; it came everywhere at once. But that is only at long ranges.

15984. As a rule, I suppose, it is individual firing that has to be trained for?—Certainly.

15985. And is it not individual firing in which our men, under present conditions, are less effectually trained?—Of course, they are less effectually trained, because you take a man really who has never seen a gun, and you give him a gun which is quite a strange thing to him, and it takes him a long time to get accustomed to use it at all. It is not as if all our population were accustomed to handle guns before they joined the Army.

15986. I understand you to say that one of the difficulties in the marching, which was otherwise satisfactory, was the weight the men had to carry?—Yes, that is so; we had to lighten them very much. That was particularly so, of course, with the mounted troops; but, talking about the Second Brigade, as I am doing now, what we found was that they got along somehow, but it was very hard. The heat was intense, and they got along somehow if we did not overweight them, but directly they got overweighted they broke down, and they were not fitted to fight; if we had encountered the enemy we would not have been able to attack his men. That was climatic.

15987. The greatcoats were a difficulty?—The greatcoats were very heavy, and also, when rolled, the Boers made a target of the greatcoat, because when a man lay down the greatcoat showed, and the Boer laid his rifle on the greatcoat, and directly the man moved he shot; directly he saw the thing move he shot, and that is the way he got his man.

15988. What is your suggestion with regard to greatcoats?—I think they cannot be carried.

15989. That is rather hard upon the men at night, is it not?—Yes, you have to put up with it. Eventually the blanket and waterproof sheet were carried, but no greatcoat. When they could be carried with the men in wagons it was done, but, of course, it is a very ponderous way of doing it.

15990. Are a blanket and a waterproof sheet more easily carried than a greatcoat?—Yes, they are lighter, and particularly if you are having wet weather the waterproof sheet is indispensable really.

15991. And it does not become subject to the same disadvantage about giving a target?—No, it is khaki colour.

15992. (Sir Frederick Darley.) Could the man not unstrap his coat and put it under him, for instance?—Yes, he could do that, but then he would never get away with his coat if he was in a hurry; you cannot use your arm and carry an unfolded coat too.

15993. (Chairman.) You had not so much to do with the irregular regiments—mounted infantry?—No, I had Thorneycroft's and Bethune's. They were both raised with me and under me, and they were with me a long time afterwards, and also Byng's, the South African Horse; those I had under my command a great deal, and I saw a great deal of them, but not of the Colonial regiments.

15994. (Sir Frederick Darley.) Not the oversea Colonials?—No.

15995. (Chairman.) You found difficulties with the horses that came from England?—There were difficulties in acclimatising the horse; I think that was really the main difficulty.

15996. It took some time?—It took some time to do.

15997. And there was not time to do it in?—No.

15998. But there was some want of good horsemastership besides?—Of course, there was that, and there always will be that. The watering and the feeding of course, are the two great things, and both were necessarily very irregular indeed, but we had a dépôt at Durban, and we had a lot of Hungarian horses there, and when we had kept them for really a very short time indeed they got quite fat and sleek, in excellent condition. They went up to the front, and they were not hard; they had had their sea voyage, and had been in this hot stewpan, where they throve, but they were not hard, and they all broke down.

15999. Because they were not acclimatised?—Yes.

16000. Did you form any opinion about the Hungarian horse generally?—I think it was too light for the work there—certainly too light.

16001. Are you speaking of the cobs?—Of the cobs, yes. They were horses that were light boned, and I think they were too light for the rough work they had to do. Of course, if you look after a horse, and use really good horsemastership, put it into the stable and have a man to look after it, and do nothing else, a horse like that will do a great deal, but what I found myself (I had one or two of them) was that as long as they had ordinary work to do—I mean an ordinary day's work—they were all right, but directly you overtaxed them they broke down, from want of stamina, I think. Some years ago, when I was at the Austrian manoeuvres, I was told that the Hungarian Cavalry were not mounted on pure-bred Hungarian horses because they were so light, and I believe that was the fact at the time; whether it is so now I do not know.

16002. Regarding entrenchment and cover, you say that the tool that was carried was not well adapted to its purpose?—No, it was a small, light tool. Personally I was always glad to have some of the tools; they got very rare in the end, but the British soldier and the company officers would have none of them. The Boers never omitted to pick one up if it was about, and to my mind it was really better than nothing. We were in a great many places where the tool carts could not get up—they were upset—and then personally I was pleased

Major-General
Sir H. J. 1

Major-General
Sir H. J. T.
Hildyard,
K. C. B.

19 Feb. 1903.

that we had this tool; but it was not a good one, and, of course, it was an extra thing for the men to carry.

16003. What was it; a light pick?—A light spade; a small heart-shaped spade almost, no pick, so that it was not any good for really heavy work; and I admit it was universally condemned by the company officers and the men. My own opinion is that the only practical way is to carry a certain proportion of spades and picks on mules—to have mule transport for them.

16004. Really good implements?—Yes. It was a curious thing that in the Boer trenches we found any number of picks and shovels, and the pick was of very much better tempered metal than ours was, and our men always got hold of it when they could.

16005. Are you speaking of the picks that were served out as good tools to our men when you say that they were badly tempered metal?—Yes, the entrenching tools; they were not so good as those of the Boers; they did not grip so well.

16006. The men, I think you agree with other evidence which we have heard, found the necessity of cover as soon as they came under fire?—Yes, that is so, very quickly.

16007. Were they able to make proper cover for themselves under those circumstances?—No, they were very bad at first, and I think that was due to their not being able really to practice making proper cover in the field training at home, because you can go over ground, but you cannot dig trenches, and the consequence is that we get very little practice in it. I tried very hard when I was at Aldershot (I was commanding there for a time) to get some ground for the purpose of digging practical trenches in, but really it is so hard, because any ground that you dig on you cannot have your cavalry moving about on afterwards.

16008. (Sir George Taubman-Goldie.) What practice do you think the Boers had prior to the war in entrenching?—They had very little, but they had the Kaffirs to dig for them. During the war most of the trenches were dug by the Kaffirs.

16009. Did not we employ natives for that purpose?—Yes, we did.

16010. Later?—When we had the natives with us. But, of course, the Boer was stationary; he went to a place and meant to stay there; we moved up to a place during one operation, and we could not carry about any numbers of Kaffirs on purpose to dig, but eventually we organised them to a certain extent.

16011. But you would not say that the Boer was stationary when he went from Laing's Nek to Colenso?—Almost stationary. Every place they dug on they meant to stay on, and if they left it they meant to leave everything they had there, and they left all these picks and shovels, and any amount of ammunition; they took nothing with them. If they were off they were off, and they left the whole thing. But their system of trenches was most intricate.

16012. They brought the natives with them from the Transvaal?—From all round; they got them from all the kraals. But, of course, we wanted every native we could get for drivers.

16013. We had the same supply of natives to call upon as they had to fall back upon?—No, not quite, because where we were operating, as a rule, the natives, or most of them, quitted when the fighting began, others we removed bodily. Then, in Natal, really, we had to pay for them all; we had to act under the law there; there was no law under which we could make them work for nothing, like the Boer does. It is a different system.

16014. Had you not martial law in Natal at that time?—Yes, we had martial law, but we always thought it better to pay the Kaffir for what he did.

16015. That is really the point, that we paid the Kaffir and they impressed him?—Yes; but, of course, apart from that I can think of several occasions on which we had a heavy march and a stiff climb, and then directly we got to the top under fire, we wanted to make our trenches, and I do not think any system of Kaffir labour would have helped us there. It did afterwards when we wanted to make deliberate trenches, and then we organised them, and used them in gangs.

16016. That is just my point. Did not the Boers do the same thing; did they not have long climbs and then make trenches?—No, I do not think so.

16017. (Chairman.) You are satisfied with the discipline of the troops as a whole?—Yes, perfectly.

16018. Considering the amount of intelligence of their class?—Yes. Of course they vary very much. In certain regiments we have plenty of men, for instance, with sufficient intelligence to make good non-commissioned officers, but there are others where it is a most difficult thing to get sufficient good non-commissioned officers. We have not got the men to find them, and it depends on the sources from which the recruits for those particular regiments are drawn.

16019. Do you think that a smaller army with more intelligent men would be more effective than a larger army of the present recruits?—Of course, it depends; you have to define the size of your army. The difficulty of our Army is that we get it so young, that the waste is enormous, and the consequence is that we have to get a very large number of recruits, and you cannot, amongst that number, expect to get the best intelligence of the country. I think if in any moderate degree you reduced the numbers it would not practically have much effect, but whatever army we have, if we cannot have a large one, it ought to be as perfect as it is possible to make it in the matter of training.

16020. (Sir George Taubman-Goldie.) But if you reduced the number you could get better men?—Yes.

16021. You could pay more?—You would go a long way before it was really sensible. After a time, of course, you would feel it. Incidentally, if you had an army like Cromwell's, who paid his men 2s. 6d. a day in the currency of the day, if I remember right, that would get a very fine army, but that would mean a great deal more now.

16022. (Chairman.) Under the present system the only thing is to look to the intelligent training by the officers and non-commissioned officers?—I think so, with proper supervision, of course.

16023. The non-commissioned officer is a difficulty?—Yes, he is a difficulty. They are a very fine body, but in some regiments there is a difficulty in getting enough of them.

16024. Have you any suggestion to make with regard to meeting that difficulty?—No, I think it is local. I think that in some parts of the country the men are not perhaps very intelligent in the very class you want to get, the agricultural class, and I do not see how you are to remedy it.

16025. Then we come to the heading of which I suppose you would speak with great authority—about the training and duties of officers?—Yes. I have only given my own views with regard to that, and I only speak of my own experience, of course.

16026. As regards the regimental officer, you say he needs to be trained in taking responsibility?—Yes, and that, of course, is a very great difficulty—to give duties which will be of a responsible nature.

16027. Is not that difficulty increased very much when the regiments at home are depleted, either for other duties or for other causes?—Yes. Unless you have your regiment kept complete you cannot get responsible work for the officers.

16028. And that is the case now?—That is the case now. There are so many employed men that we have not got enough men to work practically on the ground, particularly after the heavy annual drafts to India and the Colonies.

16029. Then, as to staff, what have you to say?—So far as I had to do with the staff the staff did admirable work. Of course, the system of the staff which had been changed was on its trial, and the allotment of the staff and the officers who had been appointed to it led to some officers doing staff duties who had never been trained in them—I mean the Army Service Corps officers who were appointed to the staff—and that was a defect and a drawback no doubt.

16030. What was the change you mean that had been made?—The change made was that an Army Service Corps officer was appointed as one of the General's staff with a division, and his duties were altogether administrative. He had nothing to do with the Army Service Corps troops, but he looked after supply and transport and contracts in peace, and in war he looked after the camping and water, and those duties which have been rather Quartermaster-General's duties. He had had no training in that; he had not been to the Staff College, and he had no knowledge of it; and it was a weakness. But it is in the power of the General to

arrange his staff in what he thinks best for the Service, and I found no practical disadvantage, because I told off another officer who had been trained to do that portion of the duties, and the Army Service Corps officer was confined to his Army Service Corps duties.

16031. Is it intended that the Army Service Corps officer should go to the Staff College in future?—The system has been changed. Lord Roberts, since he has been Commander-in-Chief, has appointed Quartermaster-General officers, and the Army Service Corps officer is not on the General's staff now.

16032. It has been altered again?—Yes.

16033. And you consider it necessary for an officer to serve on the staff that he should have been through the Staff College?—Yes, I think absolutely. I mean that he will have a very much better knowledge of his work if he has been through it. There is a great deal taught there which is of great value to any officer, and if a good officer goes there he is better for having been. He knows more about staff duties, and what they do in foreign countries, and he has a great deal of practical working in staff duties.

16034. Do you think it is desirable that an officer who serves on the staff should revert to his regiment?—Yes, I think it is good.

16035. That he should not have continuous service on the staff?—No.

16036. That it is desirable both on his own account and also for the regiment?—Yes, I think so, and for the Service at large I think it is good value for him to go back. He comes from his regiment thinking of nothing but his regiment, and that being his principal interest he goes back to it thinking of the Service as a whole. I think that does a great deal of good.

16037. You think it should be the rule that an officer should go back?—Yes.

16038. It has been suggested that he should go back with promotion. Is that necessary?—I do not think you could do that. I think it would cause an enormous amount of jealousy on the part of his brother officers to do that. It is the custom in some foreign armies. I do not think it would do.

16039. It ought to be sufficient for him that he has had his turn on the staff, and then he should go back to his regimental duties?—Yes, because if he is of any value on the staff, when he has done his tour of regimental duties, he will be appointed to the staff again. He gets the advantage probably of going on service whenever there is any campaign of any size, and altogether he gets many advantages from it. I think that it is invaluable for the staff officer to go back and command his regiment, both for the regiment and for the staff as a body.

16040. Speaking generally, were you satisfied with the staff officers?—Yes, the staff officers whom I had with me, and whom I saw, were all men who went out with the first formations, and who had been selected for their capacity in staff duty. Of course, later on, when there were 300,000 men in the country, the staff officers, a great many of them, had not been really specially trained, and it took them time to pick up their duties at all, but with the formations that went out first I think the staff was good.

16041. But if we had to look forward to a war of the same dimensions, we must make some arrangements for having well trained staff officers?—Yes, I think you must. I think the accommodation should be increased at the Staff College, so as to accommodate more. That really is the difficulty now.

16042. (Sir George Taubman-Goldie.) Then, will the number of instructors have to be increased too?—Yes, but not to a great degree.

16043. Could the time be shortened at all?—That, of course, has been recommended very often as an alternative.

16044. Or both combined?—Yes, or combined. Personally, I have not been in favour of it, because I have seen so much good result from officers of different branches of the Service being together for the two years. If they are there a shorter time they will never settle down; then either they have just come or are just going away, and they do not get settled. With the two years they get settled; they get their horses and they settle down and get to know one another thoroughly; and at the end of the two years a man who had come in perhaps with a very fine opinion of himself quite recognises the fact

that a man in another regiment is a more capable man than himself. I think it is of great value.

16045. Subject to the money question, would you like to see the number doubled?—We have 80 there now. The proper number is 60, I think, but we have 80, and I hope we shall be able to keep 80 there. I think it ought certainly to be increased to 80 now, and that would give 40 a year; 40 men a year soon runs up the numbers.

16046. Would you be in favour of selecting men for the A work and the B work at an early stage, so as to put the men on the A work through a shorter course?—Of course, one has rather to enter into the whole constitution of the staff to answer that. In 1871 the idea was first formed, I think, of unifying the staff, having it all one staff. They have got it all one staff in Germany, the general staff, but really that is only the operations staff. The idea was to follow that, and that the General should have a certain number of staff officers all trained in the same way, and that then he should allot them. He says to one man: "You are to look after the water and the bivouacs, the outposts, and security, and the reconnaissance," and another man is to look after the orders of the operations department, and so on, and he allots them as he wishes, and he finds them all up to a certain point trained in all the different things. That is the idea, and that is what I think was aimed at in 1871. At that time we had an Adjutant-General's Branch and a Quartermaster-General's Branch, and it was rather found, I think, that in stations at home, in small stations, and fortresses, and such places, and equally at Aldershot, there was not room for the two. The one branch I mean was always grabbing all the duties, was more active than the other, and the other was left not doing a great deal and still they were in separate departments. So they were put into one. They were appointed after that in the lower grades with a double title, as Deputy Assistant-Adjutant and Quartermaster-General. That went on for many years, till 1888, and then this further development was made, which I have referred to already, when the Army Service Corps officer was brought in to perform the duties classed as B.

16047. But the B officer takes much longer to train, does he not, than the A; he has much more complicated duties to learn—knowledge of ground, selection of camps, etc.?—That is the point, you see; the A officer did that latterly.

16048. As well?—In the war my A officers did the whole of that; they had been trained in those duties.

16049. That is not usual, is it?—Under this system it is the only way you can work it.

16050. Do you approve of the system?—I approve of unifying the staff, or to put it on the system they have in Germany, which is that the general staff is the operations staff. But in Germany, besides the general staff officer, there are three other branches not forming part of the general staff, the intendant's branch, which deals with supply, the auditor's branch, which has to do with law, and the adjutant's branch, which deals with returns and Adjutant-General's duties. They are all the staff, but they do not belong to the general staff at all.

16051. But in India the theory is, is it not, to draw a broader distinction between A and B than we draw here?—That has always been done, but Sir Henry Norman would tell you, I am sure, that there the B, the Quartermaster-General, takes up all the more important things, and the A, the Adjutant-General, has the less important ones, in regard to operations and all those things, and it was so with us once.

16052. The question really that I was asking is whether it is not good to train men for the various branches separately, whether a man could not learn at the Staff College the A duties in a much less time than he would learn the B duties?—Then you have to think which the country will get best value for: taking, we will say, 60 men to the Staff College and training them in the duties that will enable them to do useful staff work in any situation on service, or training only half to do that and the other half for the minor duties, which, after all, are not perhaps so important. I think that is how I look at it. When I knew the Staff College we had a really practical course which did, I think, cover all the staff duties, and covered them from a practical point of view. We went into the country and went over very varied ground, the greater part of the South and East of England, during the time that they

Major-General

Major-General
Sir H. J. T.
Huddyard,
K.C.B.
19 Feb. 1903.

were there, and they worked out schemes of every kind and description: Quartermaster-General's schemes, supply schemes, railway schemes, and everything that they could, I think, really be asked to do on service. They had to think about all these things from a practical point of view, and I am sure when they were in a position of responsibility in the field (and many of them have told me so since), they found that their teaching was of the greatest possible value to them.

16053. Some men are not fitted for that kind of work; they have not got an eye for country; and yet they may be excellent people in an office for Adjutant-General's work?—Still, you would be surprised to find how much they will improve if you recognise that they are not very good at it, and take the trouble to make them learn, and if you take them over country and over ground where they can learn. I was very much struck with that when I was at the Staff College. There were weak men—I mean men whom you recognised as weak as soon as you got them, men perhaps not of great character or of great capacity; you warned them, you told them that they were weak in their work, that there were certain things that they must do, and that if they did not do them they would have to leave the college. And, really, some of those men at the end of the term, so far as knowledge and instruction went, were excellent, very good indeed, they improved enormously. Of course, you cannot alter character. If you get a man who has not a very strong character you cannot give him character, but you can teach him a great deal.

16054. But if the man who had not an eye for country could be passed through their examinations for the A work, and pass a shorter time there, you could put so many more men through the Staff College?—Yes, you could do that.

16055. That is really the question I am aiming at?—Then I should almost be inclined to wonder whether it is worth while sending them there at all.

16056. How can you tell till they get there?—You have the Adjutant-General's duties and Quartermaster-General's duties; and now we have got one Quartermaster-General's officer at Aldershot who will do the duties, I take it, that have always been done by the Quartermaster-General's branch of the Army. That means that the Adjutant-General's branch has got no duties that want a great deal of instruction; they are duties of returns and duties of parades and duties of military law which you can learn anywhere. But what I feel in my own mind is, that when you come to get on service, and you want the Adjutant-General's officers to do the work, because your Quartermaster-General's officer has gone sick, or been shot, or something has befallen him, then it will be a pity that they should not have had the same training; and, therefore, I would put them all through the same course whether they were going to be Adjutant-General's officers or Quartermaster-General's officers.

16057. Would not that difficulty be met also by passing more men through the Staff College, because you would probably have a second man then as a substitute who had gone through the Quartermaster-General's work and could take it up?—Well, they run down very quickly, I think, in war.

16058. But instead of having an Adjutant-General's man who had not really proved himself competent to do the B work, you would have a second and competent Quartermaster-General's man to do it?—Yes, that, I think, is the intention now; the one would do a portion of the work, that is the field intelligence work, and the reconnaissance work, and that kind of thing; and the other would do the rest of the Quartermaster-General's work. But if you have a campaign of any duration the probability is that one, or possibly both, will want replacing, or it may happen anyhow, and the lower you get the more you feel it. I remember in Egypt in 1882 there were two of us who were Deputy-Assistant-Adjutant and Quartermaster-Generals (as they were called in those days), with a division, and the division was detached. Then we had to divide our duties. It was very hard for one to do all the legitimate duties he had to do, because it was more really than he could do, and the other had rather less; so we arranged that we did about equal on the day's work. But we had not hard and fast lines for the duties.

16059. But what you call the Adjutant-General turn of mind is not the same class of mind as the mind that takes up the Quartermaster-General's work, is it?—

It is a little difficult when you get to that, I think. I have found that really where you have got a good capable staff officer who was a good rider, a quick intelligent man, and had a good eye for country and so on, whether he was of one branch or the other, he was a thoroughly good staff officer.

16060. That I would quite agree with?—But I think that is what you want; that is what is indispensable.

16061. That is rather what I am suggesting, that the men who are found at the Staff College after six months not to have that general capacity, but are perfectly well qualified for questions of military law and discipline (which are similar questions) should be passed out of the Staff College so as to leave more room for the practical men, the men who could ride well, and have a good knowledge of country and show a general capacity for B work?—Of course, then, you have the difficulty of putting the A man in an inferior position.

16062-3. Quite so?—That is the difficulty. Here at home in our Army possibly at times the B man has been put in an inferior position, but that had a bad effect on the B man, as it must have, directly you exalted one at the expense of the other. And really I think the more men you can have trained thoroughly the more you can employ them afterwards; the man who is best at the B duties can be employed in the B duties in war, but I would have them all trained the same.

16064. Which is more important in war, the B man or the A man?—It depends, of course, practically upon who does the operations.

16065. That is the B man practically?—He does not now.

16066. I beg your pardon. I do not mean who does it now, but under the system such as the Commander-in-Chief is introducing it would be the B man who would take up all those things?—Absolutely.

16067. Therefore he is really the man in war who is the more important?—He would be.

16068. Questions of military law, discipline, and so on, are less important than a knowledge of country?—Yes, and it is a question whether they ought to be staff duties at all. But it is a very difficult question; if you once get one branch of the staff which is above the other, the other must deteriorate very much, as I am sure you will understand.

16069. (*Sir Henry Norman.*) Do you not think that it is more expedient that all officers should enter the Staff College on the same footing and work through till they came out at the end, and that there should be no distinction?—I think so.

16070. When you have got the men passed out you (supposing you were Commandant of the Staff College) would recommend that they should be employed in such and such positions for which you thought they were most fit?—Yes.

16071. It seems to me it would be a fatal thing to have half the officers A and half the officers B; it would be sure to cause jealousy?—I do not think you would get the best value out of it. I think it is much better to train them all thoroughly, and then, if you have weak ones, some of them you get rid of, and some at the end of the time you say are useful if there are no better men available, and the rest of them you would take according to their characteristics and their qualifications, and put them into whatever suits them best.

16072. (*Lord Strathcona and Mount Royal.*) To what extent, if any, is the instruction at Sandhurst a preparation for the Staff College?—It is a preparation only in so far as it teaches the cadet the first rudiments of the military art, nothing more.

16073. So that you think it would be just as well that they should enter from the Universities as from Sandhurst, so far as the training of the Staff College is concerned?—To the Army, yes. It would not have really very much influence on that, I think.

16074. (*Viscount Esher.*) But at the present time, of course, there is competition. You admit to the Staff College by a system of competition?—Yes.

16075. Do you approve of that; do you think that is the best system?—I think it is the best system as a system.

16076. How do you test for entrance into the College such qualities as riding and having an eye to country, and so on?—The Commanding Officer, to begin with, has to be responsible absolutely that a man is calculated

to make a good staff officer, and that he has the qualifications, that he is a good rider, that he is a thoroughly good regimental officer.

16077. But do you mark all those things in the competition?—No.

16078. Then do you not see that the effect of your principle of competition is that you may very likely pass in a man who happens to be superior in book work, who possesses those qualities, and who is possibly inferior in the other qualities which you say are essential in the Staff College?—That is so. But he is in the riding school the day after he joins.

16079. But it is conceivable under the present system of competition that you may reject a man who possesses the very highest qualities that you require in a Staff Officer; is not that so?—I think it seldom happens. There have been cases where it has been mooted that an officer should be rejected, and in the cases that have come to my notice the Commanding Officer has always said, "Well, this officer has certain qualifications for the Staff; he is a very capable man, and will be of good value on the Staff."

16080. But have you ever considered whether any other system of admission is practicable?—Of course, the other system now is nomination.

16081. Yes, I know that?—Well, nomination is excellent so long as it is not carried too far. Directly you begin to nominate too many people you get a lower standard.

16082. But would it not be possible to have a system of nomination plus a qualifying examination? Have you ever considered that as a possibility?—Yes, they have to do that; that really is the system now.

16083. And do you think that such a system as that, if it was carried through in its entirety, would not be superior to a competitive system?—I am afraid not. I think that up to a certain point the nomination system is good. When you have to look round and seek to get men for nomination, then I do not know that it is. But the plan I have thought of, and I am rather inclined to do it (which would in a sense be the same thing), is that there should be no certificates, but that the Commanding Officer should be called upon to select his best officer, who has the most likely qualifications for the Staff, and send him to the Staff College. I think possibly you might do that.

16084. I suppose you would admit that the larger number of regimental officers that you can pass through the Staff College the better?—Yes, I think so.

16085. Then under present conditions if you were to attempt to increase the Staff College accommodation it would cost a very large sum of money. It has been considered, and it has been rejected on that ground?—Yes.

16086. Have you ever thought of any other means of increasing the number of officers to go through the Staff College; would it not be possible, for example, to shorten the course?—I am satisfied with this, that if you shorten the course you will lose a very valuable part of the present course of instruction. I am quite satisfied that the longer course makes for the formation of a more thoroughly trained open-minded Staff Officer. That is my own opinion. Of course, it might be for expediency necessary to do that, but you would be bringing it down to a lower standard.

16087. Are modern languages taught at the Staff College?—Not now. They were taught, and they are taught now, I think, voluntarily, but they are not obliged to take them.

16088. Is not that a waste of time at the Staff College—would it not be equally possible for officers to learn modern languages away from the Staff College?—Yes, it would. But you get great value from their learning them at the Staff College.

16089. Why?—A man is at home for a certain time, and gives his whole time to work, and it is an opportunity for learning languages.

16090. Would it not be possible to tempt an officer to learn modern languages without giving him that special instruction at the Staff College, by giving him some advantage either in pay or in some other way, if he qualified in a modern language?—Yes, if you gave him a substantial addition to his pay.

16091. That might be cheaper than doubling the numbers at the Staff College?—At the present time I forget the number of officers qualifying as interpreters in three languages only.

16092. But those are very difficult languages. What are they?—Russian, Turkish, and Arabic, and they were carefully selected on account of the very few officers we had who knew Russian in 1885, when, I think, they were introduced; there are not very many, and they have cost a great deal.

16093. I am only suggesting to you things the effect of which, if carried out, might possibly increase the capacity of the Staff College. Take what you call a practical course: is there not a great deal in that of practice in knowledge of ground, and so on, and could not officers be trained away from the Staff College cheaper than they are trained at the Staff College in those respects, say on Salisbury Plain or anywhere you like. You have courses now in musketry and courses in engineering, and all sorts of courses which take place at different places. Would it not be possible to have a course of practical instruction for Staff Officers, not necessarily at Camberley?—I think it would be quite possible if you make efficient schools at those places, but it means instructional staff, and it means quarters, and it means stabling, and it means establishments generally.

16094. But it does not mean necessarily theoretical teaching in the building?—But there is very little theoretical teaching in the building at the Staff College. They are out and about in every county of England half the year. The most valuable part of the teaching is done by the staff rides in Essex and in Sussex, and in every part of the country.

16095. But then if that is the case, why should it not be possible in those great camps like Aldershot and Salisbury Plain to have always a course going on?—We cannot do it in a course. We should have to have a regular school for it; it would not save money. We are constantly training in these places now in the form of staff rides. A staff ride is what educates the officers in ground, and the more of them we have the better; and from the Staff College, where we have the machinery and the selected men to go out with the officers on the ground, we can teach it better than we can anywhere else. Of course, if we detach those instructors, and can get equally good ones elsewhere, we can do it elsewhere. But we cannot. What does Sir Evelyn Wood do when he wants to have a good staff ride for instruction for his officers? He asks the Staff College to lend him officers of its instructions staff, because he knows that they will do the instruction in that work well and thoroughly, and the results will be good.

16096. Supposing, then, we admit that it is desirable to increase the number of officers who are training for the staff, do you think there is no solution except increasing the capacity of the Staff College?—I would not say that. I think it is possible that we might have men attached to a course at the Staff College, and let them take a partial course in training, so long as we do not interfere with the permanent training of the men we have there now; I think we might do that. I think they would learn a certain amount there.

16097. And you think that experience has shown that no course shorter than two years would really make an efficient staff officer; is that your opinion?—That is my opinion. Of course, the Staff College has not always been praised, but if you look to the record of the men in the war in South Africa who have been trained at the Staff College you will find it a very good one. You will find column commanders Staff College men; you will find the chief staff officers Staff College men; you will find commanders of regiments Staff College men, and mounted infantry commanders Staff College men; all doing good work. And I think when that is so it shows that the body of men trained at the Staff College is a good body, and that the results of the actual course there are good.

16098. (Chairman.) With regard to supplies, I do not think there is anything to be added to what you have said?—No, I do not think there is. We were very well off where I was, of course.

16099. Or with regard to transport, except that I should just like to ask you whether your transport was regimental transport as a whole?—Yes, it was.

16100. Are you in favour of regimental transport?—I am in favour of regimental transport whenever we can afford to have it. The difficulty is that we want so much transport; that if we have regimental transport as well as the general transport we want so much, but certainly with the Natal force the regimental transport had the effect of allowing the troops never to be without their food. I do not say it would have been so on every

occasion; and when the time came that the regiments were more permanently located, and not moving about so much, then we took their regimental transport away from them.

16101. And used it as general transport?—And used it as general transport. Really it is very much the same in the end whether we have the regimental transport and on occasion use the regimental transport as general transport, or whether we have a larger general transport and use it for regimental transport whenever it is wanted. The regimental transport is the more luxurious of the two.

16102. With regard to the Medical and Engineer services, you do not wish to add anything?—No, I do not think so.

16103. Then as to guns, it is admitted, is it not now, that we must have longer range guns?—Yes, that is so; they are actually introduced really—the heavy batteries.

16104. But, subject to that observation, is there anything that you wish to say about the guns that were used in the war?—No, there is nothing further.

16105. You say that the naval guns, while they had longer range, were seldom effective on account of the impossibility of accurate ranging and observation of the target?—I would modify that rather. I would not say they were seldom effective, but that the result was very much modified by the difficulties of observation.

16106. What does that mean?—That the difficulties of observation led to the results not being as great as they might have been.

16107. But what was the difficulty of observation?—They never had a target.

16108. The Boers did not offer a target?—No, you never knew where they were.

16109. But the lyddite shell, you say, did not cause much actual damage?—No, the lyddite was a disappointment as a whole, I think; the Boers got accustomed to it.

16110. (*Sir Frederick Darley.*) What do you mean by "the unevenness in the propelling power of the charges"?—That was how they accounted for it, and particularly with the Navy, I think. I remember getting a gun up on one occasion in a hurry, and the first shot went right into the middle of what we wanted them to fire at, but they fired for half an hour afterwards without one shot going near the same spot.

16111. It did not range so far?—No, it ranged unevenly—the ammunition.

16112. Was that cordite?—Yes. I suppose it was climatic influence really.

16113. Do you know where that cordite came from?—I do not know.

16114. (*Chairman.*) You think it is dangerous to base specific conclusions on a war of the character of that in South Africa?—Yes, I think so.

16115. Especially with regard to Cavalry, because there was no regular Cavalry employed against us?—Yes.

16116. Still, mounted men will be required?—Yes, and cavalry will be required. What I would mean rather to say by that is, that we should not say that mounted men generically have taken the place of cavalry, and shown that they can take the place of cavalry in future, because I think even as it was the cavalry there did very good service indeed, but not having had any regular opposing cavalry, the necessity for their services was not so apparent as it would have been otherwise.

16117. But the importance of mounted troops has been shown quite enough to make it necessary to organise those troops in any part of the Empire where we can get them effectually?—Yes.

16118. (*Sir Henry Norman.*) Had you much mounted infantry under you at any time?—We raised a good deal, and they did very good work, but they require some time to train. We had all the frontier to the east which we defended with mounted infantry, and they did excellent work.

16119. (*Sir Frederick Darley.*) Were they taken from the regiments you already had?—Yes.

16120. (*Sir Henry Norman.*) Could they ride fairly well?—They rode very pluckily, but, of course, the horses out there did not want much riding; there was not too much kick about them.

16121. (*Chairman.*) With regard to infantry you recommend the use of broad fronts?—Yes, I think that was the real lesson—the use of broad fronts.

16122. And that means greater training?—Yes.

16123. So that the men may act and the officers may act individually?—Yes.

16124. Is there anything else that you wish to add?—No, I think not.

16125. (*Viscount Esher.*) There is one question I want to ask you. You know the report of Mr. Akers Douglas's Committee (*the Committee appointed to consider the Education and Training of Officers of the Army, Cd. 982, 1902*)?—Yes.

16126. I dare say you remember the paragraph in which the committee say by "no part of the evidence laid before them have the committee been more impressed than by that which shows in the clearest manner the prevalence among the junior commissioned ranks of a lack of technical knowledge and skill, and of any wish to study the science and master the art of their profession. Several causes appear to have combined to bring about this state of things, the gravity of which cannot be exaggerated. From the evidence laid before them the committee are driven to conclude that the dominant cause is that the promotion of the young officer is not dependent on the zeal and ability which he may show." Do you not think it might be desirable in the promotion of young officers to the rank of lieutenant or captain to take into consideration the work they have done by passing through the courses of different kinds—departing, in fact, at that stage of their career from promotion purely by seniority?—It is a dangerous thing to do. The British youth develops very slowly very often—that is our difficulty. We want to get them young, because they are more adaptable; we get them young, and then they take a long time to develop. We like a University candidate, because he has developed to a certain extent, and he comes and he gets a grip of whatever he has to do—he has got a broader mind, partly because he is older. I think myself that it is desirable to have a certain proportion anyhow who are older than those we get at the present time.

16127. But, you see, the words that they lay special stress on are "zeal and ability." Can you think of any particular way or method of improving them?—Yes, I can think of ways and methods; the difficulty is to say really whether your ways and methods will prove better than what has already been done. But what has led a great deal to all this examination. The young officer has to go up for certain examinations, and it is done really always outside the commanding officer. When a second lieutenant goes up for examination in what they call A and B, which is regimental duties and drill, he is examined by a board, with a couple of officers of another regiment. From my point of view the commanding officer is the man really to be responsible for those young officers' teaching. He is the man who is most interested in their knowing their drill, and the interior economy of the arm, and doing their duties properly; but by the examination he is deprived more or less of any authority in the matter. Therefore, I would say (under reservation so far as not having put it forward as a practical proposition) if you can abolish the examination, and if you can make the responsibility of the commanding officer real you will get the officer to know more about his work. That is my feeling with regard to A and B. Then when you get on to the examinations in the higher rank, the same thing applies equally with the reservations. You must have your company commander the real person—he must be there as the company commander whom you hold responsible for certain things, and he must teach his young officers, and he must see that they come up to the standard required by the commanding officer.

16128. And would you make their promotion dependent upon that?—Yes, certainly, and I would make it dependent upon the commanding officer putting them forward as fitted in every way for promotion, not to the rank of captain, but to the rank of company commander, to the command of a company in war, and then you can put whatever pressure you like, or inspection if you like, through the general officer of the brigade or the commanding officer, and through any machinery you choose to create, on the general officer. But that is the only way, to my mind, that you can get a real responsibility for the instruction of officers; you must have the officers with their companies, and you must have the men in the ranks.

16129. (*Sir John Hopkins.*) Had you the 4·7 gun with you at all?—Yes, several.

16130. Were you satisfied, as a rule, with the firing from that gun where they could get at and see their object?—It was uneven, as I was saying. It was represented to me to be owing to the charge—that the ammunition rather deteriorated, or, at any rate, got unequal in strength.

16131. It is affected in various ways; it is affected even by the heat of the day; it will fire differently in the morning from what it does at noon, and so on?—Yes.

16132. But so far as you could judge from the circumstances of the case the firing was as good as you could expect, taking that into consideration?—Yes, I think so.

16133. And were the shells effective?—Yes.

16134. They had lyddite shells, I think?—Yes, and they fired an enormous quantity, but the difficulty was that you had to fire an enormous quantity before you were likely to get any result.

16135. Did you hear any complaints about the erosion of either the 4·7 or the 12-pounder gun?—No; during the time that they were with us they were all right.

16136. And did the 12-pounder turn out a serviceable gun?—Yes. I did not care much for the 12-pounder gun.

16137. It is supposed to have a very much better range, a range of 8,000 yards, against the field artillery range of 5,000 yards?—Yes, but it has not got the range for shrapnel, and that is the point.

16138. You wanted the shrapnel with the longer fuses really?—Yes, that is what we wanted.

16139. (*Lord Stratheona and Mount-Royal.*) Of the machine guns which did you consider the most serviceable—the Maxim or the Colt?—I think the Maxim is the best all round gun myself, though it is not so portable, of course, as the Colt. The Colt may be better with mounted troops.

16140. With regard to the so-called galloping gun, was it very useful?—Yes, it was of great value certainly.

16141. In many cases was it of greater value than those carried on tripods?—Yes, I think it was with cavalry.

16142. And more particularly, I suppose, in the Free State and such open country?—Yes, I dare say it was.

16143. (*Chairman.*) Is there any incident in connection with the military operations to which you wish to call attention?—There is one point that I see in the staff diary of the 2nd Brigade on which I think I was misled, and it is a point which has created a certain amount of interest, viz., as to the guns at Colenso, and the loss of the guns. I have put down in the Staff Diary that owing to the guns having come under heavy rifle fire at a distance of 400 yards they were put out of action. That was our impression at the time. Of course, we went back, and we left the guns where they were, and that was our impression. But, from my general knowledge afterwards, and going over the ground and talking to the Boers who had been there at the time, and so on, my impression now is that the fire that had put them out of action was 1,300 yards, and not 400. It is rather an interesting point.

16144. (*Sir George Taubman-Goldie.*) From where?—From what they called the Red Kopjes, on the other side of the river. I could not find cartridges or trenches or anything where we had supposed the Boers to be at 400 yards. But the effect of the fire was equally effective at 1,300 yards; it put them out of action. But that made it much more difficult, of course, to meet their fire.

16145. Those bushes were not lined?—Not at all.

16146. (*Viscount Esher.*) Not on the near side of the river?—No.

16147. Your impression was that the fire came from the near side of the river?—That is so.

16148. (*Sir Frederick Darley.*) Were they firing from the near side?—I cannot find that they were; it is rather an interesting point.

(*Chairman.*) I think we had evidence just the other way the other day.

16149. (*Sir John Edge.*) How soon after this affair at Colenso did you go over the ground to look for cartridges?—It was not very long afterwards. Colenso was fought on the 15th December, and it was when we were going there again, when we went up and did get in; about a couple of months afterwards, I suppose.

16150. Did the Kaffirs carry away the cartridges?—No, and you know you find cartridges in the ground a long time afterwards.

16151. If they are not carried away, of course, you will?—Yes.

16152. (*Sir Frederick Darley.*) Were there any trenches there?—No.

16153. (*Viscount Esher.*) Was the river fordable at that point?—It was fordable with difficulty.

16154. They would have had to swim?—They could have got across a drift there.

16155. (*Sir Frederick Darley.*) You saw no marks of men having been there for any time?—None.

16156. (*Sir John Edge.*) Do you know where the Boers came from to that donga where our men took refuge?—They came from the other side of the river. They had a bridge; it was broken down, but they had a footpath there where the men got across, and they came by that footpath down to the donga where our men were.

16157. (*Sir Frederick Darley.*) How did they get the guns away; in what direction did they take them away?—Nearly due north.

16158. Was there any drift that they could get the guns across there?—Yes, there is a drift there, not very far from the bridge. I do not know whether they went over that drift or not, but there is a drift there.

16159. That they could get the guns across?—Yes.

16160. (*Chairman.*) Were you in command at that time?—I was in command of the 2nd Brigade.

16161. Was your brigade present at that particular spot?—At Colenso, do you mean?

16162. During those operations when the guns were taken?—Yes, it was at the battle of Colenso.

16163. And you were there?—Yes, we were there.

16164. Near the guns?—Yes, we covered the guns. I sent up the regiment to get between the railway and the guns, and cover the guns by their fire, which they did.

16165. And were you in a position to see these bushes at that time?—Yes.

16166. And you were under the impression that the fire did come from them?—Yes, we all thought that.

16167. (*Sir Frederick Darley.*) What was the objective of your men's fire on that occasion?—The objective was at those kopjes on the other side of the river.

16168. 1,300 yards away?—Yes.

16169. That is what your men were firing at?—Yes.

16170. Was there any fire at the place where they thought the Boers were, on the south side of the river?—I did not see any.

16171. (*Chairman.*) Did none of our men fire at the bushes?—I do not think so. I should not be prepared to say that.

16172. (*Sir Frederick Darley.*) But the bulk of the fire was at the 1,300 yards' objective?—Yes, I believe it was almost all there.

16173. (*Sir George Taubman-Goldie.*) Of course the Boers were using smokeless powder?—Yes, the Boers used smokeless powder that you could not see. But what really happened I think was this, that Colonel Long with his guns went forward to this position, and when they got into action, they swept the kopjes—those red kopjes—and the Boer was unable to fire. And then when he finished his ammunition he could not get up more ammunition, and the Boers got into action again, and put the guns out of action, but I believe, from all inquiries I made, that it was at 1,300 yards. It shows the efficiency of fire in that clear atmosphere where you have a clear target. Of course all these guns were lying out under the sight of the kopjes.

16174. Could they have got the guns away that night?—They could have got the guns away that night by remaining there till night in the positions they were in. The reason that was not done was that the Commander on the spot saw that the men were exhausted, and saw what they would have had to undergo, from want of

Major-General
Sir H. J. I.
Hildyard,

water, the sun, and so on, if they had lain out there all day, and he ordered their withdrawal.

16175. (*Lord Strathcona and Mount Royal.*) Would there have been much danger in remaining in that position?—Oh, we should have lost men. If we had not tried to move, I do not suppose the losses need necessarily have been very great, but the physical suffering, no doubt, would have been great, because it was a very exceptionally oppressive day, and, lying in the sand there was very trying work.

16176. (*Chairman.*) What I understand is that, so far as putting the guns out of action, the difference of range that the Boers fired at does not, in your opinion, make much difference?—It did not make any difference.

16177. It was just as effective?—Just as effective. The volume of fire that came from this place was extraordinary.

16178. (*Sir George Taubman-Goldie.*) But, as regards removing the guns at night, that would make a difference; the Boers would have had to cross the river and come 1,300 yards?—Yes, if we had remained on the spot where we were, there is not the slightest doubt that the guns would have been removed that night. It is all a question of comparison as regards the evils, and, in the judgment of the man on the spot, which, after all, has to be made on the spot at the time, he thought that, in the interests of the men, it was better to withdraw them.

16179. (*Chairman.*) Is there any other incident in your experience that you would wish to mention?—I do not think there is, what I should call, a debatable incident like that.

16180. (*Sir George Taubman-Goldie.*) Have you anything to say about Willow Grange?—It might be as well to say that, first of all, I left Southampton with the whole of the Brigade as forming a part of the First Division, which was to land at Cape Town, and until I got to Cape Town I supposed that that was the destination of the Brigade. When we got to Cape Town I went on shore and saw Sir Redvers Buller. He told me that Ladysmith had been invested (which we had not known), and that there was nobody in Natal to speak of, and that I had better go on with my Brigade to Natal. I would like to say here that before that, to my knowledge, the intention of Sir Redvers Buller was to move on the Orange Free State side, that is where he

meant to go forward, and Natal would have been a subsidiary business. However, this had happened in Natal, and he thought, in all the circumstances of the case, that he had better send my Brigade on to Natal, so I went there. He told me that he would reinforce me shortly, and General Clery was coming on at once. We got to Natal on the 12th of November, I think, and went straight up to Pietermaritzburg. My intention then was to concentrate at Maritzburg, but the other regiments of the brigade had not arrived; so I went up with the regiment with me, and eventually took it up to Estcourt, where there was a garrison under Colonel Wolfe Murray, who was commanding the communications. My intention then was to concentrate the rest at Maritzburg as they arrived, supply them with transport, and move the brigade up as a whole to Estcourt. I waited at Maritzburg till General Clery arrived there, and then I went up with the rest of the brigade, except one battalion, to Estcourt, and being at Estcourt, what I felt to be my position was that I must remain at Estcourt under all conditions, so as to hold out a hand to Ladysmith if Ladysmith got through; if they broke out of Ladysmith, I thought we ought to be on the spot at Estcourt, and at the same time at Estcourt we covered the concentration of the troops coming up behind. That was the situation. Then the Boers sent a force down under Joubert and avoiding Estcourt, came down to Mooi River. General Barton had got there, and had troops there which he was assembling; and what I hoped to do was to attack the Boers at the same time as General Barton did from Mooi River, and I tried to arrange that; however, it did not come off. But there was a gun and a laagar between him and me which I attacked, and we were very unfortunate in the weather; there was a terrible hail-storm which led to great difficulties in every way, physically and otherwise; the gun was removed, and the surprise was not as complete as we had hoped it would be. Looking to all the circumstances of the case, I thought then it was better, instead of remaining there between Estcourt and Willow Grange, to take the force back to Estcourt, so as to be concentrated there ready to move either way, and that was what I did. I would wish to say that the situation at this time was made more difficult by the absence of maps of any description of the country south of the Tugela and of any properly organised intelligence service. I do not think there is anything else I wish to mention.

THIRTY-NINTH DAY.

Friday, 20th February 1903.

PRESENT :

The Right Hon. The Earl of ELGIN AND KINCARDINE, K.G., G.C.S.I., G.C.I.E. (*Chairman.*)

The Right Honourable The Viscount ESHER, K.C.B., K.C.V.O.
The Right Honourable The Lord STRATHCONA AND MOUNT ROYAL, G.C.M.G.
The Right Honourable Sir GEORGE DASHWOOD TAUBMAN-GOLDIE, K.C.M.G.

Field-Marshal Sir HENRY WYLIE NORMAN, G.C.B., G.C.M.G., C.I.E.
The Hon. Sir FREDERICK MATTHEW DARLEY, G.C.M.G.
Admiral Sir JOHN OMMANNEY HOPKINS, G.C.B.
Sir JOHN JACKSON.

BERNARD H. HOLLAND, *Secretary.*

Major-General G. BARTON, C.B., C.M.G., called and examined.

Major-General G.
Barton,
C.B., C.M.G.
20 Feb. 1903.

16181. (*Chairman.*) You have been good enough to notes (*vide Appendix, page 657, post*), upon which I will ask you questions. You held a command in the South African War, I think?—Yes. I commanded the 6th Infantry Brigade, which was mobilised at the commencement of the war.

16182. Was it one of the brigades that was in the 1st Army Corps?—The brigade was not in the Army Corps, because it was composed of four battalions that were got together to form a brigade; it was not one of the complete brigades at Aldershot, nor was it a complete brigade in the Army Corps at that time. Four battalions were brought together and formed into one brigade, and I was appointed to command it at the time of the mobilisation of the Reserves.

16183. You mean according to the scheme of mobilisation, it was not one of the brigades; but it was one

of the brigades that went to South Africa?—Certainly.

16184. And it went to Natal, I think?—It went to Natal. I arrived at Durban myself on the afternoon of the 17th of November.

16185. And you served in Natal up to the relief of Ladysmith?—Up to the relief of Ladysmith, until the 9th of April. Then I went to the Cape Colony.

16186. And then you took part with the 10th Division?—I took part with the 10th Division in the operations in Kimberley, in connection with the relief of Mafeking, and the occupation of the Western Transvaal.

16187. Was that under Lord Methuen?—It was under Sir Archibald Hunter. Lord Methuen was acting in co-operation with us in the Orange River Colony, I believe at Boshof.

16188. That is what I was thinking of. Are you of opinion that the force which was designed for the campaign was an adequate force?—I do not think it was sufficient, considering that the whole of the Boer forces were mounted; and looking to the enormous distance from the base, either from Natal or from Cape Town, I do not think it could possibly be held to be sufficient, as it was almost certain that the Orange Free State would join forces with the Transvaal.

16189. It is on that assumption that you think the force was inadequate?—And also on account of the doubtful loyalty of the Dutch in Cape Colony and in Natal. They were sure to be in sympathy with the Boers, even if they did not actively support them.

16190. You are speaking now of numbers?—Yes.

16191. Did you ever form any idea in your own mind what numbers would have been required?—I cannot say that I did before the war.

16192. But I mean, from your experience in the war, what number do you think would have been required?—I could not say that I have actually formed any estimate of the number that would have been required. I have never actually considered it.

16193. But for the proper defence of the Colonies from an invasion of the Boers a much larger force than was in the Colonies before you arrived was, in your opinion, necessary?—Yes, I think undoubtedly necessary.

16194. And with regard to the Army Corps itself, was that a sufficient reinforcement?—So far as I know, the only force in South Africa before the Army Corps went there was the force in Natal. With the exception of one battalion, or two, perhaps, in Cape Colony, the main force was under Sir George White in Natal, and, so far as I am aware, that was the only force actually in the Colony.

16195. But the question I put was whether you thought the Army Corps was a sufficient force to send out to reinforce the forces that were previously to that time in the two Colonies?—I do not think so, because the Boers, in sending their ultimatum, certainly intended to take the advantage of being on the spot and of the great distance that we were from home, to strike a decisive blow, and settle the matter altogether, before we could get a sufficient force in the country.

16196. Then when you arrived in Natal the main force was enclosed in Ladysmith?—Yes, they were shut up in Ladysmith when I arrived, and had been for some considerable time.

16197. That being the consequence of there not having been a sufficient force previously?—Certainly.

16198. But in the *précis* which you have given us you say that the force would have been sufficient if the Cavalry had not been shut up in Ladysmith. What do you mean by that?—In answering the question in the memorandum (*Vide Appendix, page 575, post*), that was sent me by the Secretary to the Commission, I referred to the force in Natal, meaning that the force that was landed by Sir Redvers Buller in Natal would have been sufficient for the purpose we had to carry out, provided that we had had the Cavalry that were in Ladysmith. But I do not wish to criticise the fact of the Cavalry having been left in Ladysmith. I merely remark that had we had that Cavalry, I think we should have had sufficient to carry out Sir Redvers Buller's intentions at the time of Colenso—that is what I was referring to—without the assistance of another division, which was afterwards waited for, Sir Charles Warren's division. I say that the force that was in Natal at the time that the other reinforcements arrived there would have been sufficient to carry out the relief of Ladysmith and clear the Boers out of Natal, provided we had had that Cavalry from Ladysmith.

16199. Or you might put it in another way—provided you had had the same amount of Cavalry from home?—Certainly, if we had had the same amount of Cavalry from home; but, of course, the raising of a mounted force took time and caused considerable delay. I think there were only 300 mounted men outside of Ladysmith the day I landed.

16200. Were they Irregulars?—They were various. There was a squadron of Imperial Light Horse raised in Johannesburg; there was a force of Natal Mounted Police used for military purposes; there was a Mounted Infantry company which, I believe, had come down from Ladysmith; and there were a few details, making

up, I believe, altogether about 300 mounted men at Estcourt. They were the only mounted men outside Ladysmith at the time I landed, but on that same day Colonel Thorneycroft got together 230 men also. That was the only mounted force in Natal outside of Ladysmith on the day I landed.

16201. Colonel Thorneycroft did enlist more men afterwards?—Yes, it was increased afterwards.

16202. You have been good enough to give us some heads with regard to the quality of the men?—Yes. I think the quality of the men, speaking of the Infantry, was excellent.

16203. You are speaking in general terms there?—I am speaking generally of all the Infantry that I came across. With regard to my own brigade, I think they were excellent; their physique was very good, their morale was excellent, their shooting was very good, and their marching was extraordinary—wonderfully good.

16204. (*Sir Frederick Darley.*) What regiments had you in your brigade?—I had the Royal Fusiliers, the Royal Scotch Fusiliers, the Royal Welsh Fusiliers, and the Royal Irish Fusiliers.

16205. (*Chairman.*) And they had all come from home?—Yes, they had all come from home.

16206. Were there many Reserve men in those regiments?—Yes. I should think certainly more than half of the men were Reservists. I could not say exactly, although I can easily obtain information upon that point from the depôts of the corps.

16207. Did you find any difference between them and the other men?—No, I cannot say that we found any difference. The first Reservists we obtained were extremely good men.

16208. Were they quite fit for the work?—Quite fit for the work; they were the men of between seven and twelve years of service, in their very prime, the very best period of their service, probably. They had completed seven years in the Regular Army, and joined the Reserve; they had not yet completed twelve years since the date of enlistment.

16209. (*Sir Henry Norman.*) But their shooting was not so good?—When I say in my *précis* that their shooting requires improvement, what I mean is that I think the Reservists should have more opportunity of shooting than they at present have had. Since many of these men left the colours we have had a new rifle, and when we had the new rifle—the Lee-Metford—given to us our Reservists were called up to do training, but it was only two days' or three days' training, and that was the sum total of it; and I consider that the Reservists should have some opportunity of having rifle practice. That is what I meant by improvement.

16210. Ordinarily they do not have rifle practice?—Ordinarily they do not have it. There is no regular system of the Reservists in the country having annual practice in rifle shooting.

16211. (*Sir George Taubman-Goldie.*) There would be a practical difficulty rather in getting men away from civil employment for that purpose, would there not?—I think no doubt there would be difficulty. I am only speaking from a military point of view, of what I consider necessary; you want to keep the eye in by a little practice. We are constantly changing the system of firing, and constantly getting new rifles.

16212. I believe when we got our new Lee-Metford rifle the Reservists were called up?—Yes, they were when we had the new rifle. When the new Lee-Metford was issued the Reservists were called out, as I have said already, for, I think, two or three days' training in the handling of the rifle. I think it is very doubtful whether they then did any firing with it in many cases; some did, no doubt, but I am speaking as to the making of the Reservists permanently more efficient. I consider that they should have some opportunity of rifle shooting annually.

16213. (*Chairman.*) Could you trace any difference in the shooting of the Reservists and the others?—One is hardly able to judge of that.

16214. (*Sir Frederick Darley.*) They might be called up entirely ignorant of the weapon they had to use, if it was a new weapon?—Certainly.

16215. (*Sir Henry Norman.*) You thought our men shot better than the Boers?—I think our shooting was quite as good as that of the Boers. When there were Boers firing at us we could always move them, although

Major-General G. Barton,
C.B., C.M.G.

20 Feb. 1903.

Major-General G. Barton,
C.B., C.M.G.
20 Feb. 1903.

we seldom had a target in the attack. If it was a case of merely shooting at one another from any point, we could generally move them; you could tell by the sound; you very often could not see, but you could tell fairly well by the sound. We did not consider that the Boers shot so extraordinarily well; we thought they shot very badly; we gave them very good opportunities of shooting us, and they gave us very few opportunities of shooting at them. I do not consider that they were good shots. I think that if we had changed places, and the Boers had attacked the places we attacked, we should have made far more effective shooting.

16216. (*Chairman.*) When you say you gave them more opportunity, you mean that you attacked places?—Yes, we attacked places. You have no target when you attack under the present conditions of smokeless powder in a country like Natal—you do not see anybody. If you are attacking a ridge you do not see anybody, with smokeless powder and their being so extraordinarily well trained by nature and habit to lie still. Very often our men move about a little too much when they are defending a place.

16217. Was there a difficulty in getting your men to take cover?—I do not think there was difficulty in getting them to take cover.

16218. They did not take it spontaneously then?—I think they took cover. It depends upon whether you are speaking of attack or defence; the two are somewhat different. I think they took cover wherever it was advisable. I think they were led to do so and taught to do so by their officers quite as much as was useful. A position cannot be gained without some exposure.

16219. I am only putting to you the result of evidence that we have had, that there was a difficulty in getting the ordinary British soldier to take as much cover as his opponent did; he did not take cover in quite the same intelligent way. That is not your opinion?—The circumstances were so different. The Boers did not attack us generally in Natal; we always attacked, and therefore the Boers were always hidden, and they always had already taken up their positions some time beforehand, and their positions were not revealed to us either individually, or even the extent of the position was not revealed by anything we could see. That is why they naturally had superior cover to ours; they were better able to take it, and undoubtedly they are better trained. Even if we put men into a defensive position, our men are not sufficiently careful to keep still, and they have not the same natural training and habits that the Boers have.

16220. But do you not think that a good deal could be done by the officers giving them proper directions?—I do not consider that we have very much to learn in that respect.

16221. (*Lord Strathcona and Mount Royal.*) The evidence we have had is to the effect that our men were not observant of the inequalities of the ground, and that they might have taken cover in many instances when they did not avail themselves of it?—Well, I should like to say that our attacks certainly were carried out with the most extraordinary courage and bravery that it is possible to conceive. Nothing could have been finer than the advance of the 2nd Brigade at Colenso, for instance, or of my fusiliers who went to support Long's guns, or of my brigade storming Pieter's Hill. It would have been absolutely impossible for the men to have advanced and taken cover; they would never have got forward at all.

16222. (*Sir Frederick Darley.*) You cannot do both; you cannot advance and take cover?—You cannot advance across the open and take cover also, but I think when it comes to attacking a ridge, what we have always trained our men to do, is that we advance by successive sections, or by separate small parties, and then while one party is lying down firing, another party rushes forward a certain distance, and then lies down, opens fire, and enables those behind to come up and get forward again, and I think in that respect our men did very well indeed. If they had sought cover more I do not think we should have gained any position at all; it would simply have been a matter of lying down and shooting at one another at long ranges, and not seeing one another.

16223. (*Chairman.*) Do not take it that I was suggesting in any way that they did not show splendid courage in advancing. I was only asking whether, considering the conditions of modern warfare, owing to the nature of the recruit as competent as his opponent

to adapt himself to those conditions?—My answer to that would be that the circumstances were so different; that we attacked in Natal, and the Boers held positions nearly always carefully prepared some time beforehand, and that when you are attacking you have under present conditions no target; you have nothing to shoot at. There is a crest line where you know pretty well that the enemy must be, and that is about all you get.

16224. And if you want to get forward you must expose yourselves?—You must expose yourselves; and it is on that account, I may say, that I have made the remark in my précis that I think it is a mistake to attempt to take only one position. I would always try to take at least two or three positions simultaneously.

16225. Do you mean in attacking?—In attacking. I would always try to take two or three points in the enemy's position.

16226. (*Sir George Taubman-Goldie.*) So as to prevent his concentrating?—So as to prevent his concentrating. I am sure it is a bad thing to let him concentrate all his attention on the one party. What I have said is, "More stress should be laid on combined tactics and simultaneous attacks of different bodies on several separate points." May I tell you my reason for putting that in?

16227. (*Chairman.*) If you please?—In the last issue of "Combined Training, 1902," which was published last year, and is supposed to have been based on our experiences, the following occurs:—"The best type of an offensive battle is a methodical progression from point to point, each successive capture weakening the enemy's hold on his main position, and paving the way for a decisive advance." That I think represents rather the misfortune we suffered from on two or three occasions in Natal. At Colenso, General Hart's Brigade attacked on the left, and General Hildyard's Brigade was to have attacked at the same time, but, I believe the orders were altered.

16228. (*Sir George Taubman-Goldie.*) You would have simultaneous attacks?—Certainly, if you are going to attack a long position, I would have simultaneous attacks on several points. In the same way in the latter stages when General Hart attacked, what is now known as Hart's Hill, he attacked alone; the place had been very severely shelled, but he attacked alone; and in the final attack of all, when I attacked what we thought was the left of the Boer position at Pieter's Hill, I went down the river bank for two miles, and then ascended the hill and attacked what we thought was the Boer left. It was not the Boer left, because I was a long way out-flanked but I attacked alone. I was told that two other brigades would attack on my left two other points further west, but those two other brigades did not attack until four hours after I attacked my hill, and therefore I had an immense amount of Boer force thrown upon me, and they were able to move their guns out and attack me from three sides.

16229. The Boer showed extraordinary readiness in transferring himself from one side to another?—Yes, certainly. The moment I got on the hill they galloped across from other parts of the line to reinforce the place I was attacking. I had only infantry, and, of course, they had the advantage. That is one point that I should like to make when talking about cover: that that hill would never have been captured if I had not impressed upon my officers that it was absolutely necessary for us to push forward rapidly, and not let the Boers (as they had so frequently done before) increase their numbers as they saw us coming. If we had gone slowly we should never have taken the hill at all; and I believe that we had less loss by that. We had very serious loss afterward, of course, because, as I say, the Boers reinforced the left of their line as they simply saw my brigade isolated away from the remainder, and without guns. They moved their guns out and attacked me on three sides.

16230. (*Chairman.*) But you say the chief deduction as regards future training is more independence for Commanding Officers and company leaders?—Certainly.

16231. Does "Commanding Officers" mean Commanding Officers of battalions?—Commanding Officers of battalions. I think the Commanding officer of a battalion should be given very much more scope for training his own men.

16232. Do you mean in the method of training?—I think in the method of training, and also he ought to be left more to his own control.

16233. You are speaking of training, not of action?—Training for war. I refer to it in this way; there is very little ground certainly in England for the Commanding Officer to train except at some of these large camps, and there the Commanding Officer does not have as much opportunity to handle his own battalion as I think he ought to have.

16234. (*Sir George Taubman-Goldie.*) But you would have a uniform method, a uniform drill book, would you not?—Yes, you must have some forms, of course.

16235. It is more independence in action in the field that you mean, is it not, rather than in the method or procedure?—I think we are rather tied down to hard and fast rules. It is the same with shooting; there are hard and fast rules there. Men differ very much. If you have to take a party of one hundred men through a particular course some of those men do not keep up with the others. You want to have a little more latitude for the captain to train his men, but if you have orders coming from the Commander-in-Chief as regards shooting, and then from the Divisional General, and then the Brigadier General, and the Colonel, then what the captain rather feels is, how can he be judged by results if he has so little scope?

16236. (*Chairman.*) Then it runs on to very much what you say at the beginning of the next paragraph, that staff officers and staff duties are too much introduced into the training of regimental officers?—Yes, I think that is so.

16237. Do you mean by that just what you have been saying?—I think that the staff are constantly supervising the training of companies and battalions when very often some of those staff officers have not had the personal experience that many of those captains and colonels have had in actually training the men.

16238. Do you think that an efficient staff is selected from the first-class regimental officers?—I think it should be. I think, undoubtedly, the work would be a great deal better done if there was more sympathy between the staff and the regimental officers, and I think that is only obtained by staff officers constantly going back to regimental work; it keeps them in touch with the various changes of the men; there are a great many changes as regards the enlistment of men. When I first entered the army we had men who served twenty-one years, then when it came to having men who only served for very short periods the whole thing was very different, and therefore I think that staff officers should constantly revert to regimental duty—that they should have periods of regimental duty and then periods of staff duty, because then they would constantly keep in touch with regimental feeling, and especially with the improved knowledge and intelligence of the men who come into the ranks. Very often now staff officers get a staff appointment, and as staff appointments are very much more valuable financially and help to give a better position than regimental work, if an officer is a very good officer, he remains in staff employment for a certain number of years.

16239. That you consider a mistake?—A great mistake, I think, from the point of view of the Army. I am not thinking of the benefit of the individual. For the benefit of the individual, probably, to go from one staff appointment to another is a good thing. The rule exists that he should go back to regimental work, but I am afraid it is not often enough put into practice.

16240. Do I rightly understand this to mean that you think he would really be a better staff officer if he did go back to regimental work?—Yes, certainly, I think so. I think he would be constantly kept in touch with the feelings and wants of the men.

16241. And, therefore, there is no real hardship upon him; there may be pecuniary considerations, but there is no hardship upon him in his service?—Certainly not; it cannot be a hardship to him.

16242. That is the system that you think ought to prevail?—I consider it ought to prevail, and that if the Commanding Officer obtains command of a battalion, I think he ought to complete his time in command of the battalion; it gives him much more valuable experience for what he may afterwards have to do on the staff, whereas now very often, if an officer is considered a good officer at headquarters, he is given command of a battalion, financially not a very good position, and, perhaps, at the end of one year, or 15 or 18 months, he is put back again on the staff. He would be a far more valuable officer in the Army if he had completed

his four years in command of a battalion or regiment of cavalry.

16243. Were you satisfied with your staff in South Africa?—Yes, perfectly. I had only one staff officer—the Brigade Major; he was killed; then, of course, he was replaced by others, but they were all good officers that I had. One was a Staff College officer, and two others were not Staff College officers.

16244. Do you draw any distinction between those trained at the Staff College and those not trained at the Staff College?—I do not think for a Brigade-Major of an infantry brigade it makes a great deal of difference. Perhaps they are better adapted for preparing reports, because they have had more practice than others; but I do not think otherwise as regards the other details of the Brigade duties it makes much difference.

16245. There is one other point that you mention, that company officers should be relieved of pay responsibilities?—I think they certainly ought to be relieved of pay responsibilities. I think far greater responsibilities have been thrown upon them of late years than they formerly had. When I joined the Army we had the regimental paymaster, and although the captain of the company paid his men, still he always had the paymaster, who had his regular office, to whom he could always go in any difficulties, or to get advice and get assisted in his accounts. Now the regimental paymaster no longer exists, and his accounts are sent away to somebody else to audit, and he has not got a ready means of referring any questions; and also the accounts of the soldiers are very intricate; they are being lightened now, but they were very intricate, and the consequence is that even with the greatest care officers very often lose large sums of money, although they are thoroughly careful and conscientious in doing their best.

16246. (*Sir John Jackson.*) And their training does not particularly fit them for accountant work?—No, very often a second-lieutenant with only a few months' service may have to take charge of a company of 100 men, and the whole of the responsibility is thrown upon him.

16247. (*Chairman.*) Do you attach importance to the men being actually paid by the officer?—I do not attach any importance to that. I would not have them paid by non-commissioned officers, because I think that is putting too much responsibility upon the non-commissioned officers. They would have to keep large sums of money which they have not the means of keeping or the opportunity of keeping.

16248. But you see no objection to their being paid by the paymaster?—Not the least.

16249. And that is the system that you would prefer?—Yes, I would prefer that much. The soldier would always be able to go to his captain if he had any complaint with regard to his pay accounts.

16250. (*Sir Frederick Darley.*) The books that the captain has to keep are very large and intricate, are they not?—Not the books he himself has to keep, the accounts are intricate.

16251. But they are in the books?—Books have been done away with to a very great extent, and large forms introduced instead of books. I doubt if it is an improvement myself.

16252. I have been in a barrack not long ago this year, and I saw those large books in force?—Yes, there are a number of books.

16253. A book of about that length (*describing*), an immense thing?—The pay accounts are all done on sheets now; they may be bound into a book in barracks for convenience, but in the field they would be carried merely one sheet for each month.

16254. There are all sorts of accounts to be kept, are there not—clothing?—Yes, clothing accounts and accoutrement accounts.

16255. Clothing issued and clothing returned?—Yes. The clothing accounts and the accoutrement accounts I think the captain ought to keep, because the efficiency of his company, his command, depends very much on all that, and he is responsible for all his accoutrements, and therefore I think he must keep the accounts of it himself. But I think it is very different in the matter of pay, because there are great responsibilities, and young officers especially very often lose a considerable amount of money, not through any carelessness. If men go away, if they leave on active service, you cannot tell how their accounts stand.

Major-General G. Barton, C.B., C.M.G.

20 Feb. 1903.

Major-General G. Barton, C.B., C.M.G.

20 Feb. 1903.

A man may be killed or a man may be sent away as an invalid, and men may desert, and perhaps some months after they have gone away you may get a charge sent to you, saying that about three or four months or six months ago it may be (perhaps six months is rather an outside limit) a certain man received more pay than he should have done.

16256. And you have to account for that?—You have to account for that; you cannot recover it from the man, because he has gone; he has been killed or invalided, and there is no means of getting hold of him, or he may have been discharged from the Army. There are various ways of losing money which really are not the fault of the individual, perhaps, who has to make it good. In a large battalion of a thousand men, where you have a paymaster in the battalion, or in a regiment of cavalry, your accounts go to him, and it does not take very long to look them over; the audit and examination is much more rapidly done than when it is done by a staff paymaster, who has a very large number of corps to do.

16257. (*Lord Strathcona and Mount Royal*.) Altogether, do you consider that officers in command and regimental officers generally are too much tied down by hard-and-fast rules imposed upon them by the staff as it is at present constituted?—In the training of their men I think that is so. I think the rules are too hard-and-fast for the training of the men.

16258. They have not sufficient discretion?—If I may give an example, I was in command of a very young battalion which had just come home from India and was being heavily recruited; all our older soldiers were discharged, and we had nothing but recruits; we had about 800 men nearly all recruits, and we got the new Lee-Metford rifle. I was obliged to carry out my practice that year of rifle shooting with the Martini-Henry rifle, which we got from the Ordnance store for the purpose simply to do our shooting, and then return it again. I consider that was absolute waste of time, but it was in the Regulations that every man must shoot so many rounds, and therefore we shot them. The reason we had to take the old rifle was that the new rifle, being a more dangerous weapon, required a longer range, and there were no ranges available for us. I would rather have had no shooting at all that year, or to shoot only 200 or 300 yards, instead of the longer distance, than to teach new men to shoot with the old rifle, which they would not use on service. That is what I mean by hard-and-fast regulations. I do not wish to condemn the supervision of the staff entirely, but there are occasions when we are rather too much tied down by hard-and-fast regulations. I think that very often the voice of the staff is stronger on those points than the voice of the Colonel of the regiment, who is responsible for the training of his men.

16259. And the staff would not be too exacting with regard to such matters if they knew more of regimental duties?—I think that they know; I do not wish to question their knowledge; but I think if they were more in touch with them they would not.

16260. (*Chairman*.) Then as to supplies, do you think there was mismanagement?—No, I would hardly say that; but I say that when we took the field, and were actually in the field, the number of Army Service Corps officers was extremely small. One hardly ever saw an Army Service Corps officer who had been trained in the duties, because the Army Service Corps is so very weak, and therefore nearly the whole of the work of the Army Service Corps was thrown upon anybody we could get. There were officers from the Yeomanry, Colonial corps, Infantry—they were got from everywhere, and as it is not a very attractive employment, naturally they were not always the best and the most energetic officers who cared to take up that sort of work, and also they were quite ignorant of it. When I say in my *précis* that there was mismanagement entailing enormous loss to the State, I mean especially in the storing of supplies during the later periods of the campaign. I personally found a very large amount of wasted stores, which, had they been in the custody of experienced officers, would have been turned over more rapidly, and would not have been damaged by the long storage and the climate, with the excessive rains that they have in that country. I would like to point to that merely to show that a very much larger staff of Army Service Corps officers is needed.

16261. Where you had the Army Service Corps officers the management was better?—Yes; they understood things, and they knew what to do.

16262. So that if there was mismanagement it only means that the officers were not up to the work?—They were called upon to do duties for which they had received no training.

16263. And you think there was loss in consequence?—I think undoubtedly there was loss when all the stores were at the depôts. There were an enormous number of depôts; there were depôts at almost every railway station in the whole of the Orange Free State, the Transvaal and Natal, and part of Cape Colony too. There were stores kept at every railway station, which means a very large matter all put together in what is lost from not turning the things over, from things being left, and issuing from new supplies instead of turning them over. You will quite understand that there may be great waste in that way, and I think there was loss that might have been avoided.

16264. I see you mention the butchering in particular?—With reference to that I am not sufficiently up in the particulars of it, but I know that there was some sort of contract by which the chief contractors, who I think were the Cold Storage Company, received 2d. a lb. for every ox that was eaten, even if we captured the oxen from the Boers.

16265. We have had evidence about contracts?—I think a great deal of that could have been done by the corps. When I was at Chieveley waiting after the battle of Colenso I was informed one day by a Staff Officer that my men were to have nothing but tinned meat, and I protested most strongly against it, because it was lowering the men's condition; it is stuff which makes them extremely thirsty, and our water supply was abominably bad there. I protested very strongly against it, and I daresay I made myself very unpopular in consequence, but I believe the real difficulty was the butchering, and I offered to do it myself. I had lots of butchers in my brigade, and I was able to do it.

16266. (*Sir George Taubman-Goldie*.) Was there plenty of live stock there?—The country abounds in flocks and herds.

16267. At that particular moment?—I think there is no doubt about it. There was the whole of Natal to draw upon at that time; we were not run out of stock.

16268. (*Sir John Jackson*.) I suppose your cattle were captured from the Boers, and the contractor had to do the butchering?—I am not aware that he did. I will not be sure about this, but my impression is that there was a butchering account kept, and that if I captured oxen from the Boers, and my own men butchered them, the contractor who followed my camp credited that account with 2d. a lb., but I will not say that is so for certain. That was the general impression, at any rate, and I believe that was the case.

(*Sir John Jackson*.) Possibly the contractor might have considered in fixing his price the advantage he would get by those captures of cattle.

16269. (*Lord Strathcona and Mount Royal*.) Were you often confined to the use of tinned meat when it would have been quite possible and easy to get fresh meat?—No, not at all. It was only on that occasion that I was told I was to have tinned meat every day, no more fresh meat, and I protested and objected, and it was altered.

16270. But when it was at all practicable to have the fresh meat it was supplied?—Yes, we always had it; we did not have any excess of tinned meat at all. Throughout the whole of my experience in South Africa wherever I was during the whole time, nearly three years, I was out there, we never had any excessive quantity of tinned meat at any time.

16271. (*Chairman*.) The quality of the supplies was good, was it?—The quality of the supplies was excellent.

16272. All round?—All round, and sufficient, except that I think we ought to have had a little more tea, and we generally got it, but it was not a recognised thing.

16273. (*Sir Henry Norman*.) Did you have bread or biscuit?—We had bread and biscuit, but we were not often confined to biscuit unless we were actually on some long marches; there was a great deal done in the way of baking. I do not think they could probably have done more than was done in baking; bakeries were established in every conceivable place, and very quickly in my experience we were supplied. Even later in the campaign all our blockhouses were supplied all through with bread. Of course, some of the marching columns could not get bread, or they would start away with bread for three or four days, and when it was finished they had to come to biscuit.

16274. (*Lord Stratheona and Mount Royal.*) And the biscuit was of good quality—equal to good ship biscuit that is usually on board ship?—Yes, I think the biscuit was quite good.

16275. (*Chairman.*) Do you wish to say anything about horses?—I have nothing specially to say about horses.

16276. They would have done better if they had had a better chance, I suppose?—I think if they had had a better chance they would. The imported horse must be rested before he is worked; that is practically what it amounts to. Of course, I think at first we might have got more horses in the country, but there may have been political reasons for preventing a general surrender of horses—in Natal, for instance.

16277. As regards railway management, you think that there was some fault there?—I think so far as railway management is concerned that they were rather unfortunate in some of the officials; a good many of the officials appeared to assume a rather hostile attitude.

16278. (*Sir Frederick Darley.*) In Natal or the Orange Free State?—The Orange Free State and the Transvaal.

16279. (*Chairman.*) In the Free State and the Transvaal the railways were really military railways, were they not?—They were military railways, but a great many of the officials were Hollanders, Dutch certainly.

16280. That railway was completely in the control of the military authorities, was it not?—Yes, it was, but I think there were a great many complaints of insolence on the part of railway employees, for instance, to military officers, which rather impeded the work.

16281. But there is no reason why those should not have been dealt with if it was a military railway?—I can give an instance of a very serious railway accident that occurred near Pretoria when a train was ordered to stop outside about three miles to pick up some men at a camp. The military officer at the railway station at Pretoria told the station master that the train was required to stop there and gave it him in writing. There was another train that followed it at an interval of 15 minutes, or something of that sort, and the intention was to warn the guard and driver of the second train that this first train would have to stop at the place, which was not exactly a station, but a siding, which had been occupied for many months. But the station-master did not do it; he declined to do it. I ought not to say he declined; he accepted the order; but he did not do it. I never heard the result of it; but, as a matter of fact, I know his answer was that it was not in accordance with the regulations of the Transvaal Railway that the train should stop at a siding, and we had nine men killed in consequence.

16282. (*Lord Stratheona and Mount Royal.*) Had they not an experienced dispatch officer constantly at the telegraph on the railway to give intimation of trains?—Yes, there was all that. I do not say that the traffic management was not all right in that respect, but I mean to say that there was a certain amount of friction between the railway officials and the military authorities; and although I do not make a serious point of it, I do not think the same sort of thing would have happened in Germany. I do not think a station-master in Germany would say to the general officer who was the military officer in charge of the station that he would decline to carry out his orders on a military railway.

16283. (*Chairman.*) But you do not know what happened?—As a matter of fact I think this man was removed from his place, but I do not think that was sufficient.

16284. (*Sir Frederick Darley.*) And deaths ensued from that accident?—Deaths ensued. The whole thing was examined and inquired into by Lord Kitchener, and the man was removed from his appointment, I believe. But I give that as an instance; there were plenty of other instances.

16285. (*Chairman.*) In Natal you had ox transport?—We had ox transport in Natal, regimental ox transport, besides Army Service Corps convoys.

16286. And regimental transport is what you prefer?—I prefer the regimental transport because I believe that the supervision is much superior. It is better supervised by the regimental authorities; they are more interested in it personally; their whole comfort and everything depends on it. They have the same animals and the same drivers, and attach themselves to corps and get to be known, and undoubtedly wherever that can be done I think that is a very great

advantage. It may be somewhat wasteful, but I do not think it really is so—I mean in this respect, that if a corps is going to stop and not march at all for a month or so, of course it is better that that transport should be utilised for some other purposes, otherwise it would be lying entirely idle. But wherever it could be arranged I would invariably have transport attached permanently to a corps in the field.

16287. What do you mean when you say in your précis that the infantry are shabbily treated in load tables?—It is run very much too fine as a general rule so far as the infantry are concerned, and they suffer chiefly because there is nothing that they use up. In the cavalry there is always a certain allowance for forage, and when a cavalry corps is moving, if they start with very heavily-laden wagons the first day, the first day's consumption of forage gives them space and brings down their weights, and consequently they are able to carry many more things which are really more essential in the field than infantry are able to do. When I used the word "shabbily" I did not intend this to be actually accepted as evidence.

16288. (*Sir George Taubman-Goldie.*) To what extent would you advise the allowance being increased; have you thought of that?—I have not gone into that fully. I think we generally noticed that. I think those in the infantry generally noticed it.

16289. Would you give them 10 per cent. more?—I would certainly give them a rather more liberal supply—something a little better. The infantry have to walk, and the others are carried, and considering the condition that we were in and the whole Army was in at that time (at the time we were marching hard), there was nothing for the infantry at all.

16290. The entrenching tools were carried for them, I suppose, separately?—Entrenching tools were carried, except the Wallace spade, which was carried by the men.

16291. Do you approve of that?—No, I do not approve of that at all. I think it is weighting the men too much, and I think the Wallace spade is actually no use.

16292. What would you substitute for it?—I would have the tools carried.

16293. Proper tools?—Proper, good, substituted tools, and for certain occasions I would have it arranged so that the man can strap a pickaxe or shovel on to his back. But that would be only for special occasions; one does not want to be digging every day.

16294. (*Sir John Jackson.*) You would substitute another spade for the Wallace spade?—I would not have the entrenching tool carried by the soldier.

16295. You said you did not approve of the Wallace spade; is that a question of the design of the spade?—I think it is a poor thing; it is weak, and not suited for the purpose, and it is at the same time a considerable encumbrance to the soldier.

16296. But, apart from its being an encumbrance, you think it is an unsuitable tool?—Yes, I think it is an unsuitable tool for its purpose.

16297. What would you suggest?—I would suggest that a certain number of first-rate entrenching tools of the very best material should be carried with each infantry corps, so that they can be attached to the person on occasions, but not carried permanently by the men. I think it encumbers the soldier too much.

16298. (*Chairman.*) Then as to medical arrangements, were you satisfied on the whole?—All the medical arrangements were very good that I had experience of, with one exception, and that was that when my brigade was transferred from Natal to Cape Colony; my field hospital and my bearer company were taken away from me.

16299. Were you supplied with another?—I was not supplied with another until some time afterwards, when I got to Kimberley, and it was then a very makeshift one, but I had already been in the field six months. My medical officers and the employees of the hospital were well known to my brigade and known to me, and they were all in touch and sympathy with one another, and it was a very great disadvantage to be deprived of their service. In the same way with my bearer company, they were part of my brigade organisation; according to the Army scheme they were just as much part of my brigade as one of my own battalions.

Major-General G. Barton,
C.B., C.M.G.

20 Feb. 1903.

Major-General G. Barton, C.B., C.M.G.
20 Feb. 1903.

16300. Then why were they removed?—That I cannot say. I strenuously opposed it. There may have been good reasons for it.

16301. But they were removed by order of the Commander-in-Chief in Natal, I suppose?—I presume so.

16302. (Lord Strathcona and Mount Royal.) Was it a question of economy?—I should not think so, but I do not know.

16303. (Chairman.) They were probably wanted in Natal, but you think that your claim to them ought to have had precedence?—Distinctly; I think it is a part of the organisation. Part of the organisation of an Infantry Brigade is to have a certain medical unit attached to it, and therefore I think that as far as possible that arrangement should not be disturbed. The bearer company was afterwards sent after me, because I complained again when I got into Cape Colony.

16304. What is your opinion about the Royal Engineers?—The Royal Engineers were very good throughout the campaign.

16305. I see in your Précis that you raise some question about the duties of the Quartermaster-General and the Chief Engineer?—Yes, I do, because the Quartermaster-General has disappeared, and I think it is a great pity that he should have done so. I think the Quartermaster-General is a most important person.

16306. Would you explain why you think so?—I think the duties of Quartermaster-General are the most important duties on active service. They have been partly taken over by the Adjutant-General, partly by the Supply Officer, partly by the Transport Officer, and partly and perhaps chiefly, by the Chief Engineer; and I think that the Quartermaster-General should certainly be restored to the Army both at the head of the Army and in all the Divisions; and I think it is being done.

16307. Did you find a disadvantage during the campaign from that cause?—I think so. I think it was a disadvantage in regard to many points that one wished to refer.

16308. As to guns, you are doubtful whether the very heavy guns are really needed in the field?—Yes. Finding that the Boers had guns so very much better than we had, of course we got up those very heavy guns from the fleet, but I think it is a question whether such very large guns are really wanted in the field, except perhaps one or two that could be kept back, but not for constant use—not invariably trying to get these very heavy guns forward into action.

16309. (Sir George Taubman-Goldie.) It is a question of mobility versus range, is it not?—Yes.

16310. And you do not think the long range is absolutely essential?—I will not say the long range is not essential, but they go in for more than that. These guns are an enormous weight; they are not mobile enough.

16311. Then it comes to that in the long run; when you get two guns, both of the best construction, one of a longer range than the other, it must be a question of mobility versus range?—Yes.

16312. And on the whole you are in favour of mobility?—I am in favour of mobility.

16313. (Chairman.) I think you prefer common shell to shrapnel?—I think we ought to have some common shell, certainly. It would have far greater destructive power and moral effect than shrapnel. We have entirely given up common shell in the field. That is perhaps an artillery question rather than for me, but from my own experience of seeing shrapnel I know that one cannot see the effect of shrapnel. Even the best trained artillery officer with the best glasses cannot see the effect of shrapnel at 5,000 yards; unless one happens to kill a man, who jumps up into the air and shows himself, it is exceedingly difficult to tell the effect of shrapnel.

16314. Can you tell the effect of common shell?—I cannot say that you can tell the effect of common shell, because we did not have any common shell, but you can tell where a shell strikes and breaks.

16315. (Sir Henry Norman.) When was it abolished?—I could not say exactly, but it has been abolished.

16316. Do you know why it was abolished?—I think it was abolished in consequence of trials that were made, and those trials I do not think are a fair test, because a great deal of shrapnel is harmless—it falls quite harmless. I am not quite certain, but I think that the trials were probably made at canvas targets, or something of

that sort, and then when shrapnel was fired it was aimed, under the best possible circumstances, no doubt, on those canvas targets, and there were a certain number of blotches and marks showing that they had been struck, and every one of those marks was reckoned as a serious injury. And that is not always the case. A great deal of the shrapnel, I consider, falls quite harmlessly. We have often had shrapnel burst right over us and not injure anybody in the least.

16317. (Sir Frederick Darley.) If you were firing at guns, for instance, to try to dismount them?—We could not do that with shrapnel, it would do no damage.

16318. But if you were firing with common shell?—I think with common shell it would most certainly do damage, and I think the moral effect is greater.

16319. (Chairman.) But was there no shell used to dismount guns in the war?—I have no doubt that our 6in. guns fired shells. I could not say for certain, but I should think that they did.

16320. But not the field guns?—Not the field guns; they carried nothing at all except shrapnel. I think, as a matter of fact, the field artillery carry one or two shell as range finders, but I am not even certain of that. I think they do, because it is so difficult to ascertain the range by shrapnel. Shrapnel goes into the air; we fire at a ridge, and we see the shrapnel burst in the air, but we cannot say exactly at what point it has burst, whether it has burst 300 or 400 yards in front of the ridge or 500 yards beyond it; we simply see it burst in the air. Therefore I think the field artillery carry a few common shell as range testers.

16321. (Sir George Taubman-Goldie.) But you may put a gun out of action with shrapnel by killing the gunners and horses when you are firing at a field battery against you?—Yes, we can do that.

16322. (Sir Frederick Darley.) We have heard that during the siege of Ladysmith none of the enemy's guns were dismounted. May that be accounted for by the use of shrapnel only, and not common shell?—Yes, I think possibly so. Then, of course, the Boer guns at Ladysmith—the investing guns at Ladysmith—were only fired at by our naval guns, the 4·7 and 6in. guns, but I think that they must have had shell, because they would naturally have brought up what they fire on board ship. They had shrapnel too, but they would have shell, and therefore I presume that it was simply that they did not happen to hit the guns, but I do not know why they should not have struck the guns.

16323. (Sir Henry Norman.) It has been given in evidence before us that the Boer guns kept themselves out of range, that they had a longer range?—Yes; I do not suppose they could possibly have hit the Boer guns on Isimbulwhana from Ladysmith.

16324. (Lord Strathcona and Mount Royal.) Has it been customary in former wars to use common shell more generally than was done in South Africa?—It was always used until it was done away with some five or six years ago.

16325. What was the reason given for doing away with it?—I cannot say, but I believe it was in consequence of some tests of the comparative value of common shell and shrapnel. The trials were well conducted, and extended over a long time. The matter was thoroughly thought out, but I think the artillery claimed for themselves more destructive power for the shrapnel than it really has, in consequence of, as I say, the target being marred and marked.

16326. You hold the opinion strongly that common shell should not be discarded?—Yes, I hold the opinion that we should have common shell.

16327. (Chairman.) The rifle, you think, is a good one?—I think the rifle is very good. I prefer the pull-off of the Boer rifle—the Mauser—because I think it is a better pull-off. Ours is more in the nature of a hair trigger and a stiff pull, whereas the Boer trigger—the Mauser—gives to the finger gradually until the rifle is discharged.

16328. But you have some criticism as to the sighting of the rifle?—I know from experience that the sighting might be improved, or else the ammunition is uncertain. I cannot say for certain which of the two it is.

16329. But for some reason or another it was not quite satisfactory?—I do not say that merely in regard to the war; I mean that that is our experience.

16330. (Lord Strathcona and Mount Royal.) They are

Major-General G. Barton.
C.B., C.M.G.

20 Feb. 1903.

not uniform then in sighting?—Each rifle should be carefully sighted of course and tested.

16331. (*Chairman.*) Your chief criticism of the organisation of the Army is as regards the present system of mounted infantry?—I think that one of the chief lessons of the war is that the infantry would find it extremely difficult to do, as they have always hitherto done, their out scouting and flanking, and that the assistance of a few mounted men is of enormous importance to an infantry force acting by itself. The tremendous range of the rifle at present, which goes up to something like 3,000 yards, renders it very difficult to have flankers out, or scouts in front of an infantry force sufficiently far to enable them to be reinforced or to get back, and at the same time to protect the column. The object of those scouts and flankers is that the main body shall march in security, and that the skirmishers or the extended files, shall give due notice in good time to enable a deployment; either they are to fall back or to be reinforced for fighting purposes. Therefore, I think, the provision of a few mounted men to each infantry corps would be an enormous advantage.

16332. You mean a detachment of mounted men to be kept with the battalion, but not to be used as a separate organisation?—Not to be used as a separate organisation, or to interfere with the eight company organisation.

16333. At present the mounted infantry company has been taken away, has it not, from the battalion, and used with other mounted infantry companies?—Yes, with other mounted infantry companies.

16334. That is not what you mean. You mean to have them always attached to the battalion to act in this way as scouts?—Yes, and that they should be trained with the battalion and trained with the brigade; the mounted infantry of the different battalions would be massed together to train with the brigade. I think it would give an opportunity of passing a very large number of men in each battalion through the mounted infantry course of training, and no man would remain simply as a mounted infantry man. He would go to the course of training, and might remain in it one month, two months, or six weeks, at the discretion of the commanding officer, until he became a handy, useful man. The riding does not take much training; it is not the dashing that is wanted so much, as to accustom the man just to ride on his horse, and look after his horse, and enable him to be carried rapidly across a certain amount of country.

16335. I did not quite gather that from your précis; I thought you meant to keep this mounted infantry as a separate organisation, a separate battalion. You mean, I now understand, to use it as part of your battalion, and pass men through it?—Yes, I say, "This establishment to be under the commanding officer, and be used for training as many suitable men as possible." You would then have in every battalion a very large number of men trained for these duties, and looking after horses.

16336. Why should it follow from that that all other mounted infantry is to be abolished?—Only in this respect, that it would be the mounted infantry. That is what I consider to be the best way of training mounted infantry, whereas now certain men are taken away from the battalion and sent to some central training ground where they are trained. They can in a battalion perhaps only have an opportunity of training, say, 25 men in a whole year, or in two or three years, or three or four years, whereas if 25 horses were given to a battalion, the men would go on being constantly trained in this work.

16337. I was thinking more of what would happen on service. If on service the general wanted a force of mounted infantry apart from your brigade I rather imagine you would object to the mounted infantry being taken away from the separate brigades?—I should not, of course, object for the general purposes of a campaign, and there would be, according to my idea and plan, a very large number of men in every battalion ready trained. If the general wanted them in the field on any occasion he would always find in every battalion a very large number of men trained, whereas he does not find that now. He can generally get them, but it does not necessarily follow that he will find them now; and if it is necessary to give up a certain number of infantry soldiers and make them into mounted infantry it can be done, but I know that during the South African War it was considered rather a hardship on

commanding officers that they should have to send away all their best men to the mounted infantry, to be utilised away from the battalion.

16338. (*Sir George Taubman-Goldie.*) Just at the time when they wanted them most?—We had to choose our very best men, and it was very hard on the non-commissioned officers; they had considerable losses, and we were constantly having to replenish the mounted infantry of 100 men. The orders were that we must keep it up to the full strength of non-commissioned officers and men. The proportion of non-commissioned officers for the mounted infantry was to be two or three times that of the infantry; therefore we had to take away from the battalion a very large proportion of non-commissioned officers for the 100 mounted infantry, and any casualties to the mounted infantry had to be at once supplied by our best men from the infantry regiment. That is weakening to the battalion, and, of course, if it can be avoided it should be.

16339. (*Chairman.*) Where any non-commissioned officer is taken away for other service you think his place ought to be filled?—If a non-commissioned officer is taken away for any employment outside his own battalion I consider his place ought to be filled at once by the commanding officer. That is merely a question of money. The only thing that militates against it is the question of the increased pay of the non-commissioned officer. But, again, the efficiency suffers very much; if we suddenly lose one of our non-commissioned officers we must lose in efficiency, we lose in superintendence and handling of men in the field, and even in their ordinary duties in camp, and so forth.

16340. And that happened during the war, especially on the line of communications?—I think it happened very frequently; we had to send away a great many non-commissioned officers for various duties, and we were not always allowed to replace them.

16341. You sum it up: "Every officer and man should fill one place only in the organisation of the Army"?—That is another point altogether.

16342. What is that point then?—That comes under another head altogether. That comes under the head "all anomalies, such as the Militia Reserve, should be abolished."

16343. Please state what it means?—What I mean about that is that the Militia Reserve were men who belonged to a Militia battalion, but who had put their names down for the Militia Reserve, which means that their services are available for the Line, and, therefore, when they were called out, as they were during the war, they were called out to join their Line battalion; and then afterwards, when the Militia battalion was called out the whole of those men were away, more than half the battalion was away; therefore, the Militia battalions, instead of coming into the field 800 strong, came into the field 400 strong, or less. I think the point is thoroughly understood now at the War Office.

16344. I think we have had other evidence about that?—What I mean is that a man should have only one place; there cannot be two calls upon him. If he belongs to a Militia battalion he cannot belong to a Militia battalion and also to a Line battalion at the same time. That is the present state; at least that was the state of the Militia Reserve unless it has been altered recently: The "Militia Reserve" being really, I should say, a misnomer, because it was really the Army Reserve. When called up as a Reservist the man joins the Line, he does not join the Militia, but he has had his training in the Militia.

16345. (*Sir Frederick Darley.*) What do you mean by this statement in your précis: "There was an enormous and unnecessary waste of men on the line of communications, and the practice of grabbing individual men and entire drafts was freely indulged in"?—That was so, I am afraid.

16346. (*Sir Henry Norman.*) I suppose that was owing to the immense demand for men on the line of communications?—No, it was not the demand, it was a draft going to join a battalion landed at Cape Town, and was on its way up country to join its battalion, when it was seized by somebody, and did not join its battalion perhaps for six months.

16347. Were they allowed to do that?—That I cannot say.

16348. (*Sir Frederick Darley.*) Although they were sent to join that battalion?—Yes. Of course, a thing of

Major-
General G.
Barton,
C.B., C.M.G.

20 Feb. 1903.

that sort may happen occasionally. If there is a critical moment, and some particular post has to be defended, it would probably be necessary to stop a train and utilise the men that happened to be passing through, but when that danger is passed those men who have been temporarily detained for a special purpose should be sent on at once. I think everybody knows pretty well that the practice was indulged in, and that it was a mistake, and the lesson from it simply is that it is better to give up a certain portion of a force to protect the lines of communication than to trust to generals who are in charge of certain sections just taking what men happen to be available, and making the most of them. There were numbers of drafts that arrived in South Africa which never joined their regiments for six months, and more than six months many of them. Many of those men were very young soldiers, recruits, and perhaps they came out with a second lieutenant, a young sub-lieutenant. It is not good for them; they were not of the same value; 100 men coming out in a draft like that would not be of the same value as a complete company of infantry detached under its own officers for that particular duty on the line of communications. That is the point that I wanted to make.

16349. (*Chairman.*) You want to encourage infantry officers to keep horses?—I would encourage infantry officers to keep horses, certainly. I think it would be very good for their training that they should be accustomed to ride about the country. It makes them very much more observant, and I know that a very large proportion of infantry officers in the Army would keep horses if it was not for the very great expense and difficulty of a stable. If you hire a stable outside the barracks it adds very much to the expense, and also the commanding officer will not allow a man to go out to groom his horse; therefore it means a civilian groom always, and the expense of the stable, and that is prohibitive. I think that it improves the mind of an officer who is accustomed to hunt and ride across country, and to ride about generally, and constantly, whenever he has leisure.

16350. That means stabling provided by the State?—Yes.

16351. (*Viscount Esher.*) I suppose it would not mean a very big stable?—It would not mean much, about 12 to 15 stalls perhaps to an infantry battalion. In the expense of building a large barrack I think it would be something very small.

16352. Do you propose that an officer should be allowed to have a soldier groom?—I put it at the discretion of the commanding officer. I think that the groom, as it is arranged regimentally, would not suffer in any way from his military training. I should certainly make him perform a certain portion of his duties so as not to make it heavier on the other men, and he would have his complete training.

16353. (*Lord Strathcona and Mount Royal.*) Then he would have a groom besides his ordinary servant?—I do not say that I would give every officer a groom.

16354. But every officer having a horse?—I would not even say that; probably one man could perfectly well groom two horses. I would merely have it recognised in some way in the regulations that there should be nothing against it at any rate.

16355. (*Chairman.*) And you want to encourage rifle shooting. Is there any particular method you want to do that by?—Of course, as to rifle shooting and instruction, it is rather a difficult point. A man may not be a first-class shot, and a very great majority in the Army are probably what are called second-class shots, but that means a very good shot all the same; and there are very often in many places penalties for not being a better shot than you are, which rather make men kick against it, and make them surly and ill-tempered about the rifle shooting, and one wants as much as possible to do away with it.

16356. You must have some incentive to the man who is lazy?—Yes.

16357. And you would not publish the musketry figures?—I would not publish the musketry figures, because I do not think there is any very great advantage in it.

16358. You mean the figure of merit for the regiment?—Yes.

16359. Because really now it is more a question of individual shooting?—Yes, I think there is no question about it that where you have a published figure, it has led to deceit, misrepresentation of facts, and as long

as the general knows what the figure is, if he does not think it is good enough he can express his opinion upon it. I do not think that a mere comparison of the figures of the regiments in the Army can be made, as they are shot under such very different circumstances that it is not really a fair test or criterion.

16360. (*Sir Frederick Darley.*) And the conditions as to climate and atmosphere are also different?—Yes, it is not a fair test; all are not shooting under the same conditions. If all were shooting under the same conditions it would be a different thing. I would not publish those figures, but at the same time each General Officer in his own district, where the conditions are probably about equal, can judge of them; he can judge where one does well, and where another does not do well.

16361. (*Chairman.*) The pouches that the men have for carrying their ammunition you think need improvement?—I think they need very much improvement.

16362. Did you find that there was great loss of ammunition from them?—The present pouch, the buff pouch, is an extremely stiff, uncomfortable and awkward thing. Personally I am in favour of the bandolier. Besides we can barely squeeze 100 rounds into pouches; the men are always required to carry 150, and some generals like to carry even more, and the consequence is that packets of ammunition are always carried either in the trousers pocket or the coat pocket, and if it is not used it gets knocked about in the pockets, and broken, and that leads to loss, and at the same time there is not very much check on a man. He can always excuse himself by saying it fell out of his coat pocket when he took it off.

16363. (*Viscount Esher.*) How many rounds does a bandolier carry?—I think a bandolier carries 100 rounds.

16364. (*Sir Frederick Darley.*) Would you carry it in clips as the Boers did in the bandolier, in clips of five?—No, I do not think so. I think our system is better, because it is not always necessary to use the magazine. I think it is of great importance to have the magazine full. The Boer puts his clip in, and then he has to use up his cartridges, whereas we do not use up the cartridges in our magazine. We fill our magazine, and then take one deliberate shot each time with a fresh cartridge; but we keep our magazine, and if we were suddenly attacked by cavalry we should have our magazine ready. The Boer has not got that; he puts in his clip, and he is then obliged to shoot away one, two, three, four, five cartridges, and then his rifle is empty, and if he is attacked hurriedly at that moment he has got nothing in his rifle. I think our rifle is better in that way.

16365. (*Lord Strathcona and Mount Royal.*) Do you consider that the present khaki uniform is in every way suitable for service in the field?—The khaki uniform that we used, do you mean?

16366. As used now?—Of course, there have been so very many alterations since we came home six months ago. I was surprised the day before yesterday, when I went to Aldershot. I saw a perfectly different khaki coat from what I had seen three months ago.

16367. What do you believe to be its advantage as compared with the former uniforms of different colours?—I think that the khaki is very good, but I would have the khaki of the very simplest description. I think it should be a fighting dress of the very simplest description. I think, so far as the officers are concerned, the present coat is rather elaborate, but I have not given the matter any very serious study, because I am on half pay at present, and therefore not thrown with them much, only I happen to have seen the new khaki coat the day before yesterday, and I found it quite different from what I saw three months ago.

16368. I believe one cause for its introduction was that it was not so easy to distinguish at a distance?—Yes, that is as regards the colour. That is so undoubtedly. I think a man in khaki lying among rocks is not so observable. But I think the chief point is to have the whole dress of the same colour, that is practically it. I believe if you had blue, if it was all of one colour, under many circumstances in Europe the blue would be just as unobservable.

16369. Blue would be quite as good?—Yes; where there are backgrounds of hedges, and so forth, I do not know whether khaki would be more invisible than all blue. I think the great thing is to have the coat and

trousers of the same colour. It is the contrast of colours that makes them observable.

16370. (*Chairman.*) As to raising local corps, I understand the point that you wish to make there is that there ought to be some code of instructions by which the raising of corps should be done on a regular system?—So that it should be done a little more rapidly. I speak from experience. I raised a corps myself during the Zulu War in South Africa. A great many corps were raised in South Africa. Probably one of the officers who raised corps could give much more valuable information on the subject, but that is what struck me, if we had a few simple rules for the guidance of the men specially enrolled in the Colonial Corps in small pamphlet form it would be very useful.

16371. Nothing of the kind exists that you know of?—I do not know that anything exists at present; therefore each officer has to do the best he can to frame rules, and there are some things to which you must tie a man when newly enrolled; you must give him some sort of instructions.

16372. And whilst speaking of local corps we might take another paragraph in your précis dealing with the same subject. You think that even in Colonial Corps the commanding officer and a portion of the officers should be Regular officers?—Certainly, that is my experience.

16373. But not the non-commissioned officers?—The non-commissioned officers I would have from the newly enrolled men. I would not have non-commissioned officers from the Regulars, because they are perhaps apt to be rather too regular in dealing with Colonials, but I think the Regular officer adapts himself at once to the habits and feelings, and so forth, of specially enlisted men of that sort much quicker and more readily than non-commissioned officers of the Regular force would. That does not apply to permanent Colonial Corps.

16374. No, of course not?—Because there, of course, the officers are accustomed to the men and the men are accustomed to the officers.

16375. (*Lord Strathcona and Mount Royal.*) And their training is very much on the lines of that of the Regular Army?—Yes, they adapt themselves to it, no doubt. But in the case of a specially enlisted corps, where everything starts from the beginning, then I think there should be a very large proportion of Regular officers.

16376. Take, for instance, the North-West Mounted Police of Canada, and any similar force; you would consider the officers of such corps quite suitable?—Quite, certainly.

16377. Where the training is very much the same as that of the Regular officers?—There is no better officer out there than Colonel Steele, of the North-West frontier.

16378. (*Sir Frederick Darley.*) In reference to the company officers whom you say should be relieved of pay responsibilities: Do the pay responsibilities and the clerical work they now have, in your opinion, interfere with them in the training of their men; does it take up so much of their time that they are not able to devote sufficient time to the training of their companies?—I can hardly say that it takes up too much time, but it is the anxiety, worry, and responsibility of it which may prevent an officer perhaps reading more and studying more, and thinking more of his profession if he has those things on his mind.

16379. Do you not think that the very first duty of a good company officer is the training of his men?—Yes.

16380. And that anything that interferes with the training of his men he ought not to be asked to do?—Yes, I think so. I have always been of that opinion. I have over and over again recommended on various occasions when the opportunity offered that the executive officers of companies and regiments should be relieved of pay responsibilities.

16381. Of course, the fact that he may be at a loss having these pay responsibilities to discharge, may press on his mind so much as to prevent his discharging his duty of training the men?—I quite think so.

16382. (*Sir John Jackson.*) I think it has been generally stated that our men were not so well able to take care of themselves as the Boers; in point of fact, that they were not sufficiently careful in taking cover. Is it your opinion that our men in attacking were better than the Boers; that they showed more pluck? The Boers, I think, comparatively, very rarely attacked?—I hardly ever saw the Boers attack, except when they could manage to surround us and fire from a long distance, but I never saw the Boers advance to the attack on a position at all similar to the positions they held themselves.

16383. Whereas our men you found showed splendid pluck?—They showed magnificent courage and pluck.

16384. Then you spoke of the railway management being faulty; in what particular way was the railway management faulty?—I used that word "faulty" because I did not know that this précis was going to be produced. What I meant to imply was that if a railway is going to be used in a campaign a very strict discipline needs to be maintained on the line, and that the officers in command of the line of communications shall have very much more responsibility in connection with the railway, and have their orders obeyed, than a few officers who are specially deputed as railway officers.

16385. Civilian officers do you mean?—No, military officers.

16386. I will put the question in this shape:—From your experience did you find that the civilian officials of the railways did not pay sufficient respect and attention to the military officers in command?—I consider that the general and other officers in charge of the line of communication should have their orders attended to by the railway officials.

16387. And that in the case of South Africa that was, as a rule, not so?—There was not sufficient discipline maintained on the line.

16388. Or attention given to instructions?—Or attention given to instructions which they might consider necessary from time to time. One was constantly having to alter things. At one time trains were allowed to run at night, and at another time they were not allowed to run, and so forth; and very often the officials would say, "We cannot carry out your orders unless you refer them to Johannesburg," and so on.

16389. (*Lord Strathcona and Mount Royal.*) May I go back for a moment to a little matter mentioned in the second paragraph of your précis, where you speak of the Wallace spade, which you say is useless and cumbersome. Is that the regulation spade, and the only one that is issued to the Army?—It is the only one that is carried by the soldier.

16390. It is issued?—It is carried always by the soldier every day; it is part of his equipment.

16391. And you look upon it as being utterly useless?—I look upon it as a useless encumbrance. It is a very awkward thing to carry and march with, and it is of very little use on the ground, except it is the very softest ground, that has been turned over before.

16392. It is nothing more than a toy spade?—I think so.

16393. How long has it been in use?—It has been in use, I think, about 15 or 20 years.

16394. And it is quite unserviceable?—There are a great many different opinions on the subject, of course. That is my opinion. I say it is too much of a toy; it is not good enough. It was no use in South Africa.

16395. That is your experience?—That is my experience. I have never liked it.

Major
General G.
Barton,
C.B., C.M.G.

20 Feb. 1903.

NOTE.—The witness desired to submit a statement in writing with regard to certain points in connection with his services in South Africa, and leave was given to him by the Commission to do so. *Vide Appendix, page 659, post.*

FORTIETH DAY.

Tuesday, 24th February 1903.

PRESENT :

The Right Hon. The Earl of ELGIN AND KINCARDINE, K.G., G.C.S.I., G.C.I.E. (*Chairman.*)

The Right Hon. The Viscount ESHER, K.C.B., K.C.V.O.
The Right Hon. The Lord STRATHCONA AND MOUNT
ROYAL, G.C.M.G.
The Right Hon. Sir GEORGE DASHWOOD TAUBMAN-
GOLDIE, K.C.M.G.

Admiral Sir EDMUND HOPKINS, G.C.B.
Sir JOHN DGE.
Sir JOHN JACKSON.

BERNARD H. HOLLAND, Esq., *Secretary.*

*Major-
General A.
H. Paget,
C.V.O.*

Major-General A. H. PAGET, C.V.O., called and examined.

16396. (*Chairman.*) You went out to South Africa when the Army Corps went ?—Yes.

16397. At that time you were in command of the 1st Scots Guards ?—Yes.

16398. And that formed part of Lord Methuen's Division ?—Yes.

16399. In the course of the fighting were you appointed to command a Brigade ?—Not in the first engagement ; in the first engagement I commanded two battalions told off for the attack at Belmont.

16400. Your own battalion and another ?—My own battalion and the Grenadiers.

16401. Was that your position during the fighting on Lord Methuen's advance ?—No ; in the next engagement two days after, I commanded my own battalion as a Divisional Battalion not attached to my Brigade ; at Modder River, two days after that, I commanded my own battalion, and when Lord Methuen was wounded the command of the Brigade of Guards devolved upon me.

16402. And at Magersfontein ?—At Magersfontein I was not present, as I was very ill.

16403. After that, in 1900, you were promoted to Major-General ?—On the 1st April, 1900.

16404. And you were in the Kimberley district ?—Yes, at first : my first command was the Kimberley district.

16405. And after that you joined Lord Methuen's Division ?—I did, and advanced with him ultimately to Kroonstad and Lindley, where the Yeomanry were surrounded by De Wet.

16406. On that occasion you made a very fine march, I think ?—The Infantry marched very well indeed, and the mounted troops made a very long march. I was not actually with Lord Methuen ; that is to say, I had my independent command ; he was on the left of a spruit that was there, and I was on the right ; he was on the north, and I was on the south ; we were moving parallel to one another, and he was in front of me. My force was chiefly infantry, and his nearly all mounted troops.

16407. And you remained at Lindley ?—I did, for a month. They left me to hold Lindley against the Boers, who at once surrounded the place.

16408. And did your troops behave well under those circumstances ?—Extremely well. We had some very severe fighting, and I could not wish troops to behave better than they did.

16409. Had you any difficulty about supplies on that occasion ?—Not much difficulty. De Wet always tried to take our convoys, and each time we got a convoy in it had to fight its way in, but it was not a difficult road, and it was easier than in most places to send out troops to hold posts of vantage where the convoy could be passed behind.

16410. Where had they to come from—from Kroonstad ?—From Kroonstad.

16411. And that was a distance of how far ?—About forty miles. The traction engines were employed—it was the first time I had seen them—for bringing me out supplies.

16412. What did you think of them ?—They did exceedingly well, but the difficulty was coal. As an example : when they came to Lindley the first time, they got there

with 50 or 60 tons of forage, but their coal had given out and there was no means of getting them back. They require to be used along a route where there are coal depots, otherwise they are practically useless ; to send them as they were sent to me at Lindley, and then back, there must be depots of coal, otherwise they cannot be employed.

16413. And to make them carry their own coal would lessen their utility ?—Very much, indeed. They burn a great deal of coal.

16414. What happened on that occasion ? Had you to get up coal in order to start them again ?—I pulled down some houses, and cut up all the wood in the houses, loading up all the wagons with wood, and they got back in that way.

16415. Burning wood ?—Yes ; I pulled down a lot of houses, and used the old timber.

16416. They can work with wood ?—Yes.

16417. (*Sir George Taubman-Goldie.*) Equally well with coal ?—No, the coal is much better, but they had no difficulty in getting back.

16418. Was it hard wood ?—Very good wood ; we picked the wood.

16419. (*Chairman.*) You were reinforced after a time ?—I was ; a large mixed mounted force was sent out to me.

16420. And did that disperse the Boers ?—Well, it did not disperse them, but I was then in a position to attack the Boers.

16421. To take the offensive ?—Yes, which I did at once, and after two days' fighting we drove the Boers back on Bethlehem.

16422. And took Bethlehem ?—Then we assaulted Bethlehem and took it.

16423. And there did your troops behave well again ?—Exceedingly well. The mounted troops were a very mixed lot. I had nine different units composing the 1,100 men who were sent to me, and they had never been together ; they had all been scraped together, you may say, and sent up to me.

16424. Were they Regulars or Irregulars ?—All Irregulars ; I had no Regulars.

16425. How did you arrange for the command of mixed lots of that kind ?—Every unit had its own leader, and they were all under one Brigadier, who had been appointed by higher authority—I am not aware by whom.

16426. That puts the men under a disadvantage, does it not ?—Considerable disadvantage.

16427. You would have been much stronger with perhaps a smaller force ?—Yes, and a more compact force. I think I should say that at that time I imagine the Commander-in-Chief was much pressed, as there was fighting going on everywhere, and they had to scrape together whatever men they could.

16428. Had you Volunteers with you at that time ?—Yes, I had a very good battery, the City Imperial Volunteers Battery, composed of the Honourable Artillery Company.

16429. They did well ?—Extremely well.

16430. How did they compare with the Regular Artillery ?—As far as guns were concerned they were a

good deal better, and as regards the men themselves, they were certainly quite as good. I should say that they must have had some expert gunners sent out amongst them, their shooting was so good.

16431. How do you mean that the guns were better?—They had a very superior gun; it out-ranged the other guns, was better sighted, and was a quick firer.

16432. (*Sir George Taubman-Goldie.*) Their guns were a present sent out?—No; I cannot tell you the history of the guns. You are thinking of the Elswick guns?

16433. Yes?—These were not the Elswick guns; these were the guns sent out with the Honourable Artillery Company, and I have no doubt they were given to them by the City. I know about the Elswick guns; they were given by Lady Meux to Lord Roberts, and I had two of them for a short time after the capture of Pretoria.

16434. They too were superior to our guns?—Very much superior; they were superior, again, to the guns of the City Imperial Volunteers Battery.

16435. (*Chairman.*) We have now got to a period after the capture of Pretoria?—Yes; there was great competition for these guns, and it was thought a great favour sometimes to have two of them.

16436. We are not inquiring into the military operations after the capture of Pretoria, but I just ask you this: after you joined General Hunter?—Well, General Hunter came up to Bethlehem, and I then formed part of his force—it would be very difficult to know what to call it, because it was practically a small Army Corps.

16437. Is there anything in the course of those operations in which you took part to which you would desire to call attention?—Of what nature?

16438. We desire to give any officer an opportunity of making any statement if he desires to do so, but we are just taking the statements as they stand; if there is any incident that occurred during your service in South Africa to which you wish to call our attention, now is the opportunity?—There was nothing which, in the public interest, I think it necessary to state.

16439. Passing on to the *précis* which you have been good enough to give us, as to shooting you were not very well satisfied?—Not at all satisfied; I thought the shooting was bad.

16440. Did you think it compared unfavourably with that of the Boers?—Very much so; some of the shooting of the Boers was extraordinary.

16441. Some of it, no doubt, but taking it on the average?—In those early fights their shooting was very accurate; every bullet had some mark, and there was no wild shooting at all, and when we got to the closer ranges, in places which were fire swept, everybody was hit.

16442. Do you think it was the case that in the earlier fights the Boers knew the ranges?—Yes, they must have known the ranges approximately.

16443. Which our men did not know?—That is so.

16444. And I suppose the Boers, not unnaturally, were better judges of distance than our men?—Much finer judges of distance, and then they were in their own climate, where they were accustomed to pick up ranges while that clear climate made it very difficult, whether for the officers or the men of our forces, to judge distances. No amount of practice in our own country would have made our men judges of distance in that climate. It was one of the difficulties of the war.

16445. We had some evidence which went to show that in the opinion of some officers the shooting of the British Army did not compare unfavourably with that of the Boers, taking it as a whole?—That must be a great deal a matter of opinion. I am going more not by what I saw when I had a higher command, but what I saw when I was in the fighting line myself.

16446. That is very valuable to us?—I was in the fighting line and saw everything that was going on, and certainly the Boers' shooting was very good indeed.

16447. And ours was not?—Our first move on Modder River I daresay is within your recollection, and there the whole of my advanced line and my machine gun section was wiped out in the first fire. The machine gun section had seven men and two mules, and in a few seconds there was nothing left.

16448. (*Sir John Edge.*) There the Boers knew they were going to be attacked?—Yes.

16449. And they had taken up their position some days beforehand?—Yes.

16450. It is quite possible that they may have marked off the ranges?—Quite probable.

16451. It was a proper military precaution?—Yes, but still it was 750 yards, and they had to shoot with great accuracy, because it was a long distance.

16452. Where you were fighting the Boers and driving them back to a position which they had not already taken up, did you find their shooting as good then?—No.

16453. To what do you attribute that—to their not having got the actual range?—No, the mere fact of retreating alone would be sufficient to account for their moderate shooting then, as beaten troops never shoot steadily.

16454. But would it not make a very great difference in shooting where the officers and men knew the range they were to fire at?—It would make a very great difference if they knew the range they were firing at, because as long as troops are steady and they have got the range with the accurate weapon of the present day, every bullet must come in very handy to its mark, the trajectory is so very flat. I would like to correct perhaps my remark when I said that the shooting was bad. I had better add to that that it was bad as regards moving objects. I have seen Boers missed, and I have had the same thing reported to me many times—Boers galloping up, say, to within the length of this room and the men missing them, and that can be accounted for by this, that in a great many cases with our hard-and-fast rules the men have all practically got their rifles with a fixed sight up to 500 yards, and it remains there practically all the time they are shooting. They forget in the excitement of men charging that they are shooting at these men with their sights fixed for a 500 yards' range, and the result is that all the bullets go over. The Boer has no such thing as a fixed sight—a slide which runs to the end of his back sight leaf.

16455. How does he know the proper elevation?—Because the Boer does not look at a moving object through the sight of his rifle. He fires high or low at the men according to the distance he guesses he is from them, and that is why our men were all rolled over at close quarters while we never hit the Boers.

16456. But shooting in that way requires a great deal of practice?—Yes, it would require a considerable amount of practice. I may add that given the range our men shot well enough; say that there was a range of hills at 1,200 yards, and they were given the accurate distance, all their bullets would go close up against the top of the hill. That they were very good at, but when I refer to bad shooting I mean at moving objects.

16457. (*Sir George Taubman-Goldie.*) Would you recommend a change of system in our musketry courses or merely an increase of the number of rounds in the year?—I should very strongly recommend an increase in the number of rounds in the year, but the present training is good, especially with the military rifle. We have now little movable cardboard men running backwards and forwards, and we have also the targets which rise and fall, giving two seconds for the men to get their sights on to them, and all that is very good training for the men.

16458. (*Sir John Edge.*) Do you think it would be possible to train the infantry now to make their eye the sight really, and not to fire with fixed sights?—Very difficult, almost impossible. A great deal of ammunition would be wasted, and I do not think anything would be gained.

16459. (*Chairman.*) These fights, of which you were speaking, were the earlier fights?—Yes.

16460. Do you think the men improved further on?—The men improved a great deal.

16461. You say they were careful of their ammunition?—Very.

16462. Does that mean that they abstained from firing?—Constantly when good targets were offered. It was the common knowledge practically of everybody who was amongst the men, and at Modder River more especially (I only refer myself to what I saw), I was lying down with some of the men, and we could hardly get them to fire. They said to me: "We do not see anything," and I said, "You may not see them, but they are all lying down on the river bank; you do not

Major-

24 Feb. 1903.

see them of course, but they are there." There was great difficulty at times to get them to fire.

16463. And that is because they were accustomed at home?—To reserve their ammunition, and to wait for some fixed target; that is their drill.

16464. There was a large amount of ammunition expended during the war?—Yes, no doubt. There was an enormous number of men engaged, and at one period all the troops were fighting every day in some form or another.

16465. I do not think I need take all these points separately, but marching, horsemanship, and general physique you consider to have been good?—Very good indeed.

16466. And the morale excellent?—Excellent.

16467. The horsemanship, however, was no good?—The horsemastership was not good, with the exception of the Regular cavalry and artillery.

16468. You are speaking with the experience of the Irregulars you have mentioned just now?—Yes, I should say that once or twice I had a brigade of Regulars attached to me, and I was able to compare notes as regards the appearance of the horses, and there was no comparison to be made.

16469. Even the cavalry soldier some witnesses thought was not a very good horsemaster?—He is the best.

16470. The artillery soldier we have always heard was good?—The artillery soldiers are wonderful horse-masters.

16471. But you think that the cavalry were too?—I think the cavalry were very good; the horses, when I saw them, always looked extremely well.

16472. And you think that, considering the class from which the Army is recruited the intelligence was good?—Yes, I thought it was very good considering the class.

16473. Does that mean that as the war went on they adapted themselves?—They adapted themselves, and improved immensely.

16474. And proved that they had it in them?—Yes.

16475. Do you think if you had had a superior class that experience of war would have been necessary to bring them to the same point as your soldiers came to afterwards?—It depends very much on the work they did at home before they went out; with soldiers who have to stand by hard and fast rules—what is called red tape, if I may use the expression—it takes a long time before they can be got to shake it off, that is to say to think and act for themselves, and that is the difficulty under which we laboured in the first part of the war.

16476. However intelligent they might have been before?—Yes, and there is also that fear of responsibility. The corporal will not do anything for fear of the sergeant, and the sergeant will not move for fear of the Captain, and so on, up to the senior officer in command.

16477. But granted you could train them on a proper system?—And take a larger minded view at home.

16478. In that case even the men you now have might be much improved?—Much improved.

16479. Does the same remark as to improvement apply to the officers?—As regards initiative, yes, and that dread of responsibility, which is what we all suffer from most, I think, should be done away with.

16480. That you found marked in the early stages?—Yes.

16481. But they grew out of it?—Not so much out of the dread of responsibility; in initiative and ability to think and act for themselves they improved enormously; but up to the last I think from reading the accounts alone of the actions that took place, if you read between the lines, it will be perfectly obvious that they dreaded responsibility.

16482. Have you any suggestions to make by which that difficulty could be overcome in the future?—It would present difficulties. I did touch upon it in the remarks I made. I think if we all in the Army felt that our actions would be fairly criticised, and not condemned too hastily, men would have taken more risks than they did. It was the dread of responsibility, of what might happen if things did not go well—that is what it amounts to in words—that hung pretty well over everybody. I do not refer necessarily to the higher

authorities; I am referring to the Colonels commanding regiments—perhaps the officers were afraid of taking the risk in case something went wrong, and they would be reported upon, and so on, right through. It is only a general feeling, not anything special, that I am drawing your attention to.

16483. But an officer ought to feel that his case would be fairly considered under all the circumstances?—If he has a check or a reverse he ought not to feel that that finishes him.

16484. (Sir John Edge.) Did you notice that there was any greater failure of taking responsibility as the war went on than there had been at the commencement?—Yes, it was very marked. Probably the reason was that there was a general impression that the war might come to an end at any moment, and consequently individual leaders often declined to take risks for fear of a reverse or a check just about the end of the war.

16485. Would it remove to any extent that tendency to avoid responsibility if an officer who met with a mishap had the right to have his case considered by a Board of senior officers in London?—Yes.

16486. (Chairman.) That means, as I understand it, that an officer ought to feel that before he loses his chance of further employment his whole career ought to be reviewed by some responsible tribunal?—Yes.

16487. And that tribunal you would prefer should be composed of several officers?—Yes.

16488. (Sir George Taubman-Goldie.) There is a general impression that the dread of taking responsibility is much more felt by Army officers than it is in the Navy?—Yes.

16489. Do you not think that the difficulty might be partly got over by giving greater latitude to subalterns and young officers in the Army?—Most certainly.

16490. In that way would they not grow up with a greater sense of individuality?—Certainly.

16491. So that when they came to have the command of battalions, or to be Generals of divisions, they would carry on the feelings that had been inculcated into them from their entrance into the Army?—Quite so.

16492. In fact the process of reform must begin from the bottom?—From the bottom, undoubtedly.

16493. (Chairman.) As far as the regimental officers were concerned, you cannot speak too highly of their leading of the troops?—That is so, and I saw a great deal of it. The regimental officer was a very fine fellow, and I think, if I may say so, his record as regards casualties—killed and wounded—in proportion to the men proves that.

16494. Were you satisfied with your staff?—Very much so.

16495. Did you have Staff College officers on your staff?—No, never.

16496. But you are of opinion that a proper training for a staff officer is an advantage?—Yes. The first thing is health and strength, because on service you must have men who are very fit.

16497. The work is severe?—The night work is very severe; after a long day's fighting you have to work all night making the arrangements for the next day, and it is a very common thing to be up all night after a fight.

16498. If equally good physically?—The trained man is the better man. When I began, my Brigade-Major had been Adjutant of a Militia battalion, and that was all the Staff I had.

16499. (Viscount Esher.) Was he a good staff officer?—He was a very hard working staff officer.

16500. And had he had a Staff College education?—No.

16501. (Chairman.) The next point upon which I wish to ask a question is with regard to horses; you say they were limited in number. What does that mean?—If we had a considerable loss of horses, and we came in wanting 100, 200, or 300, and we got half of what we wanted, we considered ourselves lucky. That is why I said they were limited in number, because the supply was not equal to the demand.

16502. You mean at the front?—Yes.

16503. That, I suppose, arose owing to difficulties in

supplying the casualties at the moment?—Yes, at the moment.

16504. You do not represent that there were not sufficient horses in the country, or perhaps you were not aware of that?—I do not think there were ever sufficient horses in the country. I may point out that I have only lately been sitting in this room on the Court of Inquiry on Remounts.

16505. You are aware, then, that the supplies were in excess of the demand?—Yes, they were so to speak, but the question is what was the demand? Their supply was according to the horses that were ordered, in excess, but the question is were enough horses ordered? The demand was, I suppose, what the Commander-in-Chief asked for in South Africa.

16506. And you think he did not ask for enough?—Well, I was under-horsed, and I never heard of any column which had all the men mounted.

16507. Was not that owing to the very excessive wastage?—Yes; but if there was excessive wastage the remedy was simply by having more horses. No doubt the wastage was caused by premature issue.

16508. That was the determining cause?—Yes. We would march probably at daybreak, come in in the afternoon, and pick up 200 or 300 horses, and go, say, 30 miles the next day.

16509. And to meet that would have meant the provision of sufficient depôts very much earlier in the campaign?—Yes, very much earlier; it would have saved thousands of horses.

16510. These depôts were instituted later in the campaign?—Yes.

16511. And when they were instituted did they, to some extent, meet the difficulty?—No; up to the very last we were short of horses.

16512. Then were the horses better acclimatised?—No, things remained practically in the same state up to the time I left, and that also appears to have been the case, from the reports I had, after I left, from various staff officers.

16513. There never had been really time?—No, there had never been really time to get 4,000 or 5,000 horses, and to keep on always having 4,000 or 5,000 horses in hand fit for issue. As soon as they were landed they were sent out. I will give you an instance that came under my notice. On a march in the direction of Philipsville I saw two mares drop premature foals in front of me, and I heard that there were nine cases on one march.

16514. Those mares ought never to have been sent up?—They had all been driven in from the neighbouring country, and they were just passed out to the troops 300 or 400 at a time.

16515. They were South African horses?—Yes, but nobody went into the question of their quality; they simply took a section of 400 horses and gave them to 400 men.

16516. They were not horses that had been imported from Europe?—No, these were local horses.

16517. I do not think I need ask you any question about supplies?—I had no trouble about supplies during the whole of the war; the food was excellent, and practically we were never short.

16518. And as to the rifle?—The rifle is a good rifle; the rifle with a clip is eminently preferable to the magazine.

16519. And the guns, as you said before, were inferior to those of the Boers?—Yes.

16520. You observe, as other witnesses have done, that you would have liked common shell?—Yes; I think I once or twice succeeded in taking positions with a very small loss of men, entirely owing to having common shell in my City Imperial Volunteers Battery. The principle of it is this: if the Boers are on the hills and ridges behind rocks, and shrapnel bursts, they all squat and get down behind the rocks. One does not know where they are, and cannot see them, but if a common shell is put amongst them they are jumping about all over the place, they show themselves at once, and then the infantry can locate them and one knows where to fire. The only effect of shrapnel on the Boers in my experience was to make them squat; I never could make them go, although I could keep down the fire.

16521. (*Sir George Taubman-Goldie.*) Are you speaking of common shells with time fuses or percussion fuses?—With percussion fuses.

16522. (*Sir John Hopkins.*) They did not give you common shell at all?—None at all. I never got one except with my City Imperial Volunteers Battery, and very effective they were. I could always move the Boers with common shell.

16523. (*Sir John Jackson.*) Where is the shrapnel supposed to come in?—On the plains, in the open, where there is no cover, but comparatively very few Boers were killed with shrapnel shell in the course of the war by my force.

16524. (*Sir George Taubman-Goldie.*) But it was a peculiar war?—Yes, very peculiar.

16525. And it does not follow that shrapnel would not be very useful in a European war?—No; I think in my remarks I said, "A small proportion of common shell." Let us take an attack on a village; what on earth use is shrapnel in an attack on a village? If it is necessary to knock down two or three walls before the men go in common shell must be used, and we have none. I afterwards had two naval guns, 12 pounders, and excellent guns they were; they had common shell, and they answered the purpose admirably. If you ask general officers who have seen much fighting they will tell you the same thing, that common shell is a very valuable thing.

16526. (*Chairman.*) You think that in training men all arms ought to be trained together?—Yes.

16527. Is that possible in this country?—Quite possible.

16528. You mean training such as they can get at Aldershot now?—Yes, at Aldershot and at Salisbury on the plains there; but even if small bodies of men are put together—you need not necessarily have a Division—and there are some guns to go with the brigade and a squadron of cavalry, and they are constantly together, it is advantageous. If you wished I could give you an instance or two of the effect of people not knowing how to work the three arms together. Take the question of escorting guns, the ordinary thing for a man not accustomed to guns to do when attacked is to lie down near the guns, but that is the last place in the world where he ought to be, and it is only by being constantly with the guns that a man gets to know that as a matter of fact he ought to take up a position to the right or left or 900 yards in front, where he can cover the guns and better protect them than if he and his men were lying down close to them.

16529. (*Sir George Taubman-Goldie.*) Does not the new drill book provide for all that?—Yes, but the drill book is not the same thing as doing the thing practically; the one is theory and the other practice; for instance, if a man going with an advanced guard, and he should have guns with the advanced guard, the probability is that if he is nervous about his guns he will have two or three battalions in front of his guns; suddenly a hot fire opens in front, there is a long pause, and last of all the guns come up; too late. Another time that man will have his guns right up in front he says, "I will not have to wait half an hour like last time." The one is theory and the other practice.

16530. (*Sir John Hopkins.*) Were you satisfied with the accuracy of the fire of the naval guns?—Yes, they were very accurate guns.

16531. And the firing was good?—Very good indeed.

16532. (*Viscount Esher.*) You have got strong views as to the teaching of initiative to young officers?—Yes.

16533. You are in command of the 1st Brigade of the 1st Division of Aldershot now?—Yes.

16534. Have you any latitude in that respect?—Could you make such changes as would lead to such an improvement as you think desirable. Yes, I command the 1st Division, the 1st Guards Brigade is in that Division, and I have ample latitude.

16535. That is to say, you have the opportunity of carrying your theories into practice?—Absolutely, and I propose to do it. It is only by letting the officers clearly understand what you want, and telling them beforehand, that you can get it done.

16536. (*Sir John Jackson.*) You referred to the land transport and the value of the traction engines if you had had coal and water; have you ever thought of the idea of utilising oil motors?—Yes.

Major-General A. H. Paget.
C.V.O.
Feb. 1903.

Major-General A. H. Paget, C.V.O.
24 Feb. 1903.

16537. Are you in favour of it?—Very strongly in favour of it.

16538. Obviously there would be great advantages in a country where you had not the coal and water handy?—Yes, a supply of oil could be carried, and it is an obvious advantage. I am quite certain that if we had had some

motors out there, with an unlimited supply of oil at our various basis, they would have been of enormous assistance.

16539. (Chairman.) Is there anything you would like to add?—No.

Major-General Sir Reginald Pole-Carew, K.C.B., C.V.O.

Major-General Sir REGINALD POLE-CAREW, K.C.B., C.V.O., called and examined.

16540. (Chairman.) You went out with the Army Corps, I think?—I went out with Sir Redvers Buller.

16541. And at that time you were in what position?—I was in the position of Camp Commandant to Sir Redvers Buller—that is to say, practically the Quarter-master-General of his own or headquarters camp.

16542. On his staff?—Yes. Then, when I arrived at Cape Town, you know what happened. You know there were no troops in Cape Colony, and eventually, having diverted all the troops that he had intended for his advance through the Orange River Colony as it is now, Sir Redvers had to go himself to Natal. When he went he left most of the members of his headquarters staff in Cape town, and, amongst others, myself. A short time afterwards the man in command of the Ninth brigade with Methuen on the relief of Kimberley expedition was hit, and I was sent up to take command of the Ninth Brigade. I arrived just after the first fight of Enslin or Graspan—Belmont was the first fight, Enslin was the second, and Modder was the third—and I then commanded the Ninth Brigade until Lord Roberts arrived when I had command of the Guards Brigade until we started from Bloemfontein for the relief of Wepener, and then I had the eleventh Division, of which I continued in command until it was broken up after Komati Poort. Do you want to know anything about the Ninth Brigade or the Modder River, or anything of that sort?

16543. Is there is any question with regard to it which you would like to mention?—No. The first head of the memorandum (*Vide Appendix, page 575 post*), which was sent to me by the Secretary to the Commission is: "The adequacy in point of strength of the forces in the field at different dates, to the work which they had to do," and I think on that I should like to say a word with regard to Methuen's command for the relief of Kimberley. It certainly was inadequate, it was inadequate in mounted men, especially, and I think that if it had been formed later on in the campaign he would not have been sent with only one regiment of Lancers and a very few mounted infantry.

16544. 120, I think?—Three companies he had, as a matter of fact. That was totally inadequate for the work he had to perform. Then besides that, his object and, as far as I recollect, his orders, were not only to get to Kimberley, but he had to relieve Kimberley, to pour in supplies, which entailed pouring them in by the railway, as there was no other means, and taking out of Kimberley a large number of women and children of the white population, and practically all the natives.

16545. That is what he said himself?—Then I am right. That meant not only getting to Kimberley which I have not the slightest doubt he could have done easily enough, but it entailed holding the railway in sufficient force to get out again. That meant repairing the railway bridge at Modder, and in order to do that he required a force of some strength at Modder to protect the working parties, and also making the line safe and sound through the very difficult country between Modder and Kimberley, a place called Spytfontein, where we expected to have to fight, but we had it at Magersfontein and therefore Spytfontein never came off. What I mean is, that we should have gone round by Jacobsdal, Brown's Drift, or Klip Drift, the way Lord Roberts went afterwards, and we should have gone straight into Kimberley and been there, I should say, 48 hours after the fight on the Modder, if we had not been hampered by the fact that we had to get out again.

16546. If you had gone round by the way you have described, the difficulty of getting out would have been very great?—We should not have got out, because we could not have put in supplies for the people there, and we could not have taken all the women and children and the native population out except by the railway; so that we should have done more harm than good. The only way of getting supplies up in sufficient quantities to do Kimberley any good, or for us to take the people

out, was by the railway, as we had not transport enough to do it otherwise.

16547. The transport, we are told, was only sufficient for two days for the force?—I believe that is right.

16548. And to put in provisions it was essential to occupy the railway?—Decidedly; to repair the broken bridges and hold the very difficult country, having first fought through it, between Modder River and Kimberley. I should not have gone to that difficult country at all to get to Kimberley; that is what I mean.

16549. And to act up to the full instructions your evidence is that you considered the force was inadequate?—I considered the force was inadequate. We made the scheme for going to Kimberley which Lord Roberts afterwards adopted; the way French went was our scheme.

16550. At later stages of the war, I suppose you found that the forces were adequate?—Oh, yes; as far as I saw myself, at later stages I do not think there was anything to complain of. I think that for some time, until, I may say, we got to Bloemfontein, the mounted forces with the infantry brigades and divisions, were not as a rule sufficient for the country, but then it is a peculiar country which requires mounted men.

16551. You mean on the march from Paardeberg to Bloemfontein?—Yes. I do not think any of us had enough mounted men, at least we would have been all the better for more. After we got to Bloemfontein we had sufficient.

16552. It was not only a question of numbers, but the horses had got so knocked up at that time?—After Paardeberg they were perfectly wretched, most of them; a good many fresh mounted infantry came up, but those that took part in the relief of Kimberley and the Paardeberg business were completely knocked up, chiefly from starvation, and so were the men.

16553. And that affected some of the operations afterwards between Paardeberg and Bloemfontein, did it not?—Yes, I do not think the cavalry ever recovered from it, until after they had been at Bloemfontein for a long time, and as to the men, I put down the great access of enteric, and the severity of it at Bloemfontein more to starvation than to anything else; very hard work under a hot sun on very small rations, and we always found that when the men were drawn too fine, as was only natural, they were liable to any disease that might be going, and enteric being the disease of the country, they got it. We who were better fed did not get it. We had exactly the same water to drink, and pretty much the same food, but we had more of it.

16554. Were the men's rations very much restricted on the march across to Bloemfontein?—I have no doubt you heard of the loss of the convoy crossing the Riet, and from that moment we were done as regards rations; if I recollect it was first of all half rations, and then I think quarter rations, but the Army did not recover from the loss of that convoy, until after they got to Bloemfontein. As I said, I thought the enteric was largely due to that.

16555. But I think your brigade of Guards marched into Bloemfontein in good style?—The men marched in very well, but my argument is this, that they were drawn too fine, and they were half starved, as well as being overworked, and that made them liable to any disease going, and that was enteric. They got it very badly afterwards when they got to Bloemfontein.

16556. After that period were you satisfied with the supplies?—Perfectly, as far as I was concerned.

16557. You always had sufficient?—Yes, but then I was usually with the centre block, nearest the railway except on the march to Dewetsdorp, and then we supplied ourselves, because the country was full of stock and full of grain, and we had no difficulty at all. After that I was almost entirely in the centre next the railway, and therefore there was no difficulty as far as I was concerned about supplies.

16558. And the quality was good?—The quality was excellent.

16559. Have you any evidence you would like to give about the quality of the men for war purposes?—I think they were very good. When we first started a large number of regiments had a great number of Reserve men, some had an average of 600 Reserve men to 400 in the ranks, and that naturally is not good. It cannot be, because not only are they raw, as a great many of them have been out of military work for some considerable period, but they do not know the officers. A great many of them had been soldiers before the non-commissioned officers under whom they had to serve, and the consequence was a poor discipline. That, of course, rights itself after a time, and I always think if we had a force ready to take the field without putting in any undue proportion of Reserves to begin with, when once the non-commissioned officers and the younger men serving in the ranks have felt their toes, so to say, on active service, then I should not mind how many Reserve men were put in, but if it is done at first it is very apt to destroy discipline. I do not say it absolutely destroyed discipline, but it made regiments not so good as they should have been; they were more like a mob than we like to see. I found that particularly at Modder River.

16560. As soon as the Reservists found their feet, I suppose the fact that they had been soldiers helped them to become very useful men?—The Reservists were quite excellent afterwards; all I mean is that if any plan could be produced whereby the chief part would not be Reservists at the start it would be very much better.

16561. (*Viscount Esher.*) Of course, it was never the theory that that should be so?—Certainly not, but that is unfortunately the effect of our system. It is exactly the same thing as regards the Guards' regiments. I think almost without exception—I am not quite sure about that regiment that marched from Gibraltar, it may not have been the case there—all the others had exactly the same ratio I mentioned—about 600 Reserve men to 400 in the ranks.

16562. Would it be a lesser evil to leave a large number of young soldiers in the ranks to go on active service? Now, of course, the cause of what you complain of is that the soldiers under a certain term of service are left behind, and the Reserve men are drafted into the battalion. Of the two evils would it be the lesser evil to leave a larger number of the recruits to go on active service with their battalions?—Well, that depends entirely on what they really are; if the young soldiers were really twenty years of age or over nineteen, I think your proposal would be better than putting so many Reserve men into the ranks, but you must remember that in a great number of regiments—I will not say in the Guards, but in a great number of line regiments—we have what they are pleased to call "physically equivalent"—sixteen and seventeen—who are not sufficiently fit in physical health, and they cannot stand it.

16563. When a battalion went out from England to South Africa, the tendency was to put every Reserve man you could get hold of into the battalion—was not that so?—I think they were obliged to do that; I think it was more than a tendency—they were obliged to do so by the regulations, because they had not the men to go.

16564. But you think they might have made that rule rather more elastic?—Yes, I think certainly something of that kind might be done.

16565. I only put the point to meet the difficulty you yourself raised?—Yes, but real boys who are not physically fit to stand the strain must not be sent. We found that years ago in Afghanistan—of course, that is a very much worse climate than Africa, and Africa is the climate of all climates for boys or young men—that the older and harder men whose constitution was more confirmed stood the strain infinitely better than the young soldiers.

16566. Of course that specially applies to hot climates?—I think it does. I am not talking about Europe.

16567. (*Chairman.*) As the regiments were constituted the physique was pretty good?—Better than I have seen it for years, in consequence of the Reserve men in the ranks.

16568. And the morale?—Very fine indeed. I had nothing whatever to complain of. I commanded altogether three brigades. The 9th Brigade was an exceptionally good one, because some of them were men who had come from other places in England, and they were not the young soldiers or the Reserve men. The 18th

Brigade was extremely good, and I never wish for any better men in any way.

16569. Were they intelligent men?—Yes, I think as intelligent as can be expected from the class from which they enlist. There were more intelligent men in the Guards Brigade than in the others, because they came from a different class, especially those Reserve men who were to a large extent men who had joined the Service on the three years' system in order to get a character for the Metropolitan Police, and we always get good men in that way. That was very much knocked on the head when they sent the Guards battalions to Gibraltar, because those men said, "Oh, no, thanks, we prefer not to join; we cannot afford it now"; but we had an exceptionally fine lot of intelligent men before the battalions went to Gibraltar in consequence of what I told you—that they joined with the bait hanging out in front of them of a preference in selection for the Metropolitan Police if they had three years' good service in the Guards.

16570. (*Viscount Esher.*) Do you say that the fact of the battalions being located abroad interfered with the recruiting of the best class of men?—At Gibraltar—it knocked it on the head, and we could not get the men at all.

16571. Do you think if that scheme was carried out of quartering a large number of recruits in South Africa that would interfere with the recruiting?—Ah, that is a different thing. I am talking about the Guards. You see, we had that three years' enlistment, and nobody else had it.

16572. However, if it was proposed to send a Guards Brigade permanently to South Africa, I suppose that would interfere with the recruiting?—You could not hope to get those men, because they join for a particular purpose. On the other hand, I believe that South Africa has such a magnificent climate for men that the material that would be obtained would improve very much on the high veldt, and, of course, there is a scope for manœuvres that there is not in this country. I think it would be a very fine school.

16573. (*Chairman.*) Manœuvres is what you look to as necessary in the future training of the Army?—I think so for every reason—manœuvres of a sort, manœuvres where there is really a scope, where men can be really taught to look out for themselves and to scout.

16574. Do you mean manœuvres such as you can get at Aldershot?—No, I do not, not at all—to a very small extent, I think.

16575. Can you get them in this country at all?—To a very modified extent; but then I do not think we must suppose that because we have learned to fight the Boer indifferently well we have learned everything with regard to other nations. That is a very peculiar country, and I do not suppose we should find that country again if we searched the world over, except perhaps in the bush in Australia. I do not suppose we should ever be so foolish as to fight in Europe, but naturally that would be a very different thing, and so would fighting in this country, or fighting in any enclosed country, and they could be taught that here.

16576. That you could teach in this country?—Perfectly, better than in Africa.

16577. Because the manœuvres would be quite different from those you had to practise during the war?—Perfectly, and I think it is a very difficult thing to say how men should or should not be trained, for that very reason. I think that whatever training is given to the men must be modified by the circumstances that are found in the country to which they go.

16578. We have had a good deal of evidence that both officers and men were unwilling to take a sufficient amount of responsibility; have you anything to say on that point?—I do not think they were unwilling to do it. I should not say that.

16579. Perhaps I should say initiative?—You mean they had not sufficient initiative?

16580. Yes?—I did not find that. I think that as the campaign went on there were circumstances that possibly prevented men from taking the initiative they otherwise might have taken. I think that is probably the case.

16581. You are speaking more of officers in that case?—Entirely of officers.

16582. But even with regard to the men was it not

Major.
General Sir
Reginald
Pole-Carew,
K.C.B., C.V.O.

24 Feb. 1903.

Major-
General Sir
Reginald
Pole-Carew,
K.C.B., C.V.O.

24 Feb. 1903.

the case that in the circumstances of the South African War generally the units became so divided that a man must take the initiative and a certain amount of responsibility?—Yes.

16583. For which his training has not suited him?—I can only tell you this, but please do not think I wish to take any credit myself, because I do not, and I am talking about the men. I had no "regrettable incident" of any sort or kind, and only, as far as I can recollect, lost four prisoners during the whole time I was there, and that was not by a surprise (they were mounted infantry men), but I must say that I never found that the non-commissioned officer or men failed in any task when they were put in a little out-of-the-way corner and had to look after themselves; they did very well. It may have been the case that the first blush of the campaign had really been gone through at that time, and they may have learned.

16584. (*Sir George Taubman-Goldie.*) You are speaking of the later stages of the war now?—No, I am speaking of the beginning, but you see when we went to Modder after the fight at Modder River we lay there for two months and therefore the 9th Brigade and the Guards Brigade had a very good opportunity of finding out how to fight the Boer and what the game was. I did not take command of the 18th Brigade until after we got to Bloemfontein, so that they also had had a considerable time to find out their job. The mounted infantry I commanded in the same way were Australians, and they had shaken down also.

16585. By that time a European war might have been over?—That is more than probable.

16586. One wants to know what the men were like during the first six weeks?—I found them extremely good as far as I was concerned.

16587. With plenty of initiative?—Plenty of initiative, I think. Of course, the men require leading; at a pinch they must require leading, but I doubt if very much better material can be got out of the class from which we recruit. I always put down the excellence of the Australians and the excellence of our Volunteers not to training—many of them were extremely raw when they first came—but to class. They were of a very superior class, and with class, as you know perfectly well, you get better education, and therefore higher intelligence. That is what really forms the superiority of the Volunteers in this country to the Regular soldier; that they are superior with regard to intelligence, and so are the Australians.

16588. (*Sir John Jackson.*) You also get a better-fed man; the man from the class from whom the Army is drawn is not, as a rule, well fed?—No, but I think it is the education. A man may not have seen or known anything of active service in his life; he may know nothing of soldiering, but if he is a well-educated man, and an intelligent man, as I think the higher class usually is, he settles down so much quicker.

16589. And particularly if he is left to himself?—Yes. Could you imagine a finer thing than a regiment of officers, taking the class from which you draw them? I would rather command a thousand of those fellows than ten thousand of anybody else.

16590. (*Sir George Taubman-Goldie.*) You think brains are more important than numbers?—In a case like South Africa, most certainly. Please do not think I am talking about the possibilities of a European war, where it is necessary to have numbers. As you said just now, a European war would have been over, and that is perfectly true, but I am talking of the experience of South Africa.

16591. But we have to draw lessons for the future from the past?—Quite so.

16592. (*Viscount Esher.*) I suppose the efficiency of these Volunteers you speak of depends to a very large extent upon their leading; the officers you put in command of them?—Yes, but I think their class gives the men more initiative than the ordinary British soldier. I think their class means education and superior intelligence, and I think they are really easier to deal with after a little active service and training. They probably improve much quicker than the British soldier.

16593. Supposing you had to take a difficult position, would you very much mind whether you were making the attack with a regiment of Regular infantry or of Volunteers? Which would you prefer?—That depends entirely on what has to be done. If a place has to be rushed, without any sagacity required on the part of the men,

it is not possible to have a better lot than a well disciplined British force, but if sagacity and real individual initiative have to be employed, I should say much better work would be got out of men like the Australian Mounted Infantry we had, or the English Volunteers; but it is impossible to lay down a fixed rule for them.

16594. (*Chairman.*) Are there any other points in the memorandum which we sent you on which you would like to offer any remarks?—There is one thing; as to the shooting capability, I thought the shooting as a rule very good, and I had no fault to find with it. The marching, I think, speaks for itself; it was first rate. As to horsemanship and horsemastership, with regard to the mounted infantry, it was excessively bad.

16595. Are you speaking of both?—Both. The man was so busy riding that he had really no time to look, and in horsemastership they were beneath contempt. I think that is the fault of our system entirely. To begin with, every British infantry regiment is spoiled when it goes on active service by taking out of it the best men, because it is necessary to have the most intelligent men and the most intelligent subalterns and captains. They are picked out, and form a Mounted Infantry Company. When we first began they allowed mounted companies to act with the regiments from which they took them, but that was very soon knocked on the head, and practically the best men and officers are taken away from the battalions to form mounted infantry. Well, they have had no training as a rule; there is a certain amount of training at Aldershot, but as a rule those men are very quickly disposed of, and those who come on afterwards have had no training whatever in either horsemanship or horsemastership, and I think the system is absolutely wrong. I think the mounted infantry are most important, and I think a body of mounted infantry ought to be properly formed.

16596. Apart from the regiments altogether?—Quite apart from the regiments altogether. I have always said so. It is expensive, I know, but it must be done.

16597. It was suggested to us that another way of doing it was to have a certain number of ponies with the regiment, and pass men through, so that a large proportion of the regiment might be qualified to act as mounted infantry?—Yes, but there must be one thing or the other, I think, because an infantry battalion is spoiled by doing that. I can quote the 5th Fusiliers as an instance; it is not as if we had one captain and two or three subalterns for a company of mounted infantry, and that that was the end of it, but the 5th Fusiliers were especially unfortunate, and I think in the first phase of the war they lost something like five captains and four or five subalterns, and they had to keep filling up and up, and the men in the same way had to keep filling up, so the regiment is drained to nothing.

16598. (*Sir George Taubman-Goldie.*) And you take the best shots and everything else?—Yes, that must be done; there must be the best intelligence too.

16599. It has been suggested, on the other hand, that the danger of a permanent mounted infantry force is that they may become bad cavalry?—Yes, we have all seen that said. If you want mounted infantry you must have mounted infantry. I believe the origin of the Dragoons was exactly the same thing as the mounted infantry now—men who could fight on horseback and on foot, and they have developed, I will not say into bad cavalry, but into cavalry. Some arrangement must be made by which that will not happen.

16600. And you think that quite feasible?—I think it could be done. Why should not that be worked out? After all it is only a matter of detail, which I think could be worked out. I do not know why we should not have a regiment and make them actually work on foot and on horseback, make them infantry to-day and mounted infantry to-morrow. That is only a suggestion, however. Anyway, do not drain the infantry battalions when they are most wanted. As to entrenchment and cover, the men picked up entrenchment quickly, and I think before they had been there very long they were equal to the Boers, which is saying a great deal, as the Boers were the best entrenchers I have ever seen. Then the next point in your memorandum is general physique, morale, and intelligence.

16601. (*Chairman.*) Those you have spoken to?—They were as good as we could have, I think. The next head-

ing is "Deductions from the experience of the war in connection with the general question of the training and duties of regimental and staff officers." The regimental officer, I know, is the target at which most people shoot, and I must say I am extremely sorry for it. The regimental officer and the regimental men absolutely fought this war, and a more devoted and a more excellent lot of officers I do not think you could wish to find. I do not think a man is wanted who has every attribute of a staff officer with his regiment; what is wanted is a man who can lead men; there must be intelligence, of course, but if reform is wanted the staff must be reformed. The staff was beneath contempt really, looking to the orders and counter orders, and after orders, and the confusion there was in the staff. I am sorry to say I do not know much about the working of the German Army, but I fancy that a general staff is the thing we want, and I do not think we shall get on without it.

16602. (*Viscount Esher.*) You have had a good deal of experience on the staff on the North-West Frontier?—Yes.

16603. How did the staff compare there—the Indian staff?—That was a very small affair compared to this; that was a one man job.

16604. (*Sir George Taubman-Goldie.*) Do you think the Staff College gives a good education for the staff?—I do not know that it does not. I am not prepared to express an opinion about that, but I do say that that education, whatever it may be, has not a fair chance afterwards with the way in which our staff is constituted in the field.

16605. And at Aldershot now, under the present Army Corps system, is there any better opportunity of exercising the staff there?—That I cannot tell you, because I have not been there since it was formed.

16606. (*Viscount Esher.*) You were not at the Staff College yourself?—No, but it is the staff in the field I am talking about; I think a general staff is wanted.

16607. Did you think among the staff officers with whom you came into contact that the men who had been educated at the Staff College were in any way superior to others who were employed on the staff, and who had never had that education?—That is a difficult question to answer; some of them were quite first rate and some were not.

16608. You did not see any marked superiority on the part of officers trained at the Staff College?—No, I should say that is a question of the individual intelligence again, and that does not alter what I say about the instruction of a general staff for the field.

16609. What you mean, as I understand, about that is that there should be trained in times of peace a body of staff officers who have been accustomed to act together, and who would be employed in time of war?—Yes.

16610. (*Chairman.*) You do not wish to go into details about the supplies?—No. We were short of food and forage occasionally, but that was inevitable, and that occasion when the convoy was lost was the worst experience we had. As to the numbers and quality of the horses, it was a matter of amazement to most of us how the country and the Quartermaster-General here managed to supply the number they did; it was perfectly marvellous, and I am quite certain no other nation could have done it. The quality at first was good, but they destroyed such an enormous number of horses by waste and by want of care, and by one thing and another, that afterwards the quality became very bad, and in the case of the Argentines it was little else than murder; the Argentines they sent were soft-hearted brutes, and I saw it time after time myself—they looked good enough, but the moment they were asked to go at a pinch they stopped dead.

16611. Had that not something to do with their not being acclimatised?—Not at all; it is the nature of the animal. The animal is a brute, and no use at all. A lot of our mounted infantry were destroyed because the horses would not move. I rode them myself, and I know what they are.

16612. (*Lord Stratheona and Mount Royal.*) Did you see any of the Canadian horses in South Africa?—Yes, some of them are very good; some of the Australians were very good too, and those I knew, of course, before in India. Some of the ponies we had from India were excellent, but the best naturally (I think it is always

the case), were the ponies of the country, the Basuto pony, as they could go further and do better with less food than any of them. The English horse was very good, the Irish pony first rate, but then he was more liable to get horse sickness. I think the English pony was just as good as the Australian, and better; but the animal that never ought to have been sent was the Argentine, which was perfectly useless.

16613. They were rejected by everybody who could get any other horses?—Yes, everybody. Mind you, there are two classes of the Argentines, as I dare say you know. There is one a very well-bred horse. Although I do not think they have a stud there, they have some very good blood, and a well-bred horse, which I have seen and ridden over country in Ireland, and which is very like an English thoroughbred, but the brutes they sent out to South Africa were a very low class of cob. They were "flat-catchers," because they looked much better than they were. They were all right until they were asked to gallop, but the moment they were asked to move they stopped dead.

16614. (*Chairman.*) Do you wish to say anything about the guns?—The rifles were excellent, better than the Boer rifles a great deal; they lasted better, and I do not think there was anything to complain of. As to the guns, there again it is impossible to say whether our own 15-pounders would not have been better in an enclosed country and a less clear atmosphere than they proved to be out in South Africa. I think you must be, to a great extent, guided by the climate and the atmosphere you are going to fight in, but out there our field guns were of no use whatever against the long-range guns of the Boers, and as to our horse-artillery guns they were like pop-guns. The best guns we had were the Naval 12-pounders and the 4·7 guns, and that was, of course, owing to the marvellous atmosphere, the distance we could see, the distance we could shoot, and the open nature of the country.

16615. (*Sir John Jackson.*) Are you of opinion that the Boers were able to move these heavy guns much better than our men could?—Yes, they certainly did so, but you must remember that they were always fighting on an inner circle, so that they had not so far to move as we had.

16616. (*Sir George Taubman-Goldie.*) And their life is also one of trekking?—Yes, and they used an enormous amount of forced labour. The Kaffirs really moved their guns and dug their trenches at the point of the whip and the rifle.

16617. (*Sir John Hopkins.*) Were you satisfied with the accuracy of the firing of the Naval guns?—Quite. The 4·7 is a much finer weapon than the 5-inch that we had, and I think the 5-inch was practically put out of the Navy for the 4·7 one. The Naval 12-pounder is a beautiful gun, I think; it is so light that we dragged it about with mules, and it could go anywhere. For instance, we took a pair of Naval 12-pounders through the most awful country I ever saw, to Komati Poort, and the bluejackets were splendid. On one occasion I wanted some horse artillery, and they had not come up, and these two Naval 12-pounders kept up with the mounted infantry through that bush in the most extraordinary manner.

16618. There was no question about the accuracy of their fire?—It was very good indeed. They did not take the time our gunners did to take angles, and that sort of thing. They put one shot over and another under, and the third was usually in the middle, and having once got it they kept it.

16619. (*Sir John Edge.*) Had you any Volunteer companies attached to the Regulars under you?—Yes.

16620. How did they do?—Very well indeed; in the 18th Brigade each of the four battalions had a Volunteer company, and they did extremely well.

16621. Did they fall into line quickly?—Yes, very; and on that I have formed my opinion to a certain extent that there is more in education and intelligence than there is in training.

16622. Have you had any experience of Volunteers at home here?—Those were Volunteers from home.

16623. You have had no experience of the Volunteers except of the men you had in South Africa?—No. I saw the City Imperial Volunteers, because they were in South Africa too. I have never had to do with Volunteers in this country.

16624. Does the experience you gained in South

Africa lead you to consider that that class of man even imperfectly trained might easily be quickly trained and made a good soldier?—Yes, and that remark

(After a short adjournment.)

applies also, as I have told you, to the Australians, Canadians, and New Zealanders, and I had to do with them all.

24 Feb. 1903.

Brigadier-General The Hon. Sir F. W. STOPFORD, K.C.M.G., C.B., recalled, and further examined.

(See Questions 931 to 1064, Vol. I., for Sir Frederick Stopford's previous Evidence.)

Brigadier-
General The
Hon. Sir F.
W. Stopford.
K.C.M.G., C.B.

16625. (Chairman.) I think you went to South Africa with Sir Redvers Buller?—Yes, I went out as Military Secretary to Sir Redvers Buller, and I stayed out with him all the time he was there.

16626. As Military Secretary?—Yes.

16627. You did not hold a command in South Africa?—No, I had no command. I remained with him all the time.

16628. But in that position you had opportunities of studying the various points that emerged during the war?—Yes.

16629. And you had had before you went out to do with the mobilisation?—Yes, I was in charge of the mobilisation branch of the War Office before the war.

16630. So that no doubt your attention was drawn in South Africa to the manner in which the mobilisation scheme worked out in practice?—Yes, I naturally took great interest in seeing how the scheme, which we had prepared, worked when put to the test of war.

16631. Would you give us your views upon that point? In the first place, before you left were you of opinion that the mobilisation had been carried out satisfactorily?—Yes, I thought, as I stated to the Commission before, that our arrangements worked well so far as it was possible for them to do so, considering that the money necessary to complete the preparations was not sanctioned until a very late date.

16632. The delay in giving you funds did cause, in your opinion, a certain amount of delay in mobilisation?—It caused delay in the completion of the mobilisation in that the troops were not completed with the necessary equipment, harness, vehicles, horses, etc., when they arrived in South Africa.

16633. Sir Redvers Buller in his evidence pointed to seven days in which he thought there had been some delay in consequence of delay in the orders; what I want to know is, was there any other cause of delay except the delay in giving you authority for the money?—Mobilisation might have been ordered earlier than it was. As far as the military were concerned, the Reservists could have been called out and the mobilisation commenced at a much earlier date than that on which the mobilisation was ordered.

16634. (Sir George Taubman-Galdie.) But you only give orders to mobilise; from the moment the orders are given it passes out of your hands entirely. You are not an executive body?—No. Once the order is given to mobilise, the mobilisation branch at headquarters ought to have nothing more to do with it. The carrying out of the mobilisation rests with the General and other officers in the district; there was no delay on their part when they had received their orders to mobilise.

16635. (Chairman.) You have been good enough to prepare a précis of the evidence which you would give, and that can be incorporated as part of your evidence?—If you please. As the secretary has informed me that the Royal Commission desire to hear any views I may have formed upon the points indicated in the memorandum (*Vide Appendix, page 575, post*) which he forwarded to me, I have prepared the following précis of my views, but I wish to point out that as I have not held a command in South Africa I had not the same opportunities of studying the points in detail as was given to officers who held commands, and who had, therefore, personal touch with the men under their command, and direct dealings with their supplies, transport, etc. My remarks must therefore be taken as those of an officer who has only indirect knowledge of the points upon which his opinion is asked, arrived at from personal observation during Sir Redvers Buller's campaigns in Natal and in the Eastern Transvaal, 1899-1900.

Adequacy in Point of Strength of the Forces in the Field.

It is hardly my province to touch upon the adequacy in point of strength of the forces in the field at dif-

ferent dates, and it is difficult to do so without criticising my superior officers, but it was apparent to everyone that the forces at the disposal of Sir Redvers Buller on his arrival in South Africa and for some months afterwards were quite inadequate to cope with the situation which he found existing in Cape Colony and Natal. On our arrival at Cape Town, Sir Redvers Buller received the intelligence that the disaster at Nicholson's Nek had just taken place, and that Sir George White had fallen back to Ladysmith, where he was surrounded. The only troops in Natal to prevent the advance of the Boer main army on the capital of the Colony, and, indeed, to the sea coast at Durban, were about 2,000 men, viz., two Regular infantry battalions and a few local Volunteers; there was no field artillery or cavalry available.

As regards Cape Colony, Kimberley was being invested, the Dutch were rising daily throughout the Colony, and the High Commissioner thought so seriously of the situation that he wished the artillery, on landing, to be retained for the defence of Cape Town. There were then in the Colony only one regiment of cavalry, three batteries of field artillery, and three and a half battalions of infantry.

An Army Corps was on its way from England, but instead of its being possible to employ it, as had been Sir Redvers Buller's intention, for an advance through the Orange Free State, leaving the Boers in Natal to be contained by the troops in that country, it was necessary with the Army Corps (a) to meet a general rising of the Dutch in Cape Colony, (b) to prevent the Boers invading the Colony, and (c) to save Natal from being overrun by the enemy. That the troops at Sir Redvers Buller's disposal were inadequate is proved by the fact that more than an Army Corps was subsequently required for the operations in Cape Colony and the Orange Free State alone. The portion of the Army Corps which could be spared from Cape Colony (and which had only just arrived in Natal in time to save the capital) was inadequate for the task of taking the Boer entrenched positions on the Tugela—positions described by General De Wet in his book, "The Three Years' War," as "stronger than any other English general in South Africa had to operate against."

Quality of Men of the Regular and Auxiliary Forces.

The general physique and moral of the Regulars were excellent. As I had been connected with the mobilisation of the force sent out from home, I was much interested in observing the effect on battalions, squadrons, batteries, etc., of having Reservists in their ranks. It had been thought by some that they would have lost to some extent their energy and military knowledge. The general opinion in Natal was quite the contrary. They were excellent, and the steadiness under fire of the troops, under conditions of modern warfare which they had never before experienced, such as heavy artillery and rifle fire from an absolutely unseen enemy, was due in a great measure to the presence in the ranks of a large proportion of experienced, well-disciplined men, who set an excellent example to their younger comrades. Such regrettable incidents as a panic or surrender of unwounded men were practically unknown in the Natal Army. The war has shown that our system of short service and Reserves is a sound one as far as service in the field is concerned.

As regards intelligence, many of the men who join the Army have not the same educational qualifications or practical experience as have men belonging to Colonial corps, and they have not had to exercise their intelligence to the same extent as the latter. The war has brought prominently to notice the necessity in our training of cultivating and improving the individual intelligence of the private soldier, without impairing the discipline, which is as essential now as ever it was. What was specially required in the severe fighting of large bodies, such as was experienced by the Ladysmith Relief Force, was intelligent leading on the part of the company officers, and implicit obedi-

ence to, and faith in, those officers on the part of the men. As the officers and men gained experience in front of the enemy, the leading improved, and they rapidly picked up their duties, and adapted themselves to the existing conditions, with the best results. The leading of the officers and quality of the men were given a very high test during all the fighting on the Tugela, and especially during the fortnight's continuous fighting, day and night, which immediately preceded the relief of Ladysmith, and again at the fights of Alleman's Nek and Bergendal, where strong entrenched positions were taken at the point of the bayonet. Nothing could have exceeded the coolness and discipline of the artillerymen under fire on all occasions, but our system of fire tactics left room for improvement; but here again the intelligence of the officers saved the situation. I had no personal opportunities of seeing the cavalry in action.

The shooting capabilities of the infantry were satisfactory on the whole, but there was room for improvement. The Boers told us that our fire was very deadly at the commencement of an action, but that after an hour or so it deteriorated.

The Natal Army had not the same amount of marching as the forces in the Orange River Colony, but its marching qualities were excellent, and the manner in which the infantry climbed the rugged mountains at the Tugela, Biggersberg, Botha's Pass, and the Mauchberg, was deserving of the highest praise.

As regards entrenchment and cover, the troops did not at first realise the necessity of entrenching themselves as soon as they had gained a position, but they soon learned their lesson, and every man on the Tugela soon became an adept at providing himself with cover. The Natal campaign gave the men of all branches of the service such experience in shooting, marching, taking cover, looking after themselves, cooking, etc., that by the time Ladysmith was reached I do not think anyone would wish to see a more perfect fighting machine than the troops which marched into that town on its relief.

There were no Yeomanry or Militia battalions in the Natal Army. There were some Colonial mounted troops in it, notably the South African Light Horse, and Thorneycroft's, and Bethune's Mounted Infantry, who did excellent work, and during the operations in the Eastern Transvaal subsequent to the relief of Ladysmith, Strathcona's Horse joined the forces; they were first-rate in every way.

Training of Regimental and Staff Officers.

I think the regimental officers have been unduly criticised, and as I have already mentioned, they performed excellent work, and led their men with great bravery, zeal and intelligence. They had had no previous training of war on a large scale, under present conditions, but they very soon adapted themselves to those conditions, with the best results. What is wanted is a system that will give the junior officers more power of initiative, and encourage them to act more on their own responsibility.

As regards staff officers, the organisation of the staff of divisions, brigades, etc., which had been compiled prior to the war, worked fairly well. Officers who had had no previous experience of staff work, and had had no staff training were naturally handicapped in comparison with those who had those advantages. The necessity for a careful system of staff training was proved; as, indeed, was to be expected.

Equipment, Supplies, etc.

I am not in a position to go into details regarding supplies, equipment, etc., but thanks to a good system of organisation, both of supplies and transport, it may, I think, be taken that every unit of the Natal Army, and subsequently of the force operating in the Eastern Transvaal, was always well supplied with ammunition, equipment, food and forage. Similarly, I cannot give details as regards the adequacy of the medical and Engineer services. I believe the medical arrangements to have been excellent, and the wounded and sick were well looked after, and were sent down from the front under a well organised system, to hospitals which were established in healthy situations in Lower Natal. The Engineer services were well carried out, the telegraph and bridging arrangements being specially deserving of praise.

Effectiveness of Guns and Rifles.

The actions showed that the effect of modern shrapnel against troops in the open, or behind very slight cover, is satisfactory when the range has been found, and if the fire is controlled and concentrated on the objective. Against entrenchments, however, gun shrapnel had little effect, either moral or physical, and a more searching fire, such as we obtained from the field howitzers, with their steep angle of descent, is imperative in an attack on troops behind cover. Greater range for both guns and howitzers was often required, and may again be required under similar conditions of atmosphere and visibility.

The Lee-Metford rifle stood the test of the campaign very well, and proved a thoroughly reliable weapon. There was a desire on the part of the cavalry for a more effective and longer-reaching weapon than their carbine.

Use of Different Arms under the Conditions of Modern Warfare.

As regards the use of different arms under the conditions of modern warfare, the value and practicability of using heavy artillery with a field army were clearly demonstrated. The want of a long ranging gun of heavier calibre than the weapon with which the horse and field artillery were armed was felt at the beginning of the war to cope with the heavy artillery brought into the field by the Boers. This want was met by the employment of Naval guns, viz., 12-pounder and 4.7-inch (brought up from His Majesty's ships at Durban, and mounted on improvised carriages), and subsequently by 5-inch artillery guns, and it was found that these heavy guns were sufficiently mobile to keep up with the infantry. As an instance of their mobility, I may mention that during the fighting near Lydenburg, in the autumn of 1900, a battery of 5in. guns accompanied Sir Redvers Buller's force, which drove the Boers over the Mauchberg, which is over 8,000 feet high, a rough and practically roadless country.

The value of mounted men who are good shots was brought prominently to notice, and I consider that in future campaigns the value of a force of mounted men who are good riders and good rifle shots will be immense, but to get the greatest value out of such a force, the men must be thoroughly well trained in horsemanship and horse management, and every man must be a picked shot; in fact, the two paramount qualifications must be good horsemanship and good marksmanship. Such a force will, I think, have a great rôle in European as well as in South African warfare.

16636. I do not know that I have any question to ask you with regard to the strength of the forces in the field. In that part of your précis you deal with the circumstances as they are known to have existed at the time?—Yes.

16637. Then we come to the point that I was speaking of at the beginning: that as you had been connected with the mobilisation of the force sent out from home you were much interested in observing the effect on battalions, squadrons, batteries, etc., of having Reservists in their ranks?—That I naturally took great interest in, and as I have mentioned in my statement, I thought that the fact of having Reservists in the ranks was an undoubted benefit to the units—that the presence of trained, seasoned men in the ranks was an undoubted good. The fears of certain people before the war, that the fact of the Reservists having been some time away from the colours would make them slow or lose their military knowledge, were not borne out. I think that our system of short service with Reserves joining the ranks in time of war is a sound one.

16638. Do you know, with regard to those regiments that you had in Natal, what sort of proportion there was between the Reservists and the other men?—I should think there were about 50 to 60 per cent. of Reservists.

16639. And you see no objection to such a number as that?—No; none whatever.

16640. We have had evidence to the effect that, at any rate at first, until the Reservist became acquainted with the conditions it was apt to interfere with discipline. Did you observe anything of that sort?—I cannot say that I saw anything of the kind at all. I think the Reservist was quite as well behaved a man as the young soldier, and, having had previous ex-

24 Feb. 1903.

perience in soldiering, he settled down quicker to life on active service than the others.

16641. Please do not understand me to suppose that the Reservist was not a perfectly well-behaved man, but evidence has been given to the effect that, owing to the Reservist coming back to a regiment in which he found perhaps non-commissioned officers—younger men than himself—and the conditions of service, and, perhaps, of the arms even being different from what he had been accustomed to, there was almost necessarily a time during which the regiment had not amalgamated?—That is possible, but I should not have seen it personally, because, owing to the nature of my work, I was not in very close touch with the regiments; but I did not hear any complaints on the subject from officers. On the contrary, I heard good spoken of the effect of the presence of Reservists in the ranks.

16642. Do you not think that difficulty would arise more if the proportion was so large as 60 per cent.?—It might possibly have that effect.

16643. That was, in fact, the proportion that was given to us, that there were regiments in which the Reservists were something like 60 per cent., and that a difficulty was felt?—I can imagine there being an initial difficulty, but I should think it would very soon wear down, and it certainly did so.

16644. Would that difficulty arise chiefly in regiments coming from home?—I should think probably it would. I put it this way: The regiments coming from abroad would be much stronger in seasoned men and the proportion of Reservists in the ranks would consequently be much smaller. In case of mobilisation for home defence the proportion of Reservists would be very much less, because men of much shorter service and younger men would be in the ranks than was the case in the late war.

16645. But in this case in South Africa you left at home a very large proportion of young men?—Yes, I think I gave the Commission the actual details of the case the last time that I was examined.

16646. But that would account for this question of 60 per cent. of Reservists in the regiments coming from this country?—Yes, there would be nothing like that proportion for the ordinary conditions for service at home.

16647. Was there any calculation as to what the probable proportion would be for the regiments that went out?—Yes, it was worked out actually. After this lapse of time I could not speak accurately as to this without seeing the figures.

16648. But, generally, what would you have anticipated the proportion of Reservists to men with the colours would have been?—I should think, out of a battalion of a thousand men, it would be from 150 to 200 for home defence if battalions were up to their peace establishment.

16649. (Sir George Taubman-Goldie.) But we had 80,000 Reservists in the country at the time of the outbreak of the war?—For South Africa there were 50 or 60 per cent. of Reservists in the ranks, but supposing the mobilisation were for home defence, the number of men who would be retained in the ranks on mobilisation would be so much greater, that the number of Reservists required to complete would not be more than about 200, supposing battalions were up to their peace establishment on mobilisation being ordered.

16650. That is 20 per cent. of the regiment?—Yes.

16651. But 80,000 men would constitute more than 20 per cent. of any army we are likely to have at home?—Ycs. The Reservists not required to complete the units up to war establishment would be in reserve until they were required.

16652. You would only call out that number?—That does not follow. All the Reservists would probably be called out, although they would not all be required in the first line.

16653. Section A you mean?—No. Supposing there were a large war; for home defence or on the Continent, all the Reservists would probably be called up, but would not be utilised at once in the first line.

16654. Let us have it quite clear. If you call up 80,000 men you would require more than 200 men to a battalion to make up the fighting line, would you not?—The number required to make up the fighting

line is irrespective of the total number of Reservists available. It depends upon the number required to bring up each unit from its peace strength to its war establishment, which is a fixed establishment.

16655. And you put them as only 200 per 1,000 as the maximum?—I should not like to say what would have been the actual number for every battalion in the Army at the time of the war, supposing the mobilisation had been for home defence. It would vary so much in different battalions, consequent on their actual strength at the time of mobilisation, but a battalion which was then up to its peace establishment would require about 200 to complete it to its war establishment.

16656. (Chairman.) What I understand is, that though there were nearly 80,000 Reservists available, the mobilisation scheme did not imply that the whole of those 80,000 were to be at once put into battalions of the Army?—Only as many Reservists as would be required to make up the units to their war establishment would be utilised in this way. By having a fixed war establishment for each unit the details as regards its equipment, transport, etc., can be worked out beforehand, any surplus Reservists to that establishment would be kept in reserve until required.

16657. To fill up, say, the casualties?—Yes. The war establishment is an absolutely fixed one, as by fixing the establishment all the mobilisation arrangements are very much simplified.

16658. (Sir George Taubman-Goldie.) I quite understand that, but I gather from the figures before the Commission previously that there would be more than 200 men?—I may be quite wrong, that is my impression, from recollection, as to the numbers required for a battalion which is up to its peace establishment. I could get you approximately the correct proportion.*

16659. (Chairman.) I should be very glad if you would. But you are of opinion that your experience in Natal with regard to Reservists shows that the short service, the Reserve system, is sound?—Yes, I certainly think so.

16660. Then as to intelligence, with which you deal next in your précis, that was a matter which developed very much as the war went on?—Yes; as I have stated in the précis, I think that the men certainly gained their experience quickly, and that what is most required now in training is to encourage that individuality, but at the same time not to loosen the discipline in doing so. That was the point I wished to make.

16661. You put it as strongly as this: that by the time Ladysmith was reached you do not think anyone would wish to see a more perfect fighting machine than the troops which marched into that town on its relief?—I thought they were as good as they could be in every particular.

16662. That means then, if I understand it aright, that men recruited from the classes from which our Army is recruited, can be developed into a perfect fighting machine?—Yes, I think so. I think for the fighting we had before we got into Ladysmith, which was of a severe kind, attacking very strong positions, that the class of man we had was exactly the man you want.

16663. He is sufficiently intelligent, you think, to be trained into a good soldier?—Quite. We were fighting in large bodies, under difficult conditions, and I think that the fact of some of the men being rather of a roughish nature was all the better.

16664. But there has been a good deal of criticism of the class from which the Army is recruited. Your experience then, would lead you to suppose that so far as that is concerned it is more a matter of training than of class?—Yes, I think it is. I should be very sorry to see the Army without a large proportion of the hard, strong, navy class in the ranks. He makes a magnificent fighting man. A certain number of men enlist who are not the class we require, either in character or physique, but very few of them complete their service or pass into the Reserve.

16665. But do you get the navy at present?—I think some of the men we had who had been in the Reserves were as fine specimens of that class of man as you could wish to see.

16666. You are speaking more of the Reserves than of the recruit as he comes into the Army?—I think the recruit will grow into that, though when he enlists he

* The witness subsequently wrote that the proportion of Reservists which would be required to complete a battalion which was up to its peace establishment, in the event of a mobilisation for Home defence, was about 200 men.

is very young, and he has not, as a rule, developed into the same class of fighting man as the Reservist is.

16667. It has been put in this way: That a smaller army drawn from a more intelligent class would be of equal value to a larger army drawn from the class which we, at present, recruit from. Is that your opinion?—I think that the more intelligence you have in the ranks the better, if you do not get the intelligence at the loss of discipline and physique.

16668. In what way?—I should be sorry if in training our men to use their intelligence the result was in any way to lessen the discipline that at present has made our Army a good fighting army. I think there is a tendency to believe—I do not mean to say in military ranks—that intelligence without careful training will make a man a good soldier. I do not hold this opinion.

16669. But there are differences of intelligence between different classes in society, no doubt?—Yes.

16670. And the question is, whether if you take a more intelligent class, you could do with fewer men, and have an adequate training without any loss of discipline?—Possibly, but I should be sorry to see the navy class eliminating from our ranks.

16671. But still, so far as I understand the sentence I have just read, the result of the training of war upon the troops that we actually have at the present moment, was that it made them, in your opinion, a perfect fighting machine?—Yes; if you take the men who fought at Pieters, and took those strong positions there, I do not think one could wish to see better soldiers for that class of work.

16672. (*Viscount Esher.*) You mean that you do not like the idea of the soldier having too much independence of thought?—I should like to see him trained into independence of thought, but not at the expense of discipline.

16673. (*Chairman.*) You have no experiences of the Yeomanry or Militia?—None in South Africa.

16674. And only of the South African Colonial troops?—We had troops raised in the country, Colonial mounted infantry, and after we left Ladysmith, Strathcona's Horse.

16675. Do you think well of them all?—Yes. I think that they learned their work quickly, and did exceedingly well.

16676. They, of course, had had very short opportunities of training?—Yes, it was short, but it was continuous, and they improved very much. I do not say at first they were as good as they were afterwards, but they were hard at it continuously. I suppose no body saw more fighting than the South African Light Horse and Bethune's and Thorneycroft's Mounted Infantry. They were, in fact, fighting practically every day.

16677. I rather think we have heard that they were recruited from an intelligent class; was it not, therefore, for that reason that they adapted themselves so well in a short time with little training?—It may have been to a certain extent, but I did not think, from what I saw of them, that they were of a very much different class from the British soldier. I am speaking of those that were raised in the country. They were very much of the same class as our soldiers. They were men who had knocked about the world a good deal, and had more experience, but I do not think they were from a different scale.

16678. (*Sir George Taubman-Goldie.*) They were men of wide experience in all sorts and condition of life?—Yes, that is so. I think they were of the same class as our men, but had more occasions for looking after themselves.

16679. They had been practised in initiative during all their lives—from the time they were men?—Yes, I should think a great many of them. I am not now speaking of Strathcona's Horse, who were a different class of men.

16680. (*Chairman.*) But you saw Strathcona's Horse?—Yes, they were with us for some time, and they were excellent. They were a different class, and I should have thought that they were men who had had a certain amount of semi-military work before—police work; they gave one that impression.

16681. In the training of officers, what is wanted, in your opinion, I understand, is to give them more initiative?—Yes, I think that is so.

16682. And to train them to act upon their responsibility?—Yes.

16683. How would you propose to do that?—I think I might give you as an instance, the method adopted by Sir Redvers Buller when he was commanding the First Army Corps at Aldershot two years ago, which was very much appreciated by all the officers serving under him, and which had a very good effect. Whilst the operations were going on he never interfered with the officers, but always watched them, and saw what all ranks were doing. He never practically found fault at the time with what they were doing, but after the operation, the next day, he used to take out the officers and go over the whole of the work again, ask their reasons why they did so and so, and explain and correct any mistakes they might have made. I thought the system was much appreciated by the officers, and that it had a very good effect upon the training of all the troops. That is one way in which I think you could encourage officers to take responsibility without interfering with them whilst doing so.

16684. And in regard to staff officers, what have you to say?—I speak rather diffidently, as being a staff officer myself, but I certainly thought that the officers who had had staff training had an advantage over those who had had none.

16685. Do you mean Staff College men?—Yes.

16686. I suppose there were a good many officers on the staff in South Africa who had not been through the Staff College?—There were a good many, but there was a very fair proportion of officers who had been through the Staff College, or who had been adjutants, and done a certain amount of staff work. I certainly think that the Staff College training is an advantage to an officer.

16687. And that it would be an advantage to the Army if more men could go through the Staff College?—Certainly it would.

16688. I suppose, as a matter of fact, in South Africa there were not enough men who had been through the Staff College to supply the staff?—Yes, but I do not think it would be advisable to shorten the course at the Staff College.

16689. Would you give your reasons?—I think our officers should have as complete a staff training as have officers of other European nations. With the exception of Austria and Russia, who each have a two years' training, every nation on the Continent gives their officers three years' training in their Staff College. We give ours two years, and during that training they are attached to other arms, whereas abroad officers are attached to other arms in addition to their Staff College training. I think the course should not be reduced without very careful consideration.

16690. Does that apply to all grades of the staff?—Yes; I know myself I thought that what I learnt at the Staff College was of very great service to me. I think more officers should go to the Staff College, but I do not consider that they should do a shorter course than at present.

16691. If the course cannot be shortened, the only way to enable more officers to go to the Staff College will be to increase the accommodation at the College, will it not?—I am not sure that that would be necessary, but the present Commandant, Colonel Miles, could give the Commission, if thought well, much better details than I could, because it is many years since I was there. I understood from him that the number of students could be increased without any great increase of the building, that the halls, and so on, are large enough for a greater number of officers, and that many of the officers are married and could live in the neighbourhood, as some of them do now. But I am afraid I am not quite competent to speak on that point.

16692. That is not a point that you wish to deal with?—No. It is several years since I passed the Staff College, so that I do not know how matters are arranged there at present.

16693. As to guns, you agree with other evidence that we have had that shrapnel by itself is not quite sufficient?—Yes. We found that when the enemy were under cover we required howitzers with a steep angle of descent to assist the shrapnel. The shrapnel had no doubt the effect of keeping the enemy hidden in their trenches, and this was a great advantage in the attack of positions as the enemy's fire was kept down, but shrapnel had not the same effect as regards killing and demoralising the enemy in the trenches as the howitzers had, for the enemy knew that

Brigadier-General The Hon. Sir F. W. Stopford, K.C.M.G., C.B.

25 Feb. 1903.

Brigadier-General The Hon. Sir F. W. Stopford, K.C.M.G., C.B.

24 Feb. 1903.

the latter could kill them even when hidden in their deep trenches, which the former could not.

16694. (*Sir George Taubman-Goldie.*) You are not raising the question of the difference between shrapnel and common shell, but the difference between shrapnel and howitzers or mortars?—I meant to emphasise the fact that gun shrapnel by itself is not sufficient, but that howitzers were a powerful adjunct to it—as we found in Natal where the howitzers did most excellent work.

16695. (*Chairman.*) What do you say about common shell? Some officers have said that common shell is necessary?—I would sooner have howitzers than common shell from guns, though I must say that the effect of common shell fired by the naval guns at Pieter's was very great indeed, because they were able to play on the trenches until almost the last moment, much longer than would have been possible with shrapnel.

16696. But the ordinary field gun does not carry common shell?—No, but they can use percussion shrapnel as common shell if considered necessary.

16697. They are not taken by the batteries?—No, common shell is not taken.

16698. What officers have said to us was that in their opinion common shell ought to be always carried by a battery and used. Was that your experience also?—I should prefer a combination of shrapnel with field guns and howitzers.

16699. That is the way you would meet that particular point?—Yes. I am not an artillery officer, but that is my impression.

16700. You also mention the heavy artillery?—Yes, we certainly found that we were at first out-ranged by the Boers, and the heavy artillery was most useful. We also found it was quite practical to take the heavy guns over very rough country indeed. We found that heavy guns could be taken with infantry over almost any country. We took them over the Mauchberg, which one would have thought was only suitable for mountain guns.

16701. (*Sir George Taubman-Goldie.*) What guns do you mean?—Five-inch guns.

16702. (*Chairman.*) I think it was put to us that as it stands the horse artillery were too weak, but that you might get the field artillery so adapted as to go with the cavalry or with the advancing line, and rely upon the heavier guns of which you speak for the infantry?—I have heard this, but it must be remembered that mobility on the battlefield itself is essential for most of the artillery, both for prearranged successive advances under fire and to meet unexpected developments. Heavy artillery will be most useful, but cannot move except at a walk, which would be useless for the above purposes, and if attempted under fire would be fatal.

16703. And with regard to mounted infantry, which has come out so prominently in this campaign; you think that they will also come into observation in European wars?—Personally I do. I believe that any army that has a really well-mounted body of men, who are really good riders and good horsemasters, and at the same time are good shots, will have a very great advantage over an enemy who has not such a force.

16704. No doubt the conditions in South Africa were particularly favourable to such a force?—Yes, but I think also in Europe the same thing would apply. The men would have to be more highly trained in riding than many of our present mounted infantry are.

16705. And what about home defence?—I think they will be of very great value; the local Yeomanry, if trained on these lines, would be of great value.

16706. Even in a very enclosed country like England?—Yes, I think so, especially men who know the country well and have made themselves acquainted with local lanes, etc. The fact of the country being enclosed will be in their favour if they know it well, as they will be able to fire from hidden positions which they can get to and from by their knowledge of the country.

16707. It has been stated before us that in a very enclosed country like England, with good roads, you might do away with the great expense of a mounted corps such as the Yeomanry or Mounted Infantry Corps, and get the same amount of mobility by the use of other means—bicycles, and so on. What is your opinion with regard to that suggestion?—I do not believe a bicycle corps would replace mounted troops. We tried a bicycle corps a year ago at Aldershot, and I must say that I was

not impressed by the advantage to be gained by using them in large bodies, though I fully realised their importance when used in small units.

16708. For what reason?—For one reason, they take up such a great amount of room on the road.

16709. (*Sir George Taubman-Goldie.*) More than horses?—Yes, because, for instance, going down a hill they must be two or three bicycle lengths apart when they are moving in large bodies; they cannot be kept in tight touch of one another.

16710. (*Viscount Esher.*) And their mobility is not so great as that of a horse? They can only go along roads?—They can only go along roads.

16711. (*Sir George Taubman-Goldie.*) On the other hand, they do not require feeding?—They were most valuable for small bodies of men, but many of us were disappointed as regards their use in large bodies.

16712. Were you trying experiments with motor-bicycles?—No, we have not done that.

16713. With those you can go as close as you like?—Possibly, but they would be rather expensive.

16714. (*Viscount Esher.*) They want feeding too?—Yes.

16715. You have told us how you would propose to improve the initiative of the senior officers, but how did you propose to improve that of the junior ranks of the Army?—By practically the same system; that is to say, by giving the officer in command of a company a free hand to command that company, and by supervising him in his work without interfering with him during his work.

16716. Has anything been done in that direction lately at Aldershot?—Yes; it depends to a certain extent upon the individual commanding officers.

16717. But has the General Officer Commanding at Aldershot given any special instructions or advice to officers under him on those particular points?—Advice, yes. I do not think he has lately given any instructions in writing, but he has constantly spoken to officers about it, and it is in our books of instruction, and is well understood.

16718. It has always been in the books, has it not?—Yes, of late years.

16719. You see, so many officers have told us that that is one of the great practical lessons of the war, and what we are not quite clear about is as to how that great lesson has been tried, if it has been tried at all?—At Aldershot it certainly has, and is now being tried.

16720. You have had large experience, and must have seen great changes yourself during the last few months?—I do see great changes in the last few years. The whole tendency now is to let the officer commanding his company command it without interference. There are certain individuals who do not carry it out perhaps as much as others, but in the training of the troops at Aldershot that is the line on which it is worked.

16721. You do not go below a company at all?—Not as a unit.

16722. You take that as the unit?—Yes, but an officer who commands a company wisely would leave his subalterns to look after their half-companies, and they would also encourage the non-commissioned officers in command of sections. But the person responsible for the company is the captain.

16723. Do you think that the company officer gets in these days any special credit if he shows any peculiar capacity for dealing with his company?—Yes, I think he does.

16724. He does not get promotion, does he?—Not specially.

16725. Nor does a lieutenant if he shows any peculiar capacity or power of hard work get any practical advantage from that, does he?—Not at the moment, but I think it is known, and well known, which officers are doing their work best, and this is of advantage to keen officers.

16726. I suppose he would be well mentioned in his confidential report?—Yes.

16727. But when it comes to promotion, when a vacancy occurs and an officer is promoted to a company, as a rule the senior subaltern is appointed?—Yes, as a rule, if considered fit for promotion.

16728. In your experience have you ever known the—

case of a subaltern being passed over for another who had done better and shown more aptitude?—I have known officers not promoted because they were not considered fit for promotion, owing to the manner in which they had commanded and trained their company.

16729. Is not that rather when you come to the higher ranks, when it comes to a question of the second in command of the battalion?—I know the system is not promotion by selection in the lower ranks, as a rule, but an officer who was not up to the work would not be promoted.

16730. Then, what encouragement is there to a young officer really to work hard in his profession in the way that people work hard in any other profession; not very much, is there?—Perhaps not very much as regards increased prospects of promotion. He has the chance, of course, of being adjutant of his regiment.

16731. Then, I will ask you a question about the mounted infantry. What is your view about mounted infantry; do you approve of the present system of forming a company of mounted infantry per battalion?—As compared with what system?

16732. Of having a regular force of mounted infantry?—I think the system of taking a company from each battalion is a better system than having a regular battalion of mounted infantry, in that it is so much more elastic; you can train so many more men, unless a large number of mounted infantry battalions were raised. It is rather a large question of Army organisation. If you had only a very small number of mounted infantry battalions you would lose the services of a great many men serving in infantry battalions who would make very fine mounted infantry.

16733. Was Colonel Godley, who at the present moment is responsible for the training of the mounted infantry at Aldershot, out in South Africa?—Yes, he was in Mafeking during the siege and served in South Africa after the siege.

16734. I suppose he has more experience than anybody else at the present moment of the actual training of mounted infantry?—I should think he has.

16735. (Sir John Edge.) I suppose that every officer in the regiment knows that his confidential report depends upon his diligence and his capabilities?—Yes, I am sure he does.

16736. And there are other adjutancies open, I suppose, to men in the regiment?—Not as a rule. The adjutancies, as a rule, would be kept to the regiment.

16737. I understand that the adjutancy in the regiment would be kept to the regiment, but it might be necessary to get an adjutant for the Militia battalion?—Yes, the Militia battalions are a portion of a territorial regiment.

16738. It would probably come from the regiment?—The adjutancy of a Militia battalion would, as a rule, be held by an officer serving in the regiment.

16739. It might be necessary to get an adjutant for the Volunteer battalion attached to the regiment?—Yes.

16740. And a subaltern in the regiment would know he had that to look forward to?—Yes. I must say my own personal opinion is that I should like to see a system by which a good officer would realise that his chances of promotion were hastened owing to his good work, more than is the case at present.

16741. I am speaking of what may happen under present conditions. A subaltern in the regiment would know that there were several chances open to him if he were a good man?—Yes, I think so.

16742. Then I suppose when it comes to be the question of second in command, or commanding the regiment, the confidential reports are looked into?—I should think so. I imagine they are.

16743. (Sir John Hopkins.) You had with you on your various expeditions against the enemy round Ladysmith some Naval large 4·7 guns?—Yes, 4·7 and 12-pounders.

16744. Did you see practice from them at any time at the enemy?—Yes, constantly. I was with Sir Redvers Buller the whole time, and naturally, being with him I saw a good deal of the artillery work.

16745. Was it good?—Very good indeed.

16746. The 4·7 and also the 12-pounders?—Yes, both.

16747. Of course, our own field artillery were greatly

outranged in many places?—Yes, they were outranged very much at first.

16748. And then Naval guns came in?—Yes, they came in most usefully.

16749. With great effect?—Yes.

16750. (Sir George Taubman-Goldie.) I just want to go back for a moment to the evidence that you gave us as regards the mobilisation, and sending out the troops before the war. There was one point, I think, that you were not examined on. Would it come within your department to receive orders to send out cavalry and artillery, especially at first, in case such an order was given?—The order as to the despatch of troops after mobilisation would not emanate from the Mobilisation branch.

16751. But as attached as Military Secretary to Sir Redvers Buller, do you remember the fact that there was a great outcry at the time about cavalry and artillery being wanted at the Cape, because, of course, the horses had to be kept some time there before they were fit for service?—Yes. There was a want of mounted troops in South Africa at the time of Sir R. Buller's arrival in South Africa.

16752. Can you remember at this moment whether there was anything in the cry; whether there was any delay in sending out cavalry and artillery?—I cannot say, because I left England before the mobilisation was complete.

16753. So that you could not give evidence on that point?—No, I could not.

16754. You spoke just now about Reservists falling quickly into their places. From your experience how many years do you think a man, on the average, would retain his memories of military training; that is to say, how long after he leaves active service would you rely upon him as a trained soldier in the Reserve?—I do not think that our term of five years' Reserve service was too long at all.

16755. My point was this. For how long after a man leaves the ranks could you count upon him as a trained soldier to return as a Reservist?—You are speaking of infantry?

16756. Of infantry only; there must be some limit of time?—I think you could count upon him as long as he is fit physically for his work. I do not think he would lose his powers of soldiering for seven or eight years or more. He would, of course, be all the better for a certain amount of training whilst in the Reserve.

16757. By soldiering powers you mean his habits of discipline and his military habits?—Yes, I think it would come back to him. It would depend upon the man, but I think he would keep his soldierly habits for a good many years.

16758. As regards both discipline, drill, and military habits generally?—Yes, I think so, but he should be occasionally trained, especially in musketry.

16759. Your mobilisation department is really a thinking department, is it not?—To a great extent.

16760. You plan schemes of mobilisation?—Yes.

16761. And when, of course, those schemes are planned the actual working of them falls upon the depôts of various people all over the country, does it not, the actual calling out of the men?—Generals commanding districts draw up local mobilisation regulations based upon the Army Mobilisation Regulations which are drawn up beforehand by the department.

16762. Still, that is all a thinking department?—Yes.

16763. And you are now amalgamated with another thinking department, the Intelligence Department?—The Mobilisation Department has since I left it been placed with the Intelligence Department, under the Director of Military Intelligence and Mobilisation.

16764. I should say your department and the Intelligence Department are thinking departments?—Yes.

16765. So that you may really say that your present department is now really a thinking department, a scheming department?—I believe so.

16766. You prepare schemes of mobilisation and strategy, and schemes of defence and offence all over the world?—I believe so.

16767. And it is not an executive department in any sense?—I think not.

Brigadier-General The Hon. Sir F. W. Stopford, K.C.M.G., C.B.

24 Feb. 1903

Brigadier-General The Hon. Sir F. W. Stopford, K.C.M.G., C.B.
 24 Feb. 1903. 16768. (Lord Strathcona and Mount Royal.) Do you consider that the Canadian mounted troops who came under your observation showed intelligence in scouting, and were especially expert and serviceable in that respect?—I thought very much so. I did not see the actual scouting myself, but my impression formed of the regiment as a whole was a very high one. We

all formed a very high opinion of their intelligence and soldier-like qualities.

16769. They were used a good deal in scouting?—Yes, they were; and I believe they scouted very boldly and very well.

16770. (Chairman.) Is there anything you wish to add to your evidence?—No, thank you.

FORTY-FIRST DAY.

Wednesday, 25th February 1903.

PRESENT :

The Right Hon. the Earl of ELGIN AND KINCARDINE, K.G., G.G.S.I., G.C.I.E. (Chairman).

The Right Hon. The Viscount ESHER, K.C.B., K.C.V.O.
 The Right Hon. The Lord STRATHCONA AND MOUNT ROYAL, G.C.M.G.
 The Right Hon. Sir GEORGE DASHWOOD TAUBMAN-GOLDIE, K.C.M.G.

Admiral Sir JOHN OMMANNEY HOPKINS, G.C.B.
 Sir JOHN EDGE.
 Sir JOHN JACKSON.

BERNARD H. HOLLAND, Esq. (Secretary).

Major-General Sir W. F. GATACRE, K.C.B., D.S.O., called and examined.

Major-General Sir W. F. Gatacre, K.C.B., D.S.O.
 25 Feb. 1903.

16771. (Chairman.) You went to South Africa with the Army Corps, I think, in command of the Third Division?—I did on paper. On arrival in South Africa I reported myself to General Buller, and he told me that there were no troops in my Division at present, but that he would give me some as soon as they arrived. In about three or four days (about the middle of November) he sent for me and said that there was a Battalion of the Royal Irish Rifles arriving, and that I was to join their steamer and take them up to the eastern side—the East London line. On that I joined the ship and went across to East London with the Royal Irish Rifles—800 men. They were my Division till the end of the month.

16772. You have been good enough to prepare a statement in answer to the Memorandum *Vide Appendix page 575, post*, which we sent to you, and you would put it in as your statement on the general points?—Yes.

The adequacy, in point of strength, of the forces in the field at different dates to the work which they had to do.—On this point I can only speak of my own force, if called upon to do so by the Commission, as my action while commanding the Third Division has been criticised by the Commander-in-Chief.

As to the adequacy of the force at my disposal, however, I would merely say that my Division consisted of one Infantry regiment 800 strong when I took command, that it strengthened gradually to three and a half battalions; that the area held by me was long and broad, full of sedition, and that the force was inadequate for the work I was expected to perform with it.

The quality of the regular and auxiliary forces in respect of Shooting.—The Regular soldier, as well as the Volunteer, was a very good shot, as good as the average Boer, but when he got into the Field, the invisibility of the enemy, who was making himself unpleasantly felt, puzzled him. He was rather slow in getting his aim, and he found he was unaccustomed to use his rifle, without exposing himself, which at once brought a Mauser bullet in his direction. The Boer, on the contrary, was particularly good at shooting from cover, at getting his bead on to the enemy's hat or mess-tin quickly, and in getting covered again before our men could aim and fire. Other reasons for want of accuracy in our men's fire was too great hurry in getting off their shots, and in being trained, by so much collective practice, to fire at positions rather than at individuals (or whatever there was to be seen of them). This requires careful correction. On several occasions I saw our men wasting their ammunition at purposely prepared vacant trenches on kopjes, when the men who were doing the mischief were under cover in front or

to a flank. The Colonials used to say that black powder was purposely used by the Boers to attract attention to one part of a position, while smokeless powder was being used with effect by the rest, from trenches some distance away.

The shooting of the Militia from all accounts was not good, but a great number of men had never fired a course, and those who had had not benefited much by it, as the time at disposal during annual embodiment is too limited. A large proportion of the Militia knew very little about the rifle and what it was capable of.

The whole question of the Militia training is difficult, on account of the short time available. The country naturally does not wish to keep these battalions embodied longer than necessary on account of the expense to the State and the loss of wages to the men. The only solution appears to be to put as much shooting and consequently as little drill into the time as possible and to endeavour by all means to make rifle shooting a national pastime amongst the classes from which the Army is recruited.

It is impossible to expect the Militia Recruits to become efficient shots if their rifle training is to be hurried through as it is now. One month is as long as men can be expected to serve without losing their employment, and increased pay for even another month, say, would not compensate men for the loss of their permanent employment.

Marching.—As soon as the men regained their condition from board-ship life their marching powers were good. It is merely a matter of time and practice and is not progressive year upon year as a result of route marching each winter season with a valise on.

On service practically a man never carries his kit; certainly never his valise, which is a most irksome and detested load, and which would after a long march unfit a man for fighting an active enemy. There is, therefore, no object in a soldier carrying his valise on route marching; its use on these occasions has lately been restricted to men over six months' service, but it should not, I think, be carried by any soldier.

Horsemanship and Horsemastership.—I had no regular Cavalry under my command, but I saw a good deal of Cavalry horsemastership in many ways; much training is required to teach a man to be in sympathy with his horse.

The interest taken by Mounted Infantry in their work, riding, and their horses was remarkable. The men took to riding and made great progress in a very short time; of course much depended on the officer in charge.

Taking it all round, horsemastership was fair, but general result was bad owing to the fact that remounts

were landed in unfit condition after a long voyage, and had no chance of recuperating or getting into work gradually. This state of things was increased by the poor quality of the make-shift saddlery purchased for the Mounted Infantry and Colonials.

Entrenchment and Cover.—The men showed a keen aptitude and much ingenuity in making places strong. They worked willingly and patiently, but they had much to learn from the Boers, who were first-rate in planning and executing shelters and entrenchments in the most disguised and clever fashion.

For instance, trenches made by the Boers were seldom continuous, never finished with artificial or obtrusive lines about them; they were placed in any good position on the line of defence, on the hill, half-way down or at the foot, sometimes all three, where the command gave a chance of using them; sometimes the upper one well in view, was made unmistakably a trench, to draw the fire of guns and infantry, while the trenches below were occupied by men waiting their opportunity, when the attack got within certain distance.

The trenches were generally deep ones, wider at the bottom than at top, and gave good protection against shell-fire—if possible one end of the trench would open out into a donga to allow occupants to move to front or rear without exposure.

General Physique, Morale, and Intelligence.—The first troops, those I saw, belonging to First, Second, Third Divisions were composed of very fine material; there were many reservists in the ranks; the men were closely medically inspected, and there was plenty of choice; later, when more divisions were sent out, much younger material was met with, both in Regulars and Militia. The younger men wasted more than the older.

As might be expected in a protracted war of this kind, the privations and hard work found out many weak constitutions, but the sound ones became splendid men.

There were many cases in the South African War where the morale of the troops could not be surpassed, and there were cases where this was not so.

The men generally worked intelligently, and this was particularly marked in the Mounted Infantry, possibly because they were so constantly on the move and in touch with the enemy.

Deductions.—What we require at home are liberal manœuvring areas in each command, convenient to the troops, either acquired as a permanency or taken up under the Manœuvres Act of 1897. Government should secure manœuvring rights over a quarter of a county each year, or such less space as may be needed, to enable real value to be got out of the training and appliances given to the Army.

Tents are expensive to keep up, but outlay on them avoids the purchase of land and the erection of barracks on ground which is wanted for manœuvring and not for residence.

Difficulty in Finding the Enemy.—Owing to atmosphere, novelty, what not, this was very great. The necessary training to effect this must be very thorough, men's eyes must be trained to search for any strange object on the landscape or immediate surroundings, anything unusual, that should not be there, and men must constantly be practised at this kind of exercise; equally must they be taught how clearly to convey to others what they have seen and its exact position on the landscape.

Rushes in the Attack.—These must be sudden, short, rapid and irregular in interval and strength, otherwise the defenders get many chances; each rush must be locally supported by comrades' fire till the runners have settled down ready to support the next group in turn.

It seems impossible in the future to contemplate attacking by masses or in close formation of any kind. Regimental training must be constant practice over ground which permits of incorporating musketry with tactical exercises.

The mounted Boer is an adept at moving under fire from one position to another, dribbling three or four men at a time at a canter at very open intervals from behind one kopje to the next; the gunner found it difficult to get his range, as after one lot had gained the shelter, the next would canter 100 yards to the front

or 100 yards to the rear before branching off for the shelter. I saw this on several occasions.

Open Order.—The open nature of the South African country facilitates open order movements, and we found that the best order of advance was open column, company following company, men well extended to six or seven paces, often more, in single rank, with a distance of 150 to 200 between companies, the rear companies closing up when shelter was reached.

When the attack gained the dangerous zone, say half a mile from the position, unless the ground favoured the attacker, it was necessary to extend the files to a much greater distance, say 10 to 20 paces, and advance very slowly, men rising and spurting 25 yards to get to the next cover, while fire was kept up by groups whose turn it was to run next. No regular method can be laid down for this; it depends not so much on the officer or non-commissioned officer in the immediate vicinity as on the initiative of the best non-commissioned officers and men who become local leaders.

Owing to the noise of firing and the extreme extension, officers commanding units no longer control the advance by word of command, but their presence in the line helps to keep the movement in the right direction. It is difficult to keep the men moving under a heavy fire when cover is available. Education of the soldier to a high sense of national honour and responsibility must be a prominent feature in his training from his earliest school days.

Cavalry will more than ever be necessary for the fight of the future, but their rôle will be more that of Mounted Infantry than of Cavalry as at present one interprets the term. For turning movements, prolonging attacks and positions rapidly, for rear guards and pursuits they must be available. Care for their horses must be constantly impressed on them, and as carefully watched. Knowledge of how to save horses comes with experience; it cannot be taught in a year or two.

In any ordinary profession, if a man wishes to get on, he must devote the whole of his time to his business. In the Army this has not always been so, and it has rather been the fashion to consider that all work should be done in the morning, leaving the afternoon free.

The numbers and quality of horses.—During the first four months, the number of horses and mules was very inadequate, and as the bulk of the horses were newly landed and driven up country at once, without any proper feeding arrangements, a great proportion were in such an emaciated state by the time they arrived at their destination that they were worn out in a single day's work.

At Springfontein I saw hundreds pass through in this condition. Mules being much harder did not suffer in the same way; some batches under good horsemasters were quite a different thing.

A great deal of rubbish in the shape of horses came from all sources; the cause of this has been ventilated in the Press.

Some Argentines were excellent, hardy and strong and kept condition well, others, badly bought, were worth nothing. The omnibus horses sent for the Artillery were magnificent.

American horses, where properly selected, especially those bought out of work, were good, but those just caught had little chance of getting into condition.

The effectiveness of the guns, rifles, and other armaments used.—The field gun with spade attachment I thought did very well when pitted against field guns; in many cases it was condemned as useless by those who lost sight of the fact that it was only a field gun.

When the Boers used these guns they gained enormous range, 5,000 to 6,000 yards by abnormally elevating muzzle, but these shells did no harm.

Lyddite in its present form appears to be an over-rated explosive; results were said not to be commensurate with expenditure.

The Lee-Metford proved a good weapon; it is awkward and heavy to ride with, but any strong military rifle must be that. If a safe button pressing instead of trigger pulling rifle can be perfected, a vast improvement should follow in the shooting.

In selecting Staff Officers for Brigade and Division commands, there should always be one officer at least with previous war experience amongst them.

Major-General
Sir W. F.
Gatacre,
K.C.B., D.S.O.

25 Feb. 1903.

Major-General
Sir W. F.
Gatacre,
K.C.B., D.S.O.
25 Feb. 1903.

16773. On the question which we first raise, which bears upon what you have just been saying, your opinion is that you never had at any time an adequate force?—No, I had not sufficient troops at any time.

16774. You had not an adequate force for the purpose required?—No, it was quite inadequate for the purpose; the tract of country was very large and broad, and communication very difficult.

16775. You began, as you said, with the one battalion?—Yes.

16776. And afterwards you were reinforced?—Yes, afterwards I was strengthened gradually up to three and a half battalions, practically one brigade, and until within a few days of my being sent home, that was the amount of Infantry I had. Of course, I had miscellaneous troops that came in and trained and went away again, but I had no complete division.

16777. Was that chiefly Infantry?—It was three and a half battalions of Infantry.

16778. Had you any other troops?—I had a brigade division of Artillery which came to me, and I trained them, and then they were called away to join Lord Roberts' force; and I had another brigade division, which had a difficulty about horses, which remained with me, but, I had only a few mounted troops available. My mounted Infantry that I trained were called away as fast as they were trained, and in South Africa it is impossible to do without mounted troops. I am aware that they were very much wanted both on the right and left of me.

16779. But, still, their being taken away increased your difficulties?—Very much, because the line of country that I had to defend was the Stormberg range, running east and west from my line of advance. There was no lateral rail available, and Infantry could not get quickly from pass to pass if required to reinforce in South Africa. There were four principal passes, approximately 17 or 18 miles apart, which had to be held by Infantry, and it was quite impossible to make any movement from them, because I had not the necessary number of mounted men. That added to my difficulties very much. I was aware at the time that I went to Stormberg that I had too small a force, but at the same time I was repeatedly asked from Cape Town whether I could not make an advance on Stormberg; whether it would not be good business to make a night attack at Stormberg. When one gets suggestions from the Commander-in-Chief one tries to act up to them.

16780. You never had any Cavalry?—I never had any regular Cavalry. I raised Brabant's Horse, but they were made independent of me on the eastern line.

16781. They did not remain under your command?—No, not all the time. When the Stormberg affair took place, they were only equipping. One detachment was at Penhock, but it arrived too late at Stormberg to take part.

16782. Had you any Yeomanry?—No. I had no Yeomanry. Of mounted Infantry I got four companies from England, and they were sent away to the Modder River to join Lord Roberts; some of my other mounted Infantry that I trained were drawn away to Bloemfontein to join Lord Roberts' force.

16783. When you say you trained them, were they part of the battalions under your command?—They were taken from my Infantry. I took company after company from each Infantry regiment, and as fast as that was trained and taken away I raised another company; but there were great difficulties about saddlery, equipment, rope, and so on, which made training slow.

16784. Then that depleted the battalions, did it not?—Yes, that, of course, reduced the strength of the battalions by 120 men each time.

16785. (Sir George Taubman-Goldie.) Now you are talking of a time subsequent to Stormberg, when you say they were all taken away and sent to Lord Roberts?—Yes, subsequent.

16786. But you say they were taken away and sent to Lord Roberts. That, of course, was later; that does not apply to the earlier period—your first difficulties?—In the case of the mounted Infantry, that was taken

to Lord Roberts' force west of me. That was subsequent, of course, to Stormberg, because he had not then come out. At Stormberg itself, I had too small a force altogether.

16787. That was the point I wanted to elicit?

16787. * (Chairman.) And in choosing the mounted Infantry from the battalions, did you take the best men of the battalions?—Yes, they were always the best men I consider who joined the mounted Infantry. We picked them for being sharp; not always for being riders, because we trained them to that, but they were the sharpest, quickest, and most keen to do anything.

16788. Is that not rather hard upon the Infantry?—I think it certainly weakens the Infantry battalions. A commanding officer rather dreads mounted Infantry being raised in that way, because he knows his best officers, non-commissioned officers, and men go into the mounted Infantry; they like it better, too, and so they are keen on it; there is always a rush of men to go into the mounted Infantry.

16789. What do you say as to that, as a system to be adopted for the future?—What I think about that is, that by degrees every man should be trained to be mounted Infantry, so that you would be able to take a company entire instead of picking the best from all the companies. The latter is the system we adopted. We took the best men from all the companies, men who were suitable, not too heavy, of course; but all the best men were, as a rule, taken. But if every man was trained an equal lot would be obtained, and the battalion would not be injured so much.

16790. Do you think it would be practicable in the training of the Infantry battalions in this country to train them all for mounted Infantry work?—Yes, certainly, if there is a tract of country to train them over, it would be quite easy, and it would be a very useful thing, I think.

16791. Is anything being done in that direction now?—Yes, at Aldershot they have a regular training school now. I do not know at this moment what the establishment is, because it varies. I think they have one battalion only there, made up of companies from different regiments. That was going on prior to the War, and has been going on for some time.

16792. But that is a system that you rather object to—taking away companies from a battalion?—Yes, if the best men are picked out of the whole Regiment to form one company of Mounted Infantry; but what I mean is that if successive companies are trained, all the men are gradually trained in the regiment; not necessarily going to Aldershot, but to any big centre, sending all the men of the regiment through a month or six weeks' course successively.

16793. (Sir George Taubman-Goldie.) Do you see any objection to maintaining a force of Mounted Infantry quite distinct from the battalions altogether?—The only difficulty I see about it is its expense, and that a force that was not elastic would be obtained, whereas if the regiment was put through training, company by company, there would always be a standing nucleus, and the men would take more readily to the duties.

16794. (Chairman.) As to shooting, you are satisfied with the regular soldier on the whole?—The shooting was good, but not quite quick enough. The British soldier shoots very well, but in the field he found himself handicapped because he was not accustomed to shoot as quickly as the Boers shoot, which can only come, of course, with actual practice.

16795. And you think the Boers purposely led people to shoot at unoccupied trenches?—I was often told so by the Colonials. Personally, I saw it on one occasion at a place called Luperberg; I saw our men firing at an unmistakable unoccupied trench, and I remember going round and pointing it out. I think there is no doubt that this trick was played.

16796. And the Boers even used black powder to attract them?—That I cannot say, but I certainly saw black powder used in one or two places where it was quite unnecessary, and the Colonials say they did it on purpose. Other people were asked, the police, and so on, and they said, "Well, the Boers are armed with all sorts of stuff, and they shoot what they have got.

A Colonial Boer from some out-away farm accustomed to shoot game, will have old stuff and will probably use blackpowder cartridges." I think that is not only quite possible, but very probable.

16797. I suppose most of their ammunition was smokeless?—Most of their ammunition was smokeless, and very good. At the same time we found all sorts of old-fashioned ammunition and bullets of every shape and size dropped about, which showed that they had some old-fashioned ammunition.

16798. Had you Militia with you too?—The only Militia I had with me were handed over to me about four days before I was sent home. I saw a good number of them passing through.

16799. But you did not see them shooting?—No, I did not see them shooting.

16800. So that when you say that their shooting was not good that is from the accounts of other people?—Yes. One knows from what one sees at home when they are shooting that they are too hurried at it.

16801. They have not time for training?—No, it is impossible to do a lot of shooting in one month and train men as well.

16802. What would you suggest in order to make the Militia training more effective?—It is a difficult question, unless they are up for a longer time, when more practice could be given them. I think the solution is to get shooting somehow or other to become a national pastime, so that they may practise in rifle clubs at home. I think rifle clubs are excellent; but then they want prizes to shoot for, or else men will not spend their money on it.

16803. The marching was good, you say?—The marching was good.

16804. But you think the soldier had too much to carry?—That depended upon what was put upon him. What I meant was that at home it is the order that route marching must be carried out with the valise on. The valise is never carried on service, and I think as they are all young men, growing, improving, and altering every day, the fact of a man training in cold weather with a valise on his back does not help him in any way, and the weight may injure him. I think route marching is excellent, but I do not see any point about carrying the valise at home.

16805. But on service he would have to carry it, would he not?—No, he never carries the valise on service; practically his kit is always carried for him. It comes to that.

16806. And you found the men took to the necessity of getting cover, and so on?—Yes, they took to it very readily; but all that depends upon the men's training, and if there is not ground to train upon a man cannot be taught all those things. Manœuvring ground is the most crying want at this present time. We are very short of manœuvring ground.

16807. But the men were sufficiently intelligent to take up the work?—Yes, the men were quite intelligent enough.

16808. And you were satisfied with the men both in physique and morale as well as in intelligence?—Yes, the first lot. Subsequently in the Militia, and in the Regulars, too, the men who came out were not as good stuff as those that came out first; they were much younger. When the first three Divisions went out there were plenty of men anxious to go, and there were a great number of Reservists taken. Subsequently the Reservists got used up, as it were—they were all out, and a great number of very young men were in the ranks.

16809. But the Reservists did well?—Very well; they were splendid men.

16810. There was no difficulty owing to there being a large proportion of Reservists in the battalions?—I never found any difficulty from it.

16811. Unless you have the manœuvres of which you have been speaking, it is not easy to train the men to judge distance and to take up objects at a distance, is it?—No, it is difficult, because the men have not been accustomed to it, and they do not understand what is wanted. If there is good ground and varied ground

men can be shown exactly what would happen on the battlefield; but if there is only a small piece of ground that they know, plain ground with no cover, and so on, it is almost impossible to make the men understand what is wanted of them. Practice over rough ground is the only thing that will ever teach men what is wanted of them.

16812. And in the same way it is difficult to teach them the proper modes of attack?—Yes, the same thing applies there.

16813. You say in your *précis* that the attack now ought to be in rushes?—Yes, that has always held good. The advance must be quick and sudden, but it is more than ever the case now when fire is so rapid with the magazine rifle, and when the enemy cannot be seen owing to the invisibility of the smokeless powder.

16814. But the nature of the country in South Africa lent itself to open order movements?—Yes, it was a wild country, a very beautiful training ground; there was every sort and form of ground—cover and bare land between the cover, and all that could be required.

16815. But, however much you might train the men, a good deal at the moment would have to depend upon the initiative of the officer or non-commissioned officer, would it not?—Yes, that is so; it is the man on the spot who takes the initiative, who takes the others with him. The officer commanding a battalion, for instance, will have no more power over the battalion than a man who is not there; practically when the battalion is extended he can only actually influence the few men who are in his immediate vicinity.

16816. And even the company officer?—The same applies to the company officer because the men are spread out to 10, 15, 20 paces, and as they are all in a single line 150 men cover a large front.

16817. Then to whom must you look in the future; is it the non-commissioned officer or the individual soldier?—To the officer, non-commissioned officer, and men. The non-commissioned officer will, of course, influence the men in his immediate vicinity, but the class of man we require must be educated to a full sense of his responsibilities, if we ever arrive at that.

16818. Do you mean that with the class of men that we now get you can educate them up to that point?—There are always good men amongst them. There are, of course, a great number of men who are not capable of that. There must be some common class stupid men, but there will always be a good number of very good ones among them, very sharp and intelligent men. I think it is quite possible.

16819. It is quite possible, you think, to get a considerable proportion of the men trained to do this independent work?—Certainly.

16820. But it has been argued that if you had an army composed of more intelligent classes it would be sufficient to have a smaller army. What do you say to that?—I quite think it is a matter of quality and not quantity, especially in our own particular case. So far as one can see at present I should say it was quality that was wanted. We are very unlikely to attack any Continental Power—I mean to say our business is in India and South Africa; but we must have an expanding nucleus, and the more intelligent our men are and the more highly trained they are the better it would be, and if any big efforts are required of us we must do the same as we did during the South African War—we must increase our forces very largely—but we cannot expect to get trained men, though we should get very good ones no doubt. The country cannot keep up an army for a general purpose of that sort, I mean to say for the purpose of offence.

16821. But I understand what you have been saying just now to come to this, that even from the class from which we now recruit you get a very considerable proportion of men who can be trained to do what you want in the Infantry soldier of the present day?—Yes.

16822. We have had evidence from other witnesses that the soldiers improved wonderfully in that respect after being on service for a short time. Was that your experience?—Yes, they improved a great deal. The fact is that a man at home if he wants dinner goes

Major-General

and takes it from the cook-house. If he is in the field he has to cook it himself, and it sharpens him up. And in the same way if he wants to put a new helve into his axe he goes to the store at once and demands one, and gets one. In the field he has to go and cut a piece of wood that will fit the axe; he is taught that on service he learns his needs and how to meet them.

16823. As to mounted men, you have told us that you had not many with you, but you think that more care of their horses is very necessary?—Yes. The care of horses is, of course, a thing that comes by experience and by very careful training, and I think there is a good deal that needs to be continuously taught.

16824. And a good deal of the waste in horses arose from insufficient care being taken?—From insufficient knowledge, I think, insufficient care you may say. But of course in a great measure that waste of horses was caused by the urgency of the case, so that they were used before they were ready to be used.

16825. (*Sir John Jackson.*) That was from travelling by sea. I take it they are much the same as a man. If you are laid up in bed for a fortnight with a sprained ankle you can hardly move on your leg when you get up. Does not the same apply to horses travelling by sea? If they have had no hard exercise for two or three weeks, for a few days they are not at all fit for work?—It depends upon what sort of voyage they have. If they have a rough voyage they will want a fortnight or three weeks to get them fit to commence conditioning them but it takes longer than that to get them in their full condition; and if they have a bad voyage they become emaciated and are not fit to work for a long time. Many of these horses were landed one day and moved off the next.

16826. And they get no exercise in the ordinary sense at sea?—No, what they want of course, is slow exercise daily.

16827. (*Chairman.*) Did you see the horses going up country?—Yes, a great number passed through Springfontein.

16828. You mentioned some of the Argentines as being good?—Yes the Argentines generally were condemned out there, but some batches, the first batch for instance that I saw, were excellent, they could not be better for Mounted Infantry; a short, stout, cobby sort of horse with great power, which would live upon anything; but of those that came out afterwards that I saw, a great number were worthless.

16829. (*Sir George Taubman-Goldie.*) Can you remember whether the Argentines you saw first were those bought in 1898 or those bought later?—I should say in 1898, because they had been with the Berkshire Mounted Infantry roughly a year; but they were very good, they were the best class of horse from the Argentine.

16830. (*Chairman.*) As to guns; you thought well of the field gun?—I thought well of the field gun. I think it did its work very well, but it was so often pitted against a better class of gun, a newer class of gun with a heavier calibre, that it could not play its part.

16831. But you say that when the Boers used those guns for very long ranges the shells did not do any harm?—They used to elevate the muzzle considerably; the shell would come down and there was an end of it. But the moral effect at first was great, and they could get a couple of thousand or fifteen hundred yards out of them more than we could. But in the one case the shell was effective, and in the other it was not, although it looked the same when it dropped.

16832. Was that shrapnel?—Yes.

16833. You think the effect of firing at long range is a good deal a question of moral effect?—Yes.

16834. Those long range guns do not do so much material damage?—If a gun is used at much over its effective range, then, of course, the shells become ineffective.

16835. With regard to the lyddite, you did not form a very high opinion of it?—I never saw it used, but from all I heard its effect was not very great.

16836. Then the rifle, the Lee-Metford, do you approve of that?—Yes, it shot very well.

16837. What do you mean by a button-pressing instead of a trigger-pulling rifle?—Instead of pulling the trigger there is a button to press. There is one under trial I believe. The advantage is that it is necessary to press steadily. If there is a trigger, and a man is jumpy or young, he pulls to get the thing off; but he cannot do that with the button, he must press.

16838. Is it not rather a dangerous thing?—I refer to a safe one; it must be a safe one. It wants, like all these things, working out, and there must be something that will render it safe.

16839. As to Staff Officers were you satisfied with the staff that were provided for your Division?—I took over the staff that was handed to me. There was no officer of any war experience on my staff: that handicaps a General Officer.

16840. Were they Staff College Officers?—Yes.

16841. But they had not had any actual service?—No, they had had no war experience.

16842. Do you prefer an officer for your staff who has had staff college training?—I should always be inclined to take one. If two officers are put in the field, one of whom has had it and the other has not, I should take the officer who had had it, unless I knew the two men, and knew that the other was the better man. Going to the Staff College does not, of course, make a man able or a good staff officer, but it ensures a certain amount of military training and staff training which is always an advantage.

16843. We explained in our memorandum the position which we take up with regard to any reference to matters of controversy, either strategy, tactics, or otherwise. I will only ask you if there is any incident in connection with the operations in which you were engaged as to which you wish to make any statement to us. If you say there is nothing you wish personally to allude to or which you think it is in the public interest you should allude to, that is of course sufficient for us?—I should merely like to say with regard to both Stormberg and Reddersberg, the two affairs for which I got censured and sent home, that on neither occasion had I an adequate force for the work in hand, and that with regard to Reddersberg, the three companies of Infantry that were sent to Dewetsdorp were sent on a telegram from headquarters at a time when everything was going well, but that on the day when they arrived at Dewetsdorp everything in front went wrong Lord Roberts had about 30,000 men at Bloemfontein at the time; there was a Cavalry Brigade and a Division of Infantry of General Colville's at Thabanchu and on the Modder River respectively; and my small post that was sent out to hold Dewetsdorp was in their rear, about 80 miles to my front. General Broadwood's Brigade met with a disaster at Sanna's Post and General Colville's Division was withdrawn, leaving my three companies in the front line. Of course I was quite impossible for them to hold their own, but when they were sent there there were 30,000 men at Bloemfontein, and there was a Cavalry Brigade and an Infantry Division in their front as stated above. I never sent them there as an outpost, not expected them to act as such but merely to hold a post on an interior road.

16844. That is all you wish to say?—That is all.

16845. (*Sir John Hopkins.*) Had you any naval guns with you—12-pounders?—No, there was a small naval gun in Queenstown.

16846. (*Sir George Taubman-Goldie.*) You were speaking about manœuvring ground for the troops; have you served in Ireland?—No, I have never served in Ireland.

16847. You could not say whether it would be a suitable place for keeping an extra Army Corps in order to give them plenty of manœuvring?—I do not know the country well enough.

16848. Then another point that you mentioned was the initiative required for subalterns and non-commissioned officers. That can only be obtained in war by giving them plenty of freedom in peace?—Yes, in manœuvring troops.

16849. And also freedom from superior authority in action during the manœuvring?—Yes.

16850. Is that being carried out at Colchester at all; has any change taken place since the War under your command in the direction of giving more freedom to the subalterns?—I always endeavour to help them in that way, and the way one does it is by placing subalterns in command of companies at the company training. I always do that.

16851. And you impress that upon colonels of battalions and so on?—Yes, make them the umpires, so that the subalterns and junior officers (who are generally commanding companies) really have individual responsibility.

16852. And should you say that that is now being carried on to an extent that is was not carried on before the War?—Much more so.

16853. Much more so?—I think recently both in the Cavalry and Infantry, and it is a practice that one wants to increase.

16854. You are in command of a Division, are you not?—Yes.

16855. I ask you because, of course, it is to those in command like you that the country looks to see that the question of the initiative of the younger officers is being attended to?—I am always very strong on that point. When I am out I am always watching to see that the subalterns are employed in that way and given a free hand. The most valuable part of the training is the company training under the supervision of the Commanding Officer of the regiment when two or three companies are employed on the one side against two or three on the other.

16856. And besides that it is essential, I suppose, that they should not be too severely taken to task if they fail, or they will not assume responsibility afterwards?—Just so.

16857. Should you say that was generally understood throughout your Division?—I think it is, much more so than it used to be, anyhow. There has been a distinct increase in it.

16858. Just one other point. You were speaking of the difficulty of getting the Militia to shoot sufficiently well and to perform military duties sufficiently well with so short a training. The same objection has been raised with regard to the Volunteers owing to the small number of days that they train; and the same applies also to the Yeomanry?—Yes.

16859. Let us assume for a moment that the country submitted to have universal military training for boys of 18 for six months; would that be sufficient time in which to give a general military training for those who afterwards entered the Militia, Yeomanry, and Volunteers?—I think so, if the shooting is made enough of. Every man would get an idea of what he might have to do on emergency; I think it would be quite sufficient if the shooting was made a strong point and encouraged in every sort of way; not pot-hunting but village rifle shooting.

16860. And I suppose six months' military training would teach a young man of that age a great deal?—It would teach him a great deal.

16861. We have had evidence from high authority that if he was intelligent it would make him into a good Infantry soldier?—Yes, I think so, because we do not want, after all, to make the man a barrack yard soldier, but to make him a sharp fighting machine, who will do anything he is told, or, if he is not told, will take it upon himself to do the right thing.

16862. Then, passing to the other case, in which you said that in the event of a great war we must necessarily rely upon obtaining Volunteers from this country (as we did in the South African War), you would then have an enormous reserve of partially-trained men to draw upon?—Yes, men who would soon come to hand.

16863. You would approve of such a system provided that the country would submit to it? Yes, I do not think there would be much difficulty about it, so far as conscription goes, if there was a system of insurance started. Nobody wants to be conscripted; then let everybody pay so much for not being conscripted, and insurance companies would insure men against being conscripted; that is to say, if a man

joined he would pay nothing, if he did not want to join the insurance companies would give him at the end of his three years' service or whatever it is—say, £200 or £300, or £400—and then all these young men would jump at military service because they would afterwards get a start in civil life.

16864. I want you to understand that I was not asking questions upon the subject of conscription for foreign service, but merely on the subject of universal military training for all the youth of the country?—Without the word conscription?

16865. Not only without the word, but without the fact. It would be, of course, compulsory if it was universal, but it would include the whole of the youth of the country?—Yes, it must only be for a short time, six months or something of that kind, or the prosperity of the country would be affected.

16866. (*Lord Strathcona and Mount Royal.*) I understood you to say that from the beginning, and throughout, you had not a sufficient force for the duties assigned to you?—I had not.

16867. Did you make any representation with regard to that fact?—I constantly asked for more troops, but I was told by General Buller that they were wanted, and as soon as they became available I should have them.

16868. You also said, I think, that you endeavoured to improve the condition of your force by forming Mounted Infantry—mounting a certain proportion of your Infantry?—Raising them, yes.

16869. And that immediately you had succeeded in raising them they were time after time taken from you?—Yes, they were drawn away.

16870. And you had to begin anew?—Yes, I had to begin anew.

16871. You chose the best of your men necessarily for this work?—Yes.

16872. So that your force was really depleted of those who for the work to be done would have been the most useful?—Yes.

16873. Did you complain of that also?—No, I never complain. I went on raising these men. I thought the more men we could raise, the more likelihood there was of keeping them. I was always in hopes that I might be able to stick to the men and they would become valuable to my force.

16874. Is it a usual thing in the field to take away men from a regiment in that way?—That is the only way they can be taken. There are no other men to draw upon under the present system, because we have never had any force of Mounted Infantry before this war; we have practically never had any big force of the kind. There have always been a certain number of men who have been trained at Aldershot.

16875. You state in your *précis* that the Colonials used to say that black powder was purposely used by the Boers to attract attention, and so on. Had the Colonials any better means than the others of ascertaining what the Boers were about?—They all spoke the language.

16876. (*Chairman.*) You mean the South African Colonials?—Yes.

16877. (*Lord Strathcona and Mount Royal.*) The local Colonials?—Yes. I had none of the others.

16878. So that, of course, they knew more of the country and more of the Boers?—Yes.

16879. You say that the soldier when at home, if an axe handle is broken, gets another from the stores?—Practically, yes.

16880. But he has to make one if he is in the field?—Yes, it often happens so.

16881. He has to get a piece of wood for it and make it himself?—Yes.

16882. Did you find that the Colonials (you say you had only those from South Africa) were more expert, more adroit, in this work than the ordinary soldier?—They knew a good deal more.

16883. They were handy men, so to say?—Yes, it is their life, of course. They were farmers, and if they

could not make one they would get one. Our soldier, of course, is told never to take anything that is not his own. With the Colonial it is rather the other way—always to take somebody else's rather than his own, if he wants it.

16884. And that is a great advantage in the field—to be able to replace anything of that kind?—Yes.

16885. You said also (and that we have heard from others) that often the horses on being landed from the steamers were in a very bad condition?—Yes.

16886. They were entirely unfit for work for some time?—Yes.

16887. Do you know anything of the provision made on board ship for keeping the horses in as good condition as possible throughout the voyage; whether everything was done that you think ought to have been done for that purpose?—I think on most of the ships it was, but sometimes they had a bad voyage; and when horses are crowded together and are down below, a thousand on a ship, there is very little fresh air, and that deteriorates the horse more than anything, overcrowding, difficulty of feeding, difficulty of watering. When there are 100 horses in row after row it is very difficult sometimes to get to the horses and ensure that all get their food. It is supposed to be done, but there is a difficulty about it, naturally.

16888. I think we have had evidence that in some cases they were able to exercise the horses to a certain extent every day, taking a few at one time, and others at another time, and so on—in fact that they were able to move them about?—That is so, but it is a difficulty, and if there is any question of weather, the captain will not have a horse out at all; a loose horse on deck is rather an awkward business—sailors do not want it.

16889. There is a very great advantage when they are able to do so?—Yes, but when there are a thousand horses it is not possible to do much. Some horses can be brought up in that way; our battery horses were brought up in that way, because the battery officers and men knew every horse and they brought them up; but when there are a thousand wild, half broken horses, that cannot be done. The theory is good, but in practice it cannot be done.

16890. When the Yeomanry or Militia are brought out for training annually, do you think it would be better that they should have their camps in different parts of the country, and on ground of different character? For instance, I believe it is usual to have the camp in the same place year after year, is it not?—The Manœuvres Act of 1897 or 1895, I think it is, anticipates hiring fresh ground forcibly year after year. That will be a very unpopular measure, because it destroys the game, but the principle is good. It is no use taking up a piece of ground full of fences, ditches, and dykes, which men cannot move across. So that it practically comes to this, that sooner or later the best piece of ground, heathery open ground, must be taken; fences and such things cannot be destroyed wholesale for the movement of troops.

16891. Training them for the field by observation of the ground?—Yes, getting good open rough ground and using it; taking it up for the year.

16892. (Sir John Edge.) The attack on Stormberg took place on the 10th December, 1899?—Yes.

16893. Did you give an explanation to Lord Roberts of what had taken place at Stormberg?—Yes, I was called upon for it when he first came out to take command; he asked for an explanation.

16894. That was when he came out first?—Yes, that was December or January. It was the beginning of January, I think.

16895. Did you subsequently see him in Bloemfontein?—Yes, it was in March when I saw him at Bloemfontein.

16896. Did he then propose to increase your command?—Yes.

16897. By how many regiments?—Ten battalions, for the purpose of covering his right flank during his advance.

16898. You had, I think, sent three companies to Dewetsdorp?—Three companies of Infantry and two Mounted Infantry companies.

16899. When was that?—That was on the 28th of March. Lord Roberts telegraphed to me at Springfontein: "If you have enough troops at your disposal I should wish you to occupy Dewetsdorp. Will make road from here to Maseru safe, preventing enemy's forces from using telegraph lines to the south. Let me know what you can do in this."

16900. On that did you send these three companies to Dewetsdorp?—On that I sent off the three companies and informed him at once.

16901. And the mounted men?—Yes.

16902. You sent them to Dewetsdorp?—Yes.

16903. And informed Lord Roberts?—Yes.

16904. At that time was your front covered?—My front was covered by Lord Roberts' troops, 90 to 100 miles ahead of me. I was 90 miles south of Bloemfontein.

16905. But had you any troops nearer than that on your front?—No, all my troops were alongside of me, practically on both sides of the rail parallel with Springfontein—Bloemfontein Railway.

16906. And were there any other troops between you and Lord Roberts?—Just small detachments guarding the connecting line of rail between Springfontein and Bloemfontein.

16907. Did anything occur to make the post at Dewetsdorp more exposed than when you sent the men there?—General Broadwood's Brigade withdrew from Thabanchu, and got into trouble at Sanna's Post, but that I did not hear about till too late to get my Dewetsdorp detachment back. General Colville's division was at the waterworks there, on the Modder River, but they were withdrawn, why I do not know. I believe there is a controversy about it.

16908. We need not go into that?—Anyhow they were withdrawn, and I never heard of either till I got an urgent telegram from Lord Roberts to say that it appeared that Dewetsdorp was too far advanced, and that I should withdraw to the railway line. On that, of course, I wired at once.

16909. You got that I suppose on the 31st of March; Lord Roberts wired to you on the 31st of March?—Yes.

16910. That Dewetsdorp was too far advanced?—Yes.

16911. What steps did you take then?—I sent a telegram to Wepener, which was acknowledged. I sent despatch riders direct from Springfontein (there were no other means) to this force, and got it acknowledged by Captain Casson, who was in command at Dewetsdorp.

16912. You sent despatch riders with orders for the force to withdraw?—To withdraw at once towards Reddersberg, towards the railway line. The Officer Commanding also sent a despatch out from Wepener to that effect.

12913. And it was on the retreat then from Dewetsdorp that this affair at Reddersberg happened?—Yes, they could not get back to the railway.

12914. Subsequently to that Lord Roberts removed you from your command?—Yes, on the 10th.

12915. And sent you back to England?—Yes.

12916. Now, I have to ask you, were you called upon for any explanation of that affair at Reddersberg, or of your sending the men to Dewetsdorp before you were removed from your command?—No. I merely received a telegram asking what steps I took on receipt of Lord Roberts' telegram of 28th March.

16917. (Chairman.) Is there anything else you would like to add?—No thank you.

(After a short Adjournment.)

Lieut.-General Sir THOMAS KELLY-KENNY, K.C.B., Adjutant-General, recalled and further examined.

(See Questions 4472 to 4963 Vol. 1, for Sir Thomas Kelly-Kenny's previous Evidence.)

16918. (Chairman.) When you were here before we postponed any examination or any statement which you might desire to make, based on your experience in South Africa; have you some statement which you would wish to put before us now?—I have no desire to make any statement. The Secretary to the Commission asked me to prepare a short statement of my experience in South Africa while I was in command of the advance, and I have prepared that statement. I understand the Commission wishes to have a short sketch of my movements from the 12th February till we arrived at Bloemfontein on the 14th March. The most concise manner in which I can lay this before you is in the form of two of my despatches, and the first was to Lord Roberts from Modder River, near Osfontein, February 20th, 1900:—“My Lord, I have the honour to lay before your lordship a short resumé of the operations of the troops under my command from the morning of the 12th February, when we marched from Enslin on the line of the railway until the morning of the 19th, when your lordship arrived on the field and assumed command of the troops then engaged with the enemy. On the 12th the 6th Division with troops attached marched to Ramdam. At dawn on the 13th the march was continued, until we struck the River Reit at Watervaal Drift. This was a very trying march, owing to the heat and dust. On the 14th, leaving Watervaal at one a.m., we marched down the Reit to Wegdrei, arriving there about 10 a.m. Here we halted for some hours. Outposts were immediately thrown out of the mounted infantry and the infantry. Jacobsdal was temporarily occupied by the mounted infantry without opposition. The small party which occupied it having been withdrawn, the enemy, who hitherto had not been visible, opened fire on the mounted infantry outposts. The outposts were strengthened by the infantry, and a battery was pushed forward, but the enemy presented no target. This day was a trying one, owing to the night march, and also the minor operations connected with the enemy's move from Jacobsdal, and the men under ordinary circumstances deserved a night's rest. When I became aware early in the afternoon that your plans required an extra effort to enable General French's division to march on Kimberley, I directed the troops to march again at 5 p.m. across the veldt, making a night march so as to strike the Modder at Klip Drift in the morning. All ranks responded to this call. We left the Reit at about 5.30 and reached Klip Drift about one a.m. on the 15th. After some hours rest the division crossed the Modder and relieved General French's outpost. I was able to cover General French's march with my Artillery, including the two Naval 12-pounders. Our fire drew the enemy from General French, when he proceeded on his march. During the remainder of the morning our guns were turned on the enemy's laager, and on those retiring from General French's left flank. On the 16th the whole of the troops under my command, except those occupied in the outpost line, were disposed so as to enable a large force of mounted infantry to follow General French. The troops were paraded at dawn and marched into their positions. About 6 a.m. we saw in the distance, passing from west to east, a very large convoy. It was Cronje moving from Magersfontein. I gave directions to attack it and harass it. As we were rather behind it we could not hope to capture it. Realising the importance of doing everything possible to harass this convoy, I directed that the movement to Adam's Dam following General French was to be abandoned, and all efforts brought to bear on the convoy. The Mounted Infantry and Artillery and General Knox's Infantry Brigade was engaged all day from dawn to dusk in a rearguard action. We did a considerable amount of damage, both to the convoy and the laager. Our losses were about 100. The enemy suffered severely. It is impossible to state his loss accurately. On his evacuating his laager, our people endeavoured to collect his wounded into it. Notwithstanding the efforts made on the 16th the troops again marched at three a.m. on the 17th from Klip Drift on Klip Kraal, where we rested a few hours, and reached Bomvall Drift about two p.m. the same day without opposition. At 5.30 p.m. we again marched towards

Paardeberg, and reached its vicinity about nine p.m. On the 18th we marched at three a.m., and came into touch with the enemy between six and seven a.m. He was strongly posted along the banks of the Modder. His laager was on the north bank. The Artillery kept up a heavy fire all day, destroying the laager and blowing up the enemy's magazines. The Infantry was gradually brought into action, General Knox's brigade holding the enemy entertained. Colonel Stevenson pushed on his left flank over and along the river banks. Early in the action I was informed that General Colville was moving up on the left. I sent back to him to move one brigade on the left and one on the right bank with a howitzer battery and a field battery. The battle continued all day, the troops pressing the attack on the flanks but meeting with considerable opposition. The enemy held such a strong position on the north bank, the river being in flood, that I decided not to assault in front. Part of General French's Cavalry from Kimberley co-operated from the hills on the north. Although at nightfall the enemy still held on to his entrenchments, he was completely hemmed in on all sides with his laager wagons and ammunition destroyed. I regret the losses, returns of which were sent to your lordship to-day as far as they could be ascertained. I believe that both General Knox's and General Macdonald's wounds are not very severe. I will take an opportunity of bringing to notice the special acts of devotion to duty on the part of individuals. I confine myself at present to representing to your lordship the fine spirit and gallantry of all the troops engaged. Major-General Lord Kitchener, G.C.B., Chief of the Staff was present all the time. In accordance with instructions conveyed to me in your note of the 17th I recognised his suggestions as conveying to me your lordship's orders, and acted thereon.” That was the despatch up to the 20th February. The other despatch I scarcely think I need trouble you with; that is the despatch after the battle of Driefontein. I will read it if you wish it or hand it in.

16919. Will you just hand it in?—It is as follows:—“Bloemfontein, March 15th, 1900. My Lord,—I have the honour now to amplify the short notes I gave you at your Lordship's headquarters on the morning of the 11th inst., describing the salient points in the engagement in the neighbourhood of Abraham's Kraal and Driepan of the previous day.

2. In accordance with instructions from Army Headquarters, the Division marched from its bivouac at 6 a.m. A Cavalry Brigade was some 5 miles in front.

3. The distance between our bivouac in the morning and Abraham's Kraal is about 9 miles. I proceeded with part of my staff in advance to reconnoitre and obtain from General French the result of the Cavalry reconnaissances. The division rested and breakfasted between 9.30 and 10.30 a.m.

4. Finding the enemy in force about Abraham's Kraal, with two guns on the extreme southern end of that position, I determined to bear away from the river as wide as possible—having in mind that my objective was Baberspan and to move forward between Abraham's Kraal and Driepan. I attach a sketch elucidating the description of the operations.

5. As my troops consisted only of Field Artillery and Infantry, the movements were naturally slow, and the enemy's tactical mobility admitted of his being able to throw his strength on my line of advance, while his long-range Creusot guns never ceased throughout the day to throw shells amongst my troops, and occasionally amongst the transport. I may here say that notwithstanding that my Field Artillery was outranged and unable to keep down the Boer fire, and the frequency and accuracy of the latter, comparatively little loss was experienced thereby, as the shells generally failed to burst.

6. Finding the Boers in strength in my front, I contented myself for a considerable part of the day with containing him, and arranged with General French that the mounted troops were to move still further to the right against the enemy's flank or rear, and thus

Lieut.
General Sir
Thomas
Kelly-Kenny.
K.C.B.

25 Feb. 1903.

take off the pressure from my front. General French and I were in accord as to the soundness of this movement, and I anxiously awaited its development.

7. The day was passing away, and by bearing in mind that, whether the division was to reach its camp that day or bivouac in its present position, it was impossible to allow the enemy to occupy the commanding hills in our front, I decided that even without the assistance of the mounted troops I would force the enemy's line.

8. As the trains were large, and exposed to an enterprise from the river side, it was necessary to secure them by a strong rear guard. I left the command of this rear guard to General Knox, with two battalions and one Field Battery, so that when our forward movement in the afternoon commenced I had at my disposal only two Field Batteries and five battalions, viz., the 2nd Battalion the Buffs, the 1st Battalion Yorkshire, the 1st Battalion Essex, the 1st Welsh, and the 2nd Battalion the Gloucester regiments.

9. I kept the Buffs and Gloucester Battalions in reserve. The Welsh advanced in the centre, the Essex on the left, and the Yorkshire on the right, but rather back, as it was hoped that, failing the assistance of the mounted troops, we might operate with this battalion on the enemy's left flank. The line was very extended, particularly so on the right, as the troops were kept on the high ground as much as possible, and did not move along the valleys between. The reserve was in rear of the centre.

10. At first the troops made some advance, but the enemy's fire prevented anything like a general forward movement. The Welsh Regiment was the first to make ground decisively, but under a heavy fire, so much so that from the Reserve I ordered up the Buffs at once, and later two companies of the Gloucester Regiment.

The Buffs came very quickly into line, and assisted the Welsh Regiment to establish its position. I may here say the two batteries of Field Artillery much contributed to admit of this movement of the Welsh and Buffs. I now drew in the Yorkshire Regiment to its left, and despatched it to operate against the enemy's left flank.

11. The engagement was now in full force, and little progress could be made owing to the stubborn resistance of the enemy. I therefore drew in the Essex to its right, its direction being to the left and rather to the front of the Welsh. The Essex now charged the enemy's right flank with fixed bayonets with such dash and determination that the Boers gave way, and a general advance taking place the whole of the Boer line gradually joined in the retreat. Our troops pressed forward, but it was too late to make our camp at Baberspan, so we had to content ourselves with long-range volley firing at the retreating enemy and the occupation of the ground hitherto held by him.

12. On the conclusion of the engagement I rode to your Lordship's headquarters and received your orders for the occupation of the ground during the night, and for the further advance on the morning of the 11th.

I regret the losses which this engagement entailed on my division; they are as follows:—

	OFFICERS.			RANK AND FILE.			
	Killed.	Wounded.	Died of Wounds.	Killed.	Wounded.	Died of Wounds.	Missing.

Totals	4	13	2	51	321	1	26
TOTAL Casualties				421			

13. I particularly regret the death of Lieut. Parsons of the Essex Regiment. I had already brought his gallantry to your Lordship's notice, and recommended him for the Victoria Cross for his courageous actions on the 18th February at the battle of Paardeberg. Colonel Umphelby, of the Australian Artillery, I regret to say, died of his wounds; he acted during the operations since the 14th February as a galloper, taking my orders

to the Artillery; he was a general favourite with all his comrades in the Army. Captain Lomax, Welsh Regiment, is also a great loss to his regiment.

14. It is difficult to say with accuracy the strength of the enemy, but I judge, from all indications and observations on the 10th, and from reliable intelligence since obtained, that it was over 6,000 with four guns. The retreat was apparently on Bloemfontein, and north.

of it. The losses of the Boers were very heavy, 102 dead bodies were found besides those carried away. I believe that at least 60 bodies were so carried off; the number of wounded I estimate at 400. We made some prisoners, sent to your Lordship's headquarters.

15. It remains for me to bring to notice some names of those in the 18th Brigade who were conspicuous in the engagement. I do so, as this Brigade is about to be transferred to another command to make room for the 12th Brigade under General Clements, which originally formed part of the 6th Division.

With regard to the names of those of the 13th Brigade and other troops permanently belonging to the 6th Division, in accordance with Circular Memo. No. 1, of 6th March, 1900, I have made a note thereof to be submitted at the conclusion of the campaign.

Brigadier General Stephenson in this action, as on every occasion in which he has been engaged, was cool and sensible, and his leading inspired confidence in all ranks. He was ably assisted by his Staff, Captain Couper, B.M., and Lieut. Howard, Essex Regiment, A.D.C.

Lieut.-Colonel Giffard, of the Welsh, commanded this Battalion throughout the day with judgment. He never failed to take advantage of any opportunity the enemy gave him during the advance. Major Fearon on this occasion, as on others, particularly at Kitchener's Hill on the 23rd February, showed military skill and judgment.

Major Brown commanded the Essex Regiment. I was quite satisfied with the manner in which he exercised his command.

The undermentioned have been brought to notice by Brigadier General Stephenson and the Commanding Officer of the battalions concerned."

The next point is the question of the command at Paardeberg. I had no intention of re-opening this matter, but I assume you wish to ask questions about it. Your questions and Lord Roberts' evidence which you sent to me, remove to some extent the reserve I hoped I might be able to maintain with regard to it. I say "to some extent," because I volunteer nothing in the way of evidence. I have no complaint to make or grievance to air, but incidents and discussions, mostly of a confidential nature, were inseparable from operations such as those I was associated with.

16920. Certainly. We thought it right to give you an opportunity of seeing what Lord Roberts said?—To make the question of the command at Paardeberg clear I am afraid I must retrace my steps to February 13th, 1900. The whole of the afternoon of that day (my march from Ramdam having been accomplished in the morning and forenoon) I was occupied in getting my own division over the Watervaal Drift and in assisting the Cavalry trains over it. I completed the crossing about five in the afternoon. Later, Lord Roberts came from De Keil's Drift to my bivouac. I reported to him the result of the day's operations and the situation of my command, that is the Sixth Division. Lord Roberts desired me to make a night march on Wegdrei, where he said I would receive further orders. I understood him to say that he would join me there. I marched from my bivouac about 1 a.m. on the 14th February. At dawn, when halted to await the result of a staff officer's reconnaissance to the front, for the first time I discovered that Lord Kitchener was with the force. From that time Lord Kitchener accompanied the advance. I cannot say that our relations were quite satisfactory. I felt and I told him that I was in command and responsible. He admitted this without reserve. I never failed, however, to recognise Lord Kitchener's knowledge of the general situation and of the Commander-in-Chief's plans, and we were in constant consultation. Up to, however, the afternoon of the 17th February I had no doubt whatever about the command and the responsibility. No doubt you noticed the following sentence in my despatch of the 20th February describing the battle of Paardeberg: "Major-General Lord Kitchener, G.C.B., Chief of the Staff, was present all the time. In accordance with instructions conveyed to me in your note of the 17th I recognised his suggestions as conveying to me your Lordship's orders, and acted thereon." I put the position as delicately as I possibly could, in order not to rouse a controversy, as, of course, I knew my despatch would be published. Nevertheless, from the receipt of Lord Roberts' letter on the 17th I felt the situation was com-

pletely changed. I hand to the Chairman Lord Roberts' letter referred to; in fact, I had better read it.

16921. If you please?—"Jacobsdal, 17th February, 1900. My dear Kenny, I hope you are pushing on with all possible speed to overtake Cronje's laager. It is of the utmost importance it should not get away. The bullocks drawing his wagons cannot go as fast as our mules, nor so many consecutive days without breaking down. I hope to join you to-morrow. Meanwhile, please consider that Lord Kitchener is with you for the purpose of communicating to you my orders, so that there may be no delay such as reference to and fro would entail. If we can deal Cronje a heavy blow it is likely there will be no more fighting in the Orange Free State. Believe me, yours truly, Roberts." Although Lord Kitchener could carry out the Commander-in-Chief's directions, as stated in Lord Roberts' evidence, viz.: "You must go and join General Kelly-Kenny, and keep me informed of all you can hear from General French or whatever General Kelly-Kenny may decide to do as affairs turn out, and I shall be able to communicate with you as to what happens here," anything like orders was quite incompatible with my being in command, considering the distance, several marches separating Lord Roberts from me and the enemy I was pursuing. I was very much upset by this note, particularly so as up to the receipt of it the troops under my leading had done everything that soldiers could do, either in fighting or marching. I considered the note, although courteously worded, with one superseding me. I hand to the Chairman my reply; in fact, I had better read it.

16922. If you please?—"Bothaville Drift, 4 p.m., 17th February. Dear Lord Roberts, I telegraphed to you to-day how we are getting on. Nothing can exceed the marching and spirit of our people. Marching day and night; we made an eleven-mile march this morning. After a rest we start again at 5 o'clock, and again, as your plan has suggested, we march at 3 a.m. to-morrow; we will bivouac at Paardeberg, I hope, this afternoon. So far to-day there was little opposition. The wounded yesterday I under-estimated about a hundred. We are doing all we can to send them to Klip Drift camp. The Boers lost heavily yesterday. Reported 100 killed and 300 wounded. We are doing what we can to help them. You will get the Jacobsdal Hospital people to take them there. I am marching very soon, only awaiting report from the Mounted Infantry. With regard to my position and Lord Kitchener's, your description of it I perfectly understand. This is not a time to enter into personal matters. Till this phase of the operation is completed I will submit to even humiliation rather than raise any question connected with my command. We are doing well in regard to fresh meat, and this must be replenished soon. I believe a column is coming in. Artillery horses are very soft. I have one Navy gun, a 12-pounder.—Yours truly." That was my reply to Lord Roberts, and I gave it to the orderly who brought me his letter. I may say that although the receipt of the letter in due course could not have altered the decision, the orderly missed Lord Roberts, and in fact the letter I have just read was not delivered to him, but brought back to me the day after the battle of Paardeberg. In accordance with the line I had marked out I determined not to trouble Lord Roberts with this personal matter until the Cronje phase of the campaign was ended. On the 27th of February I accepted the surrender of 4,000 of Cronje's troops. I looked on this as the end of that phase of the campaign. I subsequently discussed the question of the embarrassing position I was placed in. I explained to Lord Roberts that the reply to his letter had missed him, and I read it to him. The Commander-in-Chief assured me that no such incident would again occur. I was perfectly satisfied, and I would not have originated this controversial discussion except in the circumstances already mentioned, that is Lord Roberts' evidence. I do not wish to leave the Commission under the impression that there is or ever has been any personal quarrel or ill-feeling between Lord Kitchener and myself; there never has been. I may mention that at Paardeberg he shared his luncheon with me, and we are the best of friends. Lord Roberts arrived at Paardeberg the day after the battle and assumed command. During the action at Poplar Grove my division, reinforced in Artillery to 40 guns and a large force of Mounted Infantry, made a flank attack. As Lord Roberts commanded the whole I made no special

report of that action, but I am willing to reply to any question the Commission puts to me. I did not include it in any of the despatches. I have handed in a copy of my despatch on the battle of Driefontein. Lord Roberts commanded the whole army during the remainder of the advance on Bloemfontein, and I have nothing further to say in reference to the advance. From the 3rd May I was in command at Bloemfontein and of the country north of the Orange River. As the troops under Lord Roberts advanced the extent of my command increased. I have already referred to the general situation in the Orange River Colony. The great difficulties of my command commenced about the time Lord Roberts got to Pretoria. I understand the Commission does not intend to pursue questions in regard to the campaign beyond that date, but I am quite ready to answer any questions.

16923. You have been good enough to prepare some answers to the questions in the Memorandum (*vide Appendix, page 595, post*) we sent you?—Yes. The first question I think is with regard to the numbers sent out. As regards that, not only military but State and political affairs enter into it. It is difficult to say whether the Force originally sent out might have been considered adequate; so much depends on the information the Government was in possession of to guide it in weighing the probabilities of the Orange Free State remaining neutral, and the reliance to be placed on the loyalty of the Dutch in the Cape Colony and Natal. Further, to answer this question I must know whether it was intended from the first not only to defeat the Transvaal Forces in the field but to subdue and occupy the country; if it was so intended the Force sent out with Sir Redvers Buller was manifestly inadequate. I narrow my evidence with regard to this point to my own experience. With my Division I was strong enough to fight and defeat and follow up the enemy opposed to me from the time we left Modder River until we got to Bloemfontein. Afterwards the character of the enemy's opposition changed into a guerilla warfare. I became responsible for a large extent of country from the Orange River close up to the Vaal. To carry out the subjection and occupation of this country I required troops to occupy every strategic point, drifts and towns and the whole line of the railway with its numerous large and important bridges. These strategic points had to be fortified, supplies and ammunition had to be thrown into them not only for the troops themselves but to help Flying Columns. The above measures were but a part of a general scheme; they would not in themselves have had much effect unless Flying Columns were organised to move about, following up any gathering of the enemy and engaging them. The strength at my disposal was altogether inadequate. I may here say that after the destruction of the Rhenoster Bridge and the captures north of Kroonstadt about the middle of June the enemy poured down into the Colony and was alive all along the line of the railway. With the Force at my command I endeavoured to carry out the subjection of the country; I occupied a number of places, got supplies into them and organised Flying Columns, which were successful in harassing the enemy. Throughout the months of June and September the enemy increased in numbers and enterprise; my operations were limited by the number and strength of the columns I was able to organise, and latterly so vital was the safeguarding of the railway owing to the constant attacks on it that I had to limit the operations of several columns to its vicinity. I was in continual communication with Lord Roberts since about the 18th June; he was made aware of every step I proposed to take and of the results. I got the fullest support both moral and material, but all he could spare and all I could ask for, though willingly given, were altogether inadequate, particularly so as the attacks on the railway became constant. I felt that my greatest strength should be utilised in guarding the one material necessary advantage we had gained, namely the line of the railway. That settles that question.

Then there is a question about the quality of the troops, and I take first the quality of the men of the Regular and Auxiliary Forces in respect of shooting capacity; the Regulars I put down as fair and the Auxiliaries indifferent, as far as I could ascertain.

Then as to horsemanship, the Regulars, Cavalry, and Artillery were good; the Mounted Infantry (newly

formed), bad; latterly much improved; and the Auxiliaries indifferent generally.

Then as to marching: Regulars, good; no complaints of the Auxiliaries.

Then as to horsemastership, the Artillery had some knowledge and aptitude, but the remainder of the Army (Regulars and Auxiliaries, were, in my opinion, bad horsemasters.

Then there is a question about entrenchment and cover. We were generally the attackers; entrenchments do not lend their aid to the attackers to the same extent as to the defenders. I believe, however, in the early part of the War our men were far behind the enemy in their appreciation of and in the construction of defensive works.

16924. But they improved?—Yes, they improved. As the War progressed we copied the Boer methods, and our defensive works were excellent. This was attained by eliminating all cut and dried systems and measurements and allowing the instincts of self-preservation full scope; no questions as to 18 inches or 2 feet were ever thought of. In regard to cover our troops failed from lack of power to observe; they exposed themselves to the enemy's view. The British soldier we recruit as a rule has very little imagination; he finds it very difficult to realise that if he does not see an enemy standing up or on the sky-line he may be hiding behind a rock, this notwithstanding the training at Home, the Officers' Lectures and other means of inculcating this knowledge in the men. The fact is his mental perception is not up to requirements, nor is his education.

Then there is the question of the general physique, and it was apparently good as regards the Regulars, but the heavy sick lists suggest that our soldiers do not come from the healthier classes. The same may be said of the Militia; the Volunteers and Yeomanry seemed healthier.

As to morale, taking the Regulars, considering the disadvantages of our military system in reference to the class our recruits generally come from, the morale was good. It was so in spite of many causes why it might be only indifferent. The chief factor in producing what is good in the morale of our Regular troops is our regimental officer and the relations which exist between him and his men. The Militia did not, and could not be expected to, come up to the Line, but considering everything they came favourably out of a severe test. The Volunteers joining their Line Battalions, with extraordinary quickness assimilated all that was good in our regimental system, of which they form part; and I am bound to say that the Volunteers contributed to it with their many fine qualities; they were intelligent and patriotic and fell into disciplinary order at once. It was necessary, however, to keep them associated with their Line units. All our Forces improved in the course of the campaign.

Deductions as to the Future Training of our Men—The broad deductions I draw are (1) that men and horses should be trained from start to finish by their immediate Commanding Officers and Squadron and Company Commanders and subordinates; (2) that specialists from high to low should be abolished. I do not refer to technical matters. I would here quote that after the manoeuvres of 1895 at Aldershot the Duke of Connaught recommended this, and he said that not only in regard to military training, but in other respects the influences would be all for the better if the men were trained by the officers: his words are: "In my opinion nothing but good to the Army and the officer will result from the officers undertaking the training of their men themselves." Another deduction is (3) that the Reservists should be brought up yearly for ten or twelve days; (4) that field firing should be developed; (5) that, assuming that it is not intended to again make attendance at school compulsory, some inducement in the shape of a money grant be given to all who educate themselves and thus become more intelligent; and (6) Brigade and Divisional manoeuvres should be part of the annual training. In my evidence before the Commission on the previous occasion, I went fully into the question of the soldier's employment in duties not military, and I need not go into that again.

As to the Staff, the servant is very much what the master makes him. A Staff Officer, provided he is well educated with Staff College or Staff Service training

and active, becomes very much what the General makes him. My own experience of our Staff Officers is entirely favourable. I was the head of a large staff at Aldershot. My Staff in South Africa was a comparatively large one, and in both places I was well served. I had full powers to change, and varied and important as were the duties the Staff was equal to them, and I only had to find fault in one case. They were exceptionally good; I practically selected my own Staff; they were adaptable men, and equal to most duties.

16925. (*Viscount Esher.*) Is that Aldershot you are speaking of when you say you practically selected your own people?—I selected them when I was going to Africa; when I went to Aldershot I was allowed to nominate (which is a better word than select my own Staff, and the officers I said I would like to go down with me to Aldershot were appointed. I expected I would be eventually sent to South Africa if reinforcements went, and I took the best men I could find. The circumstances of our Army system and the laws governing or rather limiting Army training and exercises on a useful scale in this country limit the training of the Staff. The individuals are good, but the system of working a Staff is of the first importance.

16926. (*Sir George Taubman-Goldie.*) You say the opportunities are limited; how would you remedy that?—I hope that the officers who have now been trained as Staff Officers will eventually become Generals, and that they will know how to work their staff.

16927. From their experience in the War?—From their experience in the War, and at home.

Then I come to the supply of ammunition. As far as the provision by the Ordnance was concerned, it was always ample in my experience; the amount of reserve ammunition accumulated at Bloemfontein was enormous, and in good condition. I say the same with regard to equipment, and with regard to food and forage. As regards the provisions of the latter, we were at times short of both, owing to transport being insufficient, particularly in the opening part of the campaign.

Then the next question of importance is as to the horses. In the opening phases of the war the numbers were limited; horses and mules were good, but suffered naturally from being underfed; being pushed into work hurriedly, after a long sea voyage, and in some measure from bad horsemanship. From May, horses in very large numbers arrived at Bloemfontein; it was most difficult when a trainload arrived after perhaps 20 days at sea and seven or eight days in the train, to judge what their condition was when purchased. The whole subject has been so thoroughly gone into in the Inquiry on the administration of the Army Remount Department that I can add little to it.

There was a question as to traction engines, but I have already reported twice on the traction engines, and I am ready to do it again. I daresay you have had it before from others.

The next question is as to the Medical and Royal Engineer services. The Royal Engineer services were adequate. The Medical services were gradually brought up to a state of efficiency and sufficiency. I gave very full evidence before the Royal Commission on South African Hospitals, so that I need not go into that. As a subordinate official, I feel that I should not give expression to opinions which have been discussed and decided by the Commander-in-Chief without his special consent.

As to Cavalry, the experience of the War has not tested so much its organisation as its training and armament, and the remarks I have already made on this head need not be repeated.

As to Artillery, I think, speaking generally, the organisation stood the test of the War. The question of an improvement in the armament is under consideration; indeed, it is practically decided. But these questions are apart from organisation. There are questions regarding the ammunition parks and columns under discussion, but they are comparatively small. I do not suppose you want to know about them.

As to Infantry, as far as our military system as a whole admits, the organisation for war is good. I would prefer three Brigades to a Division. The Army Corps organisation was not tested in the South African War. It was not applicable.

As to Mounted Infantry, Mounted Infantry in force

became an absolute necessity if we were to meet our opponents on anything like equal terms; this became clear the more they became disorganised, and refused to meet us in a pitched battle. I believe in every future war Mounted Infantry will be most useful. The late Commander-in-Chief, Lord Wolseley, long since foresaw the value of this adjunct, and always advised us not to wait on other nations but to take the lead in recognising it. The Minutes in the War Office will show that. We did this to a certain extent, and, for operations in Europe, to a fairly sufficient extent in comparison to our army strength. The fact that it was part of our system was an immense advantage to us. I mean that we were able to send the men into the cadres quicker; we were able to train men quicker than if we had been just beginning it. I think the particular conditions of the South African War called for a much larger proportion of Mounted Infantry than would be required in European warfare. The Mounted Infantry, considering the difficulties were organised with great success. The chief factor was the officers. Fortunately, we have in our Army a large number of officers with all the characteristics necessary for the forming of such a force; they ride, they understand horses, they are adaptable, and when placed in positions of responsibility they rise to the occasion.

16928. (*Viscount Esher.*) Are there enough of them?—I think so. We would have to fill up their places in the regiments; that is the difficulty.

16929. That is the precise point, that you have to fill up their places in the regiments?—That is the very great difficulty; not only would we have to fill up their places in the regiments, but every regiment on mobilisation is very short of officers. I think I explained that in my evidence on the last occasion.

16930. You did upon that point, but the moment you take away officers again for Irregular Corps, and so on, it is a further drain upon the Regular battalions of the Army?—Yes, it is a further drain, but there they are; they are able to do it.

16931. Are you doing anything to obviate that? Are you considering any schemes?—As to a reserve of officers.

16932. Yes?—We are considering a scheme as to a Reserve of officers, to take young men that are practically not in the Army at all now, but to give them a month's training and give them a uniform and rank, and all that, and put them into a Reserve of officers. It is a makeshift, but it is the least expensive one that we can adopt, and the only fault I have to find with it is that I am afraid it will hurt the Auxiliary forces, the Yeomanry, Volunteers, and Militia, as officers will go into the Reserve of officers instead of going into the Regular forces.

16933. Have you considered adding to the establishment of officers in the line battalions?—We have considered it very much, but told you in my evidence before, when you said you had heard a great deal was going to be done that nothing would be done, and I think I was right.

16934. Nothing has happened since then to make you alter your opinion?—Nothing whatever, either as to officers or the provision of the men, saving them from doing these civilian duties.

16935. (*Chairman.*) When you were speaking of the inadequacy of the forces, you mentioned that your duty from Bloemfontein was to protect the railway?—No, it eventually ended in that because I could not occupy the country. I found the Boers so aggressive and pouring down to such an extent, the railway and the bridges being continually blown up, that I was partially obliged to give up most of the places I occupied, towns away from the railway, and to concentrate everything on the protection of what I thought was the one important point.

16936. I did not mean to put it in any way controversially; I only meant that the protection of the railway was under your orders at that time?—Quite so.

16937. Were not the troops you had to a large extent Militia?—Yes, to a very large extent Militia.

16938. We had evidence, I think, that some of the difficulties in protecting the railway arose out of that

Lieut.
General Sir
Thomas
Kelly-Kenny,
K.C.B.

25 Feb. 1903.

Lieut.-General Sir Thomas Kelly-Kenny, K.C.B. fact, viz., that the Militia were not equal to Regular troops?—Well, I said that in my evidence, they were not equal and you could not expect them to be equal, but considering everything, they did as much as, and perhaps more than, I anticipated.

25 Feb. 1903. 16939. But the fact that they were not so well trained troops as the Regulars made your task more difficult?—Certainly.

16940. (*Sir George Taubman-Goldie.*) Did you see much distinction in quality between the Reservists and the men who had been serving up to date?—I think there was a distinction in the older Reservists, the Section D, but in the case of the others who had not left the ranks long I did not see very much.

16941. You did not hear of any difficulties as regards discipline?—I did with regard to Section D—in fact I experienced them myself; when they came up they grumbled a great deal.

16942. But the other sections were quite up to the mark of the soldiers who were in the ranks before?—I think so.

16943. They had not lost their military habits?—No, they had not; I could not trace anything against the Reservists I had.

16944. Except Section D?—That is so.

16945. (*Chairman.*) We had some evidence with regard to the large proportion of Reservists in some regiments being detrimental to discipline?—I could quite understand it with a very large body of Reservists coming in perhaps, but I did not experience it in my own Division.

16946. We heard of cases in which there were 60 per cent. of Reservists in a battalion; do you think that would tell against discipline for a time?—I should not say that it would. I quite think that we ought to expect 50 per cent. of Reservists in the ordinary way.

16947. It was merely for a time until the men became accustomed to their duties.

Viscount Esher. And especially to the non-commissioned officers; one of the principal difficulties was that the non-commissioned officers found great difficulty in dealing with the Reservists, many of whom had probably served with them already in the ranks and been senior to them?—It was not so much the difficulty of dealing with Reservists but we had no instrument to deal with them. The difficulty of punishing men in the field is very great.

16948. (*Sir John Edge.*) What did the Section D men grumble about?—They first said they never knew they were to be sent out at all; a great many of them came to me about that, but of course if they had read their undertaking that there signed they would have known that. I suppose they were as a rule more married men amongst them than in Section B; they had settled down with their wives and their pipes more; but I certainly noticed it.

16949. (*Sir George Taubman-Goldie.*) Had the earlier sections lost their practice in shooting?—I could not say, it is so difficult to tell.

16950. We ought to ask colonels of battalions questions of that sort?—Considering that very few people ever saw a Boer it is very difficult to tell whether they hit him or not, or where they hit him.

16951. (*Chairman.*) You say you want the Reservists brought up yearly for 10 or 12 days; what is the object of that?—To keep them up in their military habits and training and shooting, shooting mostly. In fact it is done in every other Army in Europe.

16952. That means that you think they were not so good as they might have been in those respects?—Yes, I think they would be the better for it. For example, of the Section A people, we had very few indeed, and our Reserve system was not quite in full swing. Anticipating this three years' system, I would not think that a man who had served for eight years need be called up, but I am perfectly certain that the three years' man must be called up if it is desired to count him as a soldier; he must be called up after five or six years, and the D people certainly ought to be.

16953. (*Viscount Esher.*) In the War Department when you attempt to initiate a great scheme of re-

organisation, like the Army Corps scheme for example, whose business is that, and who does the actual work? Who draws up a scheme of that kind?—That particular thing was done before I came to the War Office.

16954. But what special Department is there? Is it the business of the Adjutant-General, or the business of the Commander-in-Chief, or that of the Secretary of State, or of the civilian Under Secretary of State, or whose business is it to draft or initiate a great scheme, or any scheme, in the War Office?—I think anybody might do it, and then the Secretary of State would consider it, and no matter who does it, whoever originates it, everybody has a share in it. It is sent round. As regards this particular scheme I do not know, as it was done before I was at the War Office, but I imagine that it was not new. I think it was a revival of the old Army Scheme prepared by Colonel Hume a long time ago.

16955. It is not the particular thing I want to get at but the principle. You are very familiar with the German Army; supposing there was an idea in Germany of converting their system of Army Corps into a totally different system, whose business in the German Army would it be to draw up a scheme of that kind?—That would be the General Staff.

16956. That is to say, something analogous to our Intelligence Department?—Well, I would not like to say that, we have nothing quite the same, but at present the Intelligence Department is responsible for organisation. That is since the late Order in Council, and that would give the Director of Military Intelligence the responsibility, but up to 1901, the Adjutant-General or Commander-in-Chief was responsible.

16957. (*Sir George Taubman-Goldie.*) Now it is the Intelligence and Mobilisation Department?—Yes.

16958. (*Viscount Esher.*) Take questions which are arising now in connection with the organisation of those Army Corps; is much of that work done by Sir William Nicholson and his Branch?—What sort of questions?

16959. I suppose questions do arise as to the actual organisation of these Army Corps themselves, or is the organisation absolutely settled?—Yes, it is all settled. The principal thing since I have been at the War Office has been the decentralisation, and that is all Adjutant General's work; for instance, giving the Army Corps a general power to do things that hitherto have been done at the War Office.

16960. You mean that Sir William Nicholson would have nothing to do with that?—That is so.

16961. (*Sir George Taubman-Goldie.*) That is executive work?—That is executive work; that is Adjutant-General's work.

16962. (*Viscount Esher.*) Supposing such a question as this arose, as to whether it is desirable or not to have a representative of the Financial Branch of the War Office in each Army Corps District (we know there is such a thing), but supposing that question arose as to whether it was desirable or not to retain it, would that discussion be initiated in your Branch or in Sir William Nicholson's Branch?—In neither. I think it would originate perhaps with the Financial Secretary, and then it would be discussed at the War Office Council. That is the line it would take. It would not be initiated in either branch you have named.

16963. Supposing, on the other hand, this question arose, as to whether it was desirable or not to locate permanently an Army Corps in South Africa?—That would be under Sir William Nicholson's Branch, Military Intelligence; he would be in touch with the politicians, and it is the Colonial Office that would know if there was trouble in South Africa. If it was on a question of training it would be my Department.

16964. I do not mean in connection with any idea of hostilities; I mean training?—With an Army like ours a large force like an Army Corps, could not well be taken away and sent for training without considering the political situation.

16965. That is not my point?—If it was for training alone, and if other things did not arise that would be the Adjutant General's business. If no question arose as to the safety of the country or denuding the

forces at home or in India, the Adjutant-General would do it.

16966. But all those questions would arise?—Yes.

16967. Therefore you mean that under those circumstances it would be Sir William Nicholson's business?—He would originate that, but it does not at all follow that it would not be sent round to everybody in the Office, because it is such a complicated matter, the shipping, the transport, the numbers, the drafts, the effect it would have on the depôts at home, all that would have to be

considered, and therefore it would have to go to the Quartermaster-General, and it would have to come to me.

16968. It would not under the present circumstances be discussed by you verbally, but you would all write minutes on it?—We would write Minutes on it, and it would then be discussed at the War Office Council when it was ripe.

16969. It would be discussed at the War Office Council?—Oh, yes.

Lieut.-General Sir Thomas Kelly-Kenny, K.C.B.

25 Feb. 1903

FORTY-SECOND DAY.

Thursday, 26th February 1903

PRESENT :

The Right Hon. the Earl of ELGIN AND KINCARDINE, K.G., G.C.S.I., G.C.I.E. (*Chairman*).

The Right Hon. The Viscount ESHER, K.C.B., K.C.V.O.
The Right Hon. The Lord STRATHCONA AND MOUNT-ROYAL, G.C.M.G.
The Right Hon. Sir GEORGE DASHWOOD TAUBMAN-GOLDIE, K.C.M.G.

Admiral Sir JOHN OMMANNEY HOPKINS, G.C.B.
Sir JOHN EDGE.
Sir JOHN JACKSON.

BERNARD H. HOLLAND, Esq., *Secretary*.

Major-General Sir H. E. COLVILLE, K.C.M.G., C.B., called and examined.

16970. (*Chairman*.) You went to South Africa with Sir Redvers Buller's force?—Yes, with the Guards Brigade in Lord Methuen's column.

16971. And in Lord Methuen's column you commanded the Guards Brigade?—Yes.

16972. And afterwards you were appointed to command the 9th Division?—Yes.

16973. You have been good enough to prepare a statement based upon the Memorandum (*vide Appendix, page 575, post*) which we sent to you?—Yes.

16974. If you have no objection we will take that as an answer and insert it in the evidence:—

1. The principal engagements at which I was present were:—

- (a) Belmont.
- (b) Modder River.
- (c) Magersfontein.
- (d) Paardeberg.
- (e) Poplar Grove.
- (f) Sanna's Post.

(g) Operations of Ninth Division between Ventersburg and Heilbron.

(a) At Belmont the Infantry and Artillery were ample for the purpose, but the Cavalry (two or three hundred lances) was insufficient for effective pursuit, and the enemy was able to retire at his leisure. Lines of wagons were seen filing off unmolested. With a Cavalry Brigade and a Battery of Horse Artillery, well handled, this battle might have resulted in a defeat of the enemy almost as decisive as that at Paardeberg.

(b) At Modder River I consider that we were deficient in Infantry and Cavalry. As I believe that we considerably out-numbered our opponents, it is possible that under European conditions of warfare we might have been strong enough to hold the enemy in front, and detach a sufficient force to outflank him, but owing to the mobility of the Boers, who were nearly all mounted, and the very extended front compared to their strength which this enabled them to cover, practically the whole of our force was used up in holding the enemy in front, and this in such an extended line that we were lacking in the solidity necessary to push home a frontal attack at any point.

As at Belmont, our lack of Cavalry enabled the enemy to retire unmolested. A Cavalry brigade with its battery at Modder River probably would

not have enabled us to capture a great number of prisoners and stores, as we might have done at Belmont, but would undoubtedly have rendered the enemy's position untenable and forced them to vacate it early in the day. This would have had very important bearings on the campaign, as the strain of the long day at Modder River undoubtedly demoralised the troops, and so made the further advance towards Kimberley more difficult.

(c) At Magersfontein we had sufficient Cavalry and Artillery, but insufficient Infantry. After the repulse of the Highland Brigade the Guards Brigade had to hold nearly the whole line (about five miles) between Magersfontein and the Modder River. The extension which this necessitated was the utmost by which the enemy could be held in check, and was too great to allow of an effective advance against an entrenched position; it precluded the possibility of detaching any considerable portion of the Brigade to reinforce the Highlanders.

The advance of the Ninth Division from Enslin to Jacobsdal was on the exposed flank of the Army, and during it no mounted troops except a few raw City Imperial Volunteers were under the command of the General Officer Commanding. I consider that the loss of the convoy at Watervaal Drift, which had such deplorable consequences, was chiefly due to this lack of Cavalry.

(d) At Paardeberg I consider that the force was sufficient to surround and hold the Boer laager, but the lack of a pontoon train caused considerable delay in crossing the river.

(e) At Poplar Grove I had only experience of the work of my own division, which was fully strong enough in Infantry for the task it was called upon to perform, but the total absence of Field Artillery and lack of Cavalry practically nullified the work of the Infantry. I had no Cavalry, but de Lisle's and Henry's Mounted Infantry were nominally attached to me under independent orders from the Chief of Staff.

(f) At Sanna's Post I had sufficient Infantry but no cavalry. When the Ninth Division arrived at Boesman's Kop, the captured guns, etc., of the Second Cavalry Brigade were being taken over the Waterworks Drift eight miles distant. A Cavalry force could have overtaken them, but an Infantry one, especially one already fatigued

Major-General Sir H. E. Colville, K.C.M.G., C.B.

26 Feb. 1903.

Major
General Sir
H. E.
Colville,
K.C.M.G. C.B.,
26 Feb. 1903.

after a good march, could not. As at Poplar Grove, Mounted Infantry (Colonel Martyr's) had been nominally attached to the Ninth Division, but had moved under direct orders from the Chief of Staff, and, at the time the Division arrived at Boesman's Kop, were at Watervaal Drift (six miles distant). The Artillery was sufficient, but owing to the lack of a mobile escort, was useless. This was one of the occasions on which long range guns were required. Unfortunately, it was the only one on which the battery of 4.7 naval guns, usually attached to the Ninth Division, was absent.

(g) During the minor operations between Ventersburg and Heilbron, the Ninth Division, although only consisting of one Brigade, was strong enough in Artillery and Infantry, but its operations were rendered futile by lack of Cavalry; not only did the usual scouting done by Cavalry fall on the Infantry, thus wearying the men out, but all victories were rendered abortive by inability to pursue.

2. I consider that the shooting was bad. This was due:—

- (a) To the fact that all training in the attack had been by volley firing only, with the distance named by the Company or Section Commander.
 - (b) To about two-thirds of the force being reservists who had had no recent training.
 - (c) To the insufficiency of ammunition allowed for training.
 - (d) To want of field firing ranges and the levelling tendencies of the school of musketry.
 - (e) To the invisibility of the enemy.
- The marching was bad at first, owing to
- (a) To the number of reservists.
 - (b) To the men being fresh from shipboard.
 - (c) To the sand and heat of the Karroo.

Later in the campaign the marching became good when the men had serviceable boots. As they wore out an increasing proportion of men fell out after each march, and a long one always had the effect of overcrowding the ambulances next day.

Horsemanship, etc.—I have no experience of this.

Improvised entrenchments were always well and readily done. The men threw away their Wallace equipment at first, but were soon anxious to pick up a fresh one. I consider that, in deliberate entrenchments made under the superintendence of officers, regulations as a rule were too rigidly adhered to, and that sufficient allowance was not made for the varied conditions of the ground. At first officers and men were very stupid about taking cover. I have seen men halted on a rise in full view of the enemy when a few paces forward or backward would have placed them in shelter, the reason being that to have taken this step would have broken the dressing of the line. I have, too, frequently seen an outpost sentry in khaki posted on the enemy's side of a dark bush, when he could have seen equally well through it and been himself unseen, but all this rapidly changed as the war progressed, and by the time I left South Africa I consider that our men were quite as good as the enemy in this respect.

With regard to future training, believing as I do that the art of fighting can only be learnt in the field, I am strongly in favour, at home, of doing all that is possible to maintain discipline and *esprit de corps*.

In any force the percentage of men utterly reckless of their lives must be small, that of men who do their duty without flinching comparatively large, while there must always be a certain percentage of cowards. With both these latter classes discipline and *esprit de corps* are of the utmost importance; the higher the standard of both in the average man, the greater his effort; while nothing but the ingrained instinct of obedience and fear of ridicule of his comrades will drive the coward on. Throughout the War I noticed that the higher the discipline of the regiment, the greater the strain it would bear. The unfortunate incident at Magersfontein, by touching the Highlanders' pride, made them, in my opinion, the finest body of men in the Army.

The question of intelligence *versus* discipline is an extremely difficult one. The best army would undoubtedly

be one formed of highly intelligent and thoroughly disciplined men, but bearing in mind the classes from which our Army is recruited, I fear this is impossible; and believing as I do that a stupid man who thinks for himself is the worst possible sort of soldier, I believe that intelligence should be sacrificed to discipline. Nevertheless, I think more might be done by captains of companies. I look upon them as the most important men in a battalion, and I consider that they should all be selected and given every opportunity of handling their men independently. Apart from the utility of a really good man in training a company in peace time, it is little short of murder to place the lives of 100 men in the hands of any man merely because he happens to be the senior. Being strongly impressed by the importance of discipline, I am in favour of a fair portion of the soldier's time being devoted to close order drill as the best means of instilling automatic obedience, and also of the closest attention being paid to cleanliness, smartness, etc.—all means to the same end—and also encouraging *esprit de corps*.

Shooting is, of course, of the utmost importance, and it is hardly possible to devote too much time to that, while a man who cannot march is practically useless. I consider that every man's marching power should be tested—i.e., that all soldiers should go through a progressive course, and those who cannot reach a certain standard should be drafted. But, having once proved his efficiency, I am no believer in the utility of attempting to keep man or any other animal in a perpetual state of high training which can only end in staleness or possible breakdown. Men should have sufficient practice in extended order movements, outpost work, etc., to prevent them feeling lost when they cease to be touching their comrades; but the conditions of warfare, especially in our Army, must necessarily vary so much that I have no great faith in the utility of constantly practising an attack formation on definite lines, which in all probability will be found unsuitable to the conditions of our next war.

While a strong advocate of smartness and unbending discipline, I am inclined to think that the former quality has been given undue weight in the selection of Non-commissioned officers. In battle a great weight of responsibility often falls on these men, and it is of the utmost importance that they should be quick, intelligent, resourceful, and have an eye for country. In England I believe that reconnaissance classes form the best means of testing these qualities, and, while holding that it is a waste of time to continue this instruction with men who do not show an aptitude for the work, I am in favour of giving every encouragement to such privates as do, and, if they possess the other necessary qualifications, selecting non-commissioned officers from men who have shown aptitude in this direction.

3. The success of any system of training regimental officers must necessarily depend to a great extent on themselves. No system, however good, will force the requisite knowledge into a man who does not want to learn or is indifferent to learning, and it appears to me that the first problem is to find a sufficient inducement to exertion.

The pay of an English officer in the lower ranks is poor, and his expenses are considerable compared with other professions. In the days when trade was thought derogatory to a gentleman, young men of good position had little choice of a profession, but now it is open to anyone to become a civil engineer, to go into the City, the wine trade, the motor-car business, or any of the hundred and one means by which money may be earned by hard work. The Army, on the other hand, has so far been looked upon as a profession in which money will be spent rather than gained, but one in which the work is light and the amusements many; and it has consequently chiefly attracted young men whose inclinations were towards a pleasant, easy life. Many of them are intelligent and some ambitious, and if the public opinion of the Army could be turned to favour work, it is possible that a certain proportion of them would devote their energies to their profession with a fair amount of success; but I do not believe that the Army will ever become a working profession until inducements are offered which will enable it to compete financially with the many trades open in civil life. Whether such financial encouragement would lower the tone of the Army is an open question. Personally, I do not think it would.

Assuming that by some means officers have been induced to take full advantage of the instruction open to them, I consider that the three most important points are :—

- (a) That they should have as little to unlearn as possible.
- (b) That whatever instruction is given them, it should be thorough.
- (c) That they should be encouraged to act on their own initiative and take responsibility.

(a) It is my experience that the best officers are those who join young, direct from a Public School, and that anything which a young officer has learnt or thinks he has learnt, before he joins has to be eradicated by a laborious process. The ideal young officer (as far as this subject is concerned) would be one who joined having acquired a habit of work, no matter at what, and who had an open mind to receive the new teaching in store for him.

(b) At present, perhaps partly due to the fault of the teachers, and partly to that of the pupils, there is a want of thoroughness in the training of regimental officers. They pass examinations, it is true, in a variety of subjects, from interior economy to temporary bridge making, but, as far as my experience goes, only a very small percentage become experts in any one of them, and I think this is due to the levelling-up process, which makes it necessary for all to pass a certain standard in each subject. There are, of course, certain subjects, such as drill, military law, keeping accounts, etc., which it is imperative that all officers should know; but many of the best company officers are wholly unfitted by nature to make a map or draw up a tactical scheme, and, in my opinion, it is a waste of time to engage them longer in such pursuits than is necessary to discover their inability. On the other hand, officers showing marked inclination towards special branches of military knowledge might perhaps be excused a certain amount of drill, be given fuller instruction in their favourite subject and be allowed to gain marks which would be counted in their favour later on, say, at the Staff College.

(c) The greatest fault of our officers, as far as my experience goes, lies in their want of initiative, and I believe this to be entirely the fault of their superiors. In an army which was officered from the ranks, this would be excusable; the necessary discipline of the private must crush individuality, and a private risen to command can hardly be expected to shake off all the influence of his early training. But with a young man fresh from a public school it is just the contrary. He may be lazy and pleasure-seeking, but he is full of ideas; yet should he venture to take any line of his own, say at a field day, it is a certainty that before he has gone many yards, every senior officer within range will be thundering at him, and, after a few such attempts, he gives it up and in time he becomes one of the thunderers. As long as there are men in command who have been brought up in this school, it will be very difficult to change the system; but, in my opinion, all general officers should be strongly urged to check undue interference on the part of officers commanding battalions. It is far better that a young officer should make a few mistakes and learn their consequences for himself, than that he should be so constantly nursed against the possibility of making one, that he becomes a mere puppet, unable to move unless a senior is by to pull the strings.

I have had no experience of Staff College training, except by its results, and of these I cannot speak too highly. Whether the system is the best possible, I do not know, but I have no hesitation in saying that for staff work a Staff College Officer is simply invaluable, and I would never willingly take an officer on my staff who had not been through the College. Every car

should be taken that only the best officers are allowed to go to the Staff College. A Commanding Officer is now required in his annual confidential reports to name the three officers whom he considers the best. Considering the very limited number of vacancies in the College, compared to the total of officers in the Army, I think one would be sufficient, and it should be impressed on Commanding Officers that what is required is not the best Company officer, who might be a great loss to his battalion and no addition to the staff, but the best probable Staff Officer.

With regard to the duties of officers, I can only say that the allotment of duties as laid down by Regulations appear to me quite satisfactory, but I should like to record my experience that those battalions in which the officers' duties are exceeded by the adjutant are generally the worst, and the best are those in which a free hand is left to captains of companies.

As far as my experience goes, the supply of ammunition in the field was satisfactory, but that its conveyance to the firing line was a source of great danger and difficulty is shown by the fact that by far the largest proportion of men mentioned by commanding officers for conspicuous gallantry were ammunition carriers. At Modder River a very large percentage of the wounded were ammunition carriers. At first the supply from home was inadequate. On the second day at Magersfontein G Battery, Royal Horse Artillery had only six rounds per gun left, and the Field Battery about 12; and I believe at that date there was not another round left in Cape Colony.

Equipment reached the Ninth Division at irregular intervals, and sometimes articles of clothing, such as boots, were completely worn out before they arrived. Our food supply was extremely irregular. The greater part of the march from Modder River to Bloemfontein was done on half rations, and after leaving Bloemfontein the Ninth Division rarely got a full ration.

The quality of the supplies was good, with the exception of the "emergency ration" which, owing to its thirst-producing qualities, was useless unless water was plentiful, a rare occurrence on the field of battle, where the ration was most generally required.

I know of no delay or failure on the part of the contractors.

I have no knowledge of the numbers or the quality of horses.

5. I only had experience of ox and mule transport. The former has, possibly, advantages on a Line of Communications in safe country, but in touch with the enemy I greatly prefer the latter. The ox, or at all events the South African one, has the peculiarity of only eating by daylight, and consequently soon starves if marched all day. This necessitates either night marches, which are very trying for the troops, or having to detach a force as escort for the ox convoy if it marches separately. It also takes more room on the road than mule transport. Mule transport can start at a convenient hour for the troops but requires about an hour's halt in the middle of the day for watering, but this is generally also required by the men. The only thing to be said in favour of ox transport in South Africa is that the oxen were generally in better condition than the mules, and could be more easily replaced. The bad condition of the mules, however, was due to the fact that they were put to work before they had recovered from the voyage, and were never given time to get right. During the march to Bloemfontein, too, they were half starved. A scale of transport and mobilisation equipment necessary should be carefully thought out for every country in which our Army is likely to fight, and the loads allotted to each wagon should be adapted to the state of the roads and tracks in that country. Apart from the bad condition of the mules, our wagons were always overloaded. Sufficient transport was never available, and the mobilisation equipment taken out was to a great extent left at Cape Town and Orange River.

6. I have no experience of any hospitals except my own divisional ones, and these were not completed till within about three weeks of the break up of the Division.

Major-General Sir
H. E.
Colville,
K.C.M.G., C.B.
26 Feb. 1903.

Major-
General Sir
H. E.
Colville,
K. C. M. G., C. B.
26 Feb. 1903.

As far as they went they were excellent, but the medical officers were short-handed and insufficiently equipped throughout. We had rarely enough ambulance, and wounded often had to be carried in transport wagons. I have known a case of a large hospital after an action wholly destitute of medical comforts. I consider the work of the medical staff in action to be deserving of the highest praise. I have seen great, and I think needless, suffering to wounded men by being kept on stretchers in the sun all day. I think some light awning is urgently required for hospital stretchers.

In all respects, bridging, ballooning, road-making, improving water supply, and in their many duties, I found the Royal Engineers thoroughly satisfactory. My only criticism of them is that which I have already made regarding entrenchments, that in defensive works they sometimes followed the regulation type too closely, without making sufficient allowance for the nature of the case.

7. Under the peculiar climatic conditions of South Africa the short range of our field guns compared to those of the enemy often placed us at a disadvantage, and there were many occasions on which the 4·7 naval guns, with a range of 10,000 yards attached to my Division, were of great service, but South Africa is probably one of the few countries in the world in which firing at such a range would be effective. On the other hand, as far as my experience goes, the argument that increased weight of artillery would impair its effectiveness in reducing its mobility does not hold good. In support of this I may say that my naval guns, each drawn by 36 oxen, never once failed to be on the spot when they were wanted. I believe it is generally admitted that the effect of artillery fire is more moral than actual, and such is my experience. The number of the enemy killed and wounded by our artillery fire was undoubtedly very small, but, on the other hand, it was most useful in keeping the enemy's guns at bay, in dispersing flank attacks, and in covering the advance of Infantry. I believe the latter to be its principal rôle, as it is only under the cover of an overwhelming fire that Infantry can hope to advance in the open under modern conditions.

I think our Artillery often wasted its energies in attempting to produce an actual, instead of a merely moral effect. At Modder River the Artillery expended a great amount of ammunition on certain houses in which I believe there were no Boers, but although they were in a position to enfilade the enemy's trenches, hardly helped the advance of the Infantry at all. Magersfontein Kopje was bombarded for several hours on the day before the battle with no result, and Cronje's laager at Paardeberg was bombarded for a week with little result; but the covering fire of the Artillery at Belmont enabled the Coldstream Guards to take one of the most difficult positions with little loss, and the covering fire of the naval guns enabled the Black Watch to assault a position of very great difficulty at Vet River (Baviaansberg) with the loss of one man wounded. At Blaauwburg the Artillery enabled the Argyll and Sutherland Highlanders to do the same.

The Lee-Enfield rifle is in my opinion an excellent weapon. Its range was sufficient and its trajectory low enough. For certain purposes, such as the defence of a small isolated post, it is probable that quicker loading, such as that employed on the Mauser, would be an advantage. The quick loading of the Mauser undoubtedly enabled the Boers to pour out a terrific fire at times, but it will be rare for the British Army to act purely on the defensive as they did, and sit in trenches surrounded by boxes of ammunition. Given perfect fire discipline, a very quick-loading rifle is undoubtedly an advantage, but failing this the supply of ammunition in the firing line is a work of such difficulty that it is doubtful whether we should put into the men's hands the means of expending their ammunition more rapidly than at present. The machine guns were frequently of use in the flank, both in warding off flank attacks and in covering the advance of the Infantry. The Vickers-Maxims were also useful for the same purpose, but their effect is more moral than actual. Owing to the stream of dust they raise, they form excellent range-finders, and I think one should be attached to every battery of artillery for this purpose.

With regard to the organisation of the Army, I believe that the system as laid down by regulation at the beginning of the War was as good as it could be. Where

it failed it was not the fault of the system, but because, for various reasons, it was either found to be impracticable or thought inadvisable to carry it out.

With regard to the employment of the different arms, I had little experience of the employment of Cavalry. Our Artillery was, I think, at first too concentrated. The Boers rarely had more than one or two guns in a position, which were so skilfully masked that we rarely succeeded in putting them out of action, while our batteries or brigade divisions afforded them an excellent target. Towards the end of my command I rarely had more than two guns together, and found this worked well.

I found our Field Artillery drill too slow and cumbersome. In the case of the officer in command of a force telling his Commandant Royal Artillery to open fire on a certain spot or body of the enemy, the proceeding is for the latter officer to ride forward accompanied by a trumpeter, two range finders, and two or three other mounted men; having selected a suitable position, a message is sent to the battery or brigade division to come up, and the range is taken by the range finders; all this is seen by the enemy, and if he is a mobile one, such as we had to deal with in South Africa, he has probably got out of range by the time the battery gets into action. Owing to their absence of ceremonial, I usually found that the naval guns, which moved far slower than the Field Artillery, got more shots into the enemy. Their procedure was to move up a slope all together, until the muzzle of the guns just topped it, and then, judging the distance, to fire at the enemy without a moment's delay.

With regard to the employment of Infantry, it should be borne in mind that the conditions of warfare in South Africa were wholly exceptional, and it is unlikely that they will ever be reproduced. The enemy was an armed, mounted nation, of men mostly accustomed to an open air life, and knowing every inch of the country they were defending. The fact of being mounted, combined with their knowledge of the ground, gave them extraordinary mobility, and enabled a small force to safely cover a great extent of ground, with the certainty of being able to concentrate rapidly at any threatened point. Had we ever been able to concentrate an overwhelming force on a given point, the enemy's extended front would have been covered by an opposing force drawn up in the regulation three lines, and the attack would have proceeded in the usual way. Had this been done our losses would undoubtedly have been terrific, but in such an engagement as that at Modder River (a good one to illustrate this side of the question), I believe we should have been successful. As it was, however, in the example under consideration, a front which would have normally taken three divisions had to be covered by one, with the result that the three lines were practically merged into one, gradually thinning, with no hope of reinforcements, and, lacking the impetus which they would have given, it was unable to advance. At the date of the Modder River battle we had not yet learnt enough of our enemy to trust ourselves to the extreme extension which was adopted later, and which enabled even a small force to hold a wide front and still have troops to spare for a turning movement. These latter tactics, the natural outcome of the enemy's peculiarities and our own insufficient strength, were undoubtedly the best for the class of warfare in which we were engaged, but I have grave doubts whether they will prove to be the best in future wars. The Boers had certain qualifications which gave them great superiority in the defence, but they had also certain weaknesses, chiefly due to want of discipline, which rendered their defence weak in one respect, and made them almost powerless in the attack. While their mobility, elasticity, and intelligence made it safe for their leaders to trust to individual initiative for the prompt strengthening of a threatened spot, their general discipline was not good enough to allow of an orderly movement to a flank of a large body in the stress of battle, and thus our flank attacks were rarely opposed. Again, the feebleness in attack allowed us to hold a front with a handful of men, who would have been powerless against such a counter attack as might reasonably be expected from European troops. I do not think, therefore, that our tactics in South Africa, successful as they eventually were, have by any means solved the difficult question of how to reach the enemy's position in face of modern smokeless magazine fire. There is one point however

on which my experience in South Africa has convinced me, and that is that we must not disregard the confidence which companionship gives to human beings, and may take it for granted that whether a close formation is wasteful of life or not, with a thin one (*i.e.*, one in which the men are beyond easy speaking distance) they will never be induced to advance beyond a certain point. When it can be carried out, a turning movement is undoubtedly the best solution to the difficulty, but its practicability must depend partly on the enemy and partly on the position. In one in which the attacker holds interior lines, it will generally be favourable; in one in which they are held by the enemy it will be difficult. In such a case when a frontal advance may be forced on the attacker, I believe, from my experience in South Africa, that the end can only be gained by never allowing any portion of the attacking force to advance unless covered by such an overwhelming fire from the stationary portion that the enemy's fire is paralysed. Machine guns at the flanks are very useful for this purpose. I speak, however, only from my knowledge of the Boers; possibly against highly-disciplined troops even this would be ineffectual.

I consider that the art of crawling, as practised by deer-stalkers, should be taught; on occasions such as the engagement at Modder River and Paardeberg, when the troops lay for hours unable either to advance or retire, it would have been invaluable, and no matter how slow this progress might have been it would probably have enabled them to reach within striking distance of the enemy, had they resorted to it. On both these occasions I noticed that as long as the men remained lying down the Boer fire was very desultory, but if one man rose it brought down a hail of bullets on the line. Yet I have never seen a soldier attempt to move from one place to another except upright. While still in command of the Guards Brigade I tried to have the men taught to crawl, but they were extraordinarily awkward at it, and I do not know if the practice was continued.

I consider that every company should have three officers, and that transport and signalling officers should be supernumerary.

I think a brigadier should always have a battery at his command; without one, he often has to feel for the enemy with his Infantry, and lose men unnecessarily. These batteries could always be concentrated with the divisional artillery if necessary.

I never saw a division complete up to its establishment; there was always a shortage of hospitals, transport, and mounted men.

In future, I think, a division, with increased number of mounted men and guns, is a large enough command for our army; an Army Corps is too cumbersome for one man to deal with. The larger the force under one command, the greater the necessity for depending on the telegraph, a most frequent source of danger and delay. This appears to me to be in accordance with modern tendencies. In the lower commands the exigencies of modern warfare have forced on us the splitting up of responsibility; it is only in the higher ones that the reverse action has taken place. With the enormously increased area of a modern battlefield the section commander has grown from a nonentity to a person of great importance, yet under the same conditions in which considerable organisation is required to command even one division, three divisions have been placed under one command.

As an example of the disadvantage of this system, I would cite the engagement at Poplar Grove, in which Lord Roberts was in command of three divisions, and was therefore in the position of an Army Corps Commander. As the Commander-in-Chief was personally directing the operations, generals of division had not the freedom of action which they would have had in an army in which the division was the highest command, and only a general idea was issued by the Commander-in-Chief; on the other hand, the extent of ground covered—some 14 miles—made it impossible for the Commander-in-Chief to keep in touch with the whole of his command and issue orders to meet each fresh contingency as it arose.

I should like to draw attention to the great use my signallers were to me throughout the operations. Under the conditions of modern warfare, it is often impossible to convey messages by any other means, and I would strongly urge that a certain proportion of brigade and

divisional signallers should be mounted. General officers commanding these bodies are frequently obliged to move rapidly from one point to another of the field of battle, and their signallers being on foot, they are often deprived of their services at the most critical moment.

With reference to the last paragraph of your confidential memorandum, I submit the following *precis* of evidence which I beg to be allowed to give before the Royal Commission, on incidents in connection with which I have incurred the censure of the Commander-in-Chief.

SANNA'S POST AND LINDLEY.

On the 30th March, 1900, at Bloemfontein, I received the following written orders from the Chief of the Staff:—
"O.C. Ninth Division.

"The Division under your command will march at daylight to-morrow to Watervaal Drift on the Modder River, N.E. of Bloemfontein (distance 21 miles). The enemy is reported to be in force on the Leeuw River, and to be advancing S.W. by Thabanchu by Brand's Drift.

"Colonel Martyr's Mounted Infantry from Roodvaal has been ordered to move at daylight on the same point and will be under your orders.

"You will march with four days' supplies complete, and any extra baggage may be left under a guard on your present camping ground.

"By order,
"(Signed) KITCHENER, M.-Gen.
"Chief of the Staff.

"Bloemfontein, March 30th, 1900."

(See Appendix I. A., page 296).

I also received verbal instructions from Lord Roberts to the same effect, with the additional information that General Broadwood's Cavalry Brigade, which was retiring on the Modder River from Thabanchu, would be added to my command as soon as I effected a junction with it. He gave me orders to attack the enemy, chiefly using this Cavalry for the purpose, and to avoid, if possible, becoming seriously engaged with my Infantry.

On the morning of March 31st the Ninth Division left Bloemfontein at 5.30 a.m. (*i.e.*, half an hour before sunrise). Just before reaching Springfield, seven miles from our camp, artillery firing was heard in the direction of the Modder River, and I learnt from the Commandant of that post that General Broadwood's brigade was reported to be heavily engaged between Boesman's Kop and the Modder. I accordingly borrowed from him the few mounted men that he had available as an escort for my guns, and pushed on with them and my staff to Boesman's Kop, leaving word with General Macdonald (my senior Brigadier) to follow as fast as possible with the Infantry.

I reached Boesman's Kop at 11.15 (See Appendix I. A. and II., pages 296 and 298), and the firing had then ceased. I found there Colonel Martyr, who informed me that the 2nd Cavalry Brigade had been cut up and had lost some guns, and were halted about two miles to the eastward. His Mounted Infantry were, he reported, holding the Watervaal Drift, the spot at which they had been ordered to meet me by the Chief of the Staff. From the Kop a good view of the position was obtained. Eight miles distant to the south-eastward the chimney of the Waterworks was visible, and near it clouds of dust evidently raised by a considerable force, while the absence of dust between the Waterworks and the Kop showed that no movement was taking place nearer to us. On the further side of the Modder to the north-eastward two guns were firing, as Colonel Martyr informed me, at his troops at Watervaal Drift. Between Boesman's Kop and the Waterworks I could see two depressions, which reference to the Intelligence Department map showed to be cut by streams flowing into the Modder at a point to the south-east of Watervaal Drift.

Both from Colonel Martyr's report and the evidence of my own eyes, it was plain that (a) the enemy was retiring, presumably with the captured guns, etc.; (b) that the 2nd Cavalry Brigade was halted unmolested; (c) that the retiring enemy had got seven or eight miles start of me. As General Broadwood's force was safe, my one task was to attempt the recapture of the guns.

Major-General Sir
H. E.
Colville,
K.C.M.G., C.B.
26 Feb. 1903.

Major-General Sir
H. E.
Colville.
R.C.M.G., C.B.
26 Feb. 1903.

Even had the Ninth Division reached Boesman's Kop at the same time that I did, any attempt to pursue a mounted force, having at least seven miles start, with a dismounted one, would have been futile under the most favourable circumstances, but the division had not arrived, and did not close up till noon, and it was certain that the Boers would not neglect so obvious a precaution as a rear-guard. Such a guard, even if composed of only a few hundred men, would, I knew from experience, be able to delay us considerably at each of the spruits which intervened between us and the Modder, and would have made the passage of the river itself a lengthy operation. On the other hand the passage of the Modder at Watervaal Drift was already held by Colonel Martyr's mounted infantry, and the road to it was unimpeded.

I therefore determined to cross the Modder at Watervaal Drift, and if possible cut into the enemy's line of retreat, which was more likely to be to the northward than to the southward. If I read the following telegram, which was received during the afternoon, aright, my judgment at the time coincided with that of Lord Roberts.

"The enemy will endeavour to delay you in spruit in order to give themselves time to carry off the guns; it is very desirable therefore that you should make a turning movement, which will enable you to act on their line of retreat. French's Cavalry Brigade, which should shortly be with you, will help to this end. Acknowledge receipt of this." (See Appendix I. A., page 296.)

But although I looked upon this line as the more hopeful of the two, I felt that my chances of overtaking the Boers with a fagged infantry force were slender, and my chief hope lay in the co-operation of the cavalry. I therefore sent my Deputy Assistant Adjutant General, Captain Ruggles-Brise, to summon General Broadwood to Boesman's Kop. As this action has been censured by Lord Roberts, I should like to state (a) that Boesman's Kop was the only place in the neighbourhood from which a good view could be obtained and the general situation explained. From the depression in which the Cavalry Brigade halted, the view was extremely limited. (b) The Cavalry Brigade was unmolested and was under cover of my guns. (c) It seemed to me desirable that I should remain in a position whence a general view of the field of operations could be obtained, and where I should at once be aware of any fresh development. (d) Had I gone to General Broadwood I could not have returned before the arrival of the remainder of my division, and while no inconvenience could have been caused by General Broadwood's temporary absence from his command, delay and unnecessary fatigue of the troops would have resulted had I been absent when the other Brigadiers arrived.

Captain Ruggles-Brise brought back a message that General Broadwood was unable to come. He also reported that he had been himself to the outpost line and had seen no signs of the enemy.

In the meantime the infantry of the Division had arrived, and after a necessary halt (See Appendix VII., page 299)—the men had breakfasted at 3.30, and had marched 13 miles on a very hot day in worn-out boots—the force proceeded to Watervaal Drift. Colonel Martyr's Mounted Infantry had been driven from this, but after some slight resistance we gained the further bank of the river. General French's Cavalry did not arrive until 10 o'clock on the following morning. He was senior to me, but agreed with me that it was then too late to attempt a pursuit.

In his telegraphic despatch of April 1st, on these operations, Lord Roberts said:—

"On hearing this morning that Broadwood was hard pressed I immediately ordered French, with the two remaining Cavalry brigades, to follow in support of the Ninth Division. The latter, after a magnificent march, arrived on the scene of action shortly after 2 p.m."

On my return to Bloemfontein, Lord Roberts, who had previously seen General Broadwood, expressed approval of my action, and ten days later informed me through his military secretary that he had not changed his mind. (See Appendix VIII., page 299.)

On the 24th April, I was ordered to occupy the Waterworks with the Highland Brigade, my other brigade, the 19th, having been detached. I was afterwards informed by Lord Roberts that this reduction of my command was in consequence of my action at Sanna's Post, but I was not aware of this at the time. From the Waterworks we marched to Winburg, and while there, on the 16th May, I received the extract from General Broadwood's despatch given in Appendix I. B. (page 297), with a covering letter asking for explanations, and sent the memorandum, Appendix I. C. (page 297).

On the 19th May I received the following telegram from the Chief of the Staff:—

"Now that the 12th Brigade has commenced to arrive, the remainder of the Ninth Division will march to Ventersburg, whence your command will move on Lindley under further orders, which will be sent you. You should arrange for supplies for this march from Winburg. The 5th Battery R.F.A. has been ordered to be railed to Winburg to accompany you, and you should await its arrival before marching. The Field Hospital, Highland Brigade, and the detachment, 62 all ranks, E. P. Horse, have been ordered to march from here to Ventersburg, starting to-morrow morning; these should arrive 21st at Ventersburg. The 13th Battalion of Yeomanry from Bloemfontein has been ordered to join you at Ventersburg, and you will receive further information as to the date of its arrival there."

On the following day (May 20th) the Chief of the Staff telegraphed:—

"Only two companies of 13th Battalion Yeomanry and possibly one mounted company Lovat's Corps will be able to join you at Ventersburg by the 23rd, but the other two Yeomanry companies will follow as soon as possible."

Later on the same day I received from the Chief of the Staff "further orders" promised in the telegram of the 19th. The message, which was in cipher, ran as follows:—

"From Ventersburg the Highland Brigade march to Lindley, and thence to Heilbron. Regarding supplies D. of S. will communicate with you on the subject. Take as much as you can from Winburg. Brigade will be concentrated Ventersburg twenty-third, reach Lindley twenty-sixth and Heilbron twenty-ninth." (See Appendix I. A., page 296.)

I reached Ventersburg on the 23rd and found that the Highland Brigade Field Hospital and other items promised had arrived, but not the Yeomanry, and acquainted the Chief of Staff of the fact, but received no answer to my telegram till June 20th. (See Appendix IX., page 299.)

On the morning of the 24th May, we marched for Lindley, which we reached on the 26th, after some opposition. On the morning of the 27th, we left Lindley and bivouacked for the night on the further side of the Rhenoster River, at a spot shown on the Intelligence Department map to be 28 miles from Lindley, though I do not think it was so far. During the greater part of the march we were in touch with the enemy, who opposed our advance and harassed our rearguard.

On the following morning, May 28th, an orderly handed me the following memorandum:—

"Colonel SPRAGGE to General COLVILLE.

"Found no one in Lindley but Boers; have 500 men, but only one day's food; have stopped three miles back on Kroonstad road. I want help to get out without great loss.

"B. SPRAGGE.
Lieutenant-Colonel."

"May 27th, 1900.

This was, as I have said, the morning of the 28th, and I was due at Heilbron, two marches distant, on the 29th; therefore, under the most favourable circumstances, I could not return to Lindley and obey the orders given me in the Chief of Staff's cipher telegram of the 20th. I accordingly determined to push on, and sent a message back to Colonel Spragge, informing him of my intentions, and telling him that, if he could not join me by road to Heilbron, he should fall back on Kroonstad, living on the country and, if necessary, abandoning his wagons. (See Appendix III., page 298.) This message failed to reach him.

Remarking on this decision, in his despatch of the 19th July, 1900 (*Appendix I. A, page 297*), Lord Roberts says:—

"The arrival of the Highland Brigade at Heilbron on the date specified was obviously a matter of minor importance to the relief of the 13th Battalion of Imperial Yeomanry, and in my opinion Lieutenant-General Colville displayed a want of military instinct in deciding to continue his march instead of returning to the assistance of the Yeomanry."

With all respect I would submit that, although our arrival at Heilbron on the date specified was a matter of minor importance, it was impossible that I should have been aware of that fact. With the exception of the information given in the above quoted telegrams, I was in total ignorance of the Commander-in-Chief's intentions, which I could at the best only guess at from the disposition of his troops (*Appendix X., page 299*). disposition which favoured the supposition that a large combined movement was in progress—a supposition further favoured by the very precise character of my instructions, which ordered me to make a forced march through an enemy's country, in which unforeseen delays were likely to occur, yet definitely laid down the exact dates at which I was to reach given points. Had it been merely intended that my force should clear the country between Ventersburg and Heilbron a more usual form of order would have been that I was to proceed to Heilbron as quickly as possible. While fully admitting that general officers in the position which I then occupied may be expected to exercise their own judgment in emergencies, and on occasion take the responsibility of acting contrary to orders, I would submit that in order to make them do so with advantage they must be kept informed of their chief's general intentions.

On the 29th January I reported myself to Lord Roberts at Pretoria, and he informed me that as he was dissatisfied with my conduct both at Sanna's Post and with regard to the Yeomanry, he must relieve me of my command, and asked me what I wished to do. I replied that I wished to return to England, and to this he consented. (*See Appendix I. A., page 296*)

After the correspondence given in Appendix I. (A.) (*page 296*), had been before the Secretary of State for War and the Commander-in-Chief, I received an official letter from the Adjutant-General on the 15th September, 1900, directing me to resume the command of the Infantry Brigade at Gibraltar, to complete my period of service therein, exclusive of the time I was serving in South Africa (*See Appendix IV., page 208.*)

On the 21st December, I received at Gibraltar a letter from the Adjutant-General informing me that:—

"The Secretary of State having discussed by telegraph the incidents of the surrender of No. 13 Imperial Yeomanry Battalion, concurs with Lord Roberts that you were mainly responsible for the surrender, and has reluctantly come to the conclusion that you cannot be permitted to retain your command." (*See Appendix V., page 298.*)

It further directed me to hand in my resignation to General Sir George White and "quit Gibraltar." Having respectfully declined to hand in my resignation, I was informed by Sir G. White that on the terms of the Adjutant-General's letter to him it was his duty to see that I left the garrison, and that my command had in fact ceased.

Since my return from South Africa, I had from time to time seen allusions in the Press to a message which I was alleged to have sent to Colonel Spragge and which was supposed to have caused him to push on to Lindley. I attached little importance to these statements at the time, but on my return to England in December I received a letter (*Appendix VI., page 299*) from my late Deputy Assistant Adjutant General for Intelligence, Major Count Gleichen, informing me that he had spoken to a member of Colonel Spragge's force, who had actually seen a telegram signed Colville or Colville, dated Lindley, 23rd May, and which was to this effect:—

"I am greatly in want of mounted troops, come to me here at once."

As I most positively state that I sent no such telegram, and indeed could not have done so if it was dated as

stated, I beg that the Royal Commission may make enquiries into this matter, and peruse the evidence given before the Court of Inquiry on the capture of the 13th Battalion Imperial Yeomanry, as although it has never officially been brought against me, the imputation of having sent such a telegram undoubtedly hangs over me, and whether I have been officially absolved on this score or not, I believe that in the eyes of the public I am still suspected of having forced these men into the predicament from which I refused to extricate them.

In conclusion I may state that all facts concerning the Ninth Division are thoroughly well known to Colonel Ewart, my late Chief Staff Officer, now Assistant Military Secretary at Head Quarters.

16975. We of course can ask any questions and you can make any additions you please as we go along. With regard to the adequacy of the forces you point out various particulars in which you think the force was inadequate at the different engagements?—Yes.

16976. In Lord Methuen's column I suppose it was very much a question of the want of mounted men?—Entirely, I think. At Belmont the Boers escaped chiefly from want of a Cavalry Brigade; I had not very much to do with Graspan myself, but I know that it was equally so there, and that the cavalry actually had to hide while the Boers were streaming away in their wagons, they were so weak. At Modder River there was not the least doubt that a good Cavalry Brigade would have driven the Boers away very early in the day. They could have got round their flank and they would never have held the position.

16977. Of course that would have had a very important bearing upon the campaign?—Yes, if we could have got across Modder River early in the day I think we could probably have advanced towards Kimberley the next day; as it was, it was such a very hard day that I do not think it would have been possible.

16978. At Magersfontein, on the other hand, it was the Infantry that you considered was insufficient?—Yes, I do not think we had quite enough Infantry to cover the whole ground between the kopje and the Modder River. My brigade was extended for a good four miles, and we had only just enough men to hold the ground, without having any to spare to reinforce the Highlanders.

16979. How is it that you can say there were sufficient Cavalry?—We had been reinforced by General Babington's Brigade before Magersfontein; we had then got a whole Cavalry Brigade with Horse Artillery.

16980. So that if you had had to continue your advance to Kimberley, that would have altered the conditions?—Entirely.

16981. On the advance afterwards you again attribute the loss of the convoy to the want of mounted men?—Yes, it did not enable us to scout to the flanks. We had no idea of what the enemy was doing, and we were on the exposed flank. We marched round two sides of an acute angled triangle, of which Watervaal (the scene of the capture) was the apex, and Modder River Station and Jacobsdaal the extremities of the base, and I had no Cavalry to see what was going on upon my flank. Lord Roberts had little either; the whole Cavalry, practically, was away with General French.

16982. It had gone on to Kimberley?—Yes.

16983. At Paardeberg you think the force was sufficient to surround the enemy?—Yes, to surround it, not to take the laager.

16984. Not to force it?—Not to force it; we had sufficient to surround it, and, in fact, we did surround it and held it.

16985. In your subsequent operations I think again it is chiefly a question of the want of mounted men?—Yes.

16986. Is there anything you would wish to add to what you have written here on those points?—No, I do not think so.

16987. Then as to the quality of the men, which is the next head of our memorandum, were you satisfied with the quality of the men generally?—Yes, thoroughly. I think the behaviour of our troops was magnificent.

Major-General Sir
H. E.
Colville,
K.C.M.G., C.B.
26 Feb. 1903.

Major-
General Sir
H. E.
Colville,
K.C.M.G., C.B.

As far as marching was concerned, when they came off ship they were not very good, but they soon got better; as their boots wore out they got bad again, but on the whole I think the marching was good, and the pluck was undeniable.

26 Feb. 1903.

16988. Their shooting was not good?—Their hitting was bad, but of course the enemy were very invisible. I think their shooting was as good as the Boer shooting, but it was bad; I mean we killed very few men comparatively.

16989. (*Sir George Taubman-Goldie.*) Did you not think much of the Boer shooting either?—No; I think the Boers had a certain number of picked shots who did great damage, but I think the rank and file of the Boers were bad shots, in fact, I do not think they aimed, and that many of them just held their rifles over their heads in the trenches and did not aim at all. At Paardeberg (the last day) they were shooting into Lord Robert's camp two miles away, instead of at us at about 90 yards distant.

16990. (*Chairman.*) You think the shooting of the Army would improve if the training was better adapted?—Yes, I believe the supply of ammunition has been increased since those days, but I do not think the men can have too much training in shooting. I think marching and shooting are the most important things.

16991. Can you get the men trained for the sort of work you had in South Africa by the practice at targets?—By field firing; I think field firing practice ought to be extended very much. I do not think the ordinary target practice at the known distances is very much good after the first stages; of course it teaches a man to handle his rifle, and then, as I think I have said, all our training before had been in volley firing at a known distance, or a distance named by the section commander, and of course the great extensions we had in South Africa made volley firing impossible. It was all independent firing out there, and therefore they were doing the attack under new conditions.

16992. And judgment of distance was also poor?—Yes. Of course under the system at home the distance was judged by the company officer or the section commander, whereas in independent firing they had to judge it themselves.

16993. Did they improve in that respect?—Yes, they improved in every respect enormously.

16994. You found that the Reservists wanted more training?—Yes. Of course they had got very slack. Some of them had been two and three years away from the colours and naturally they had got slack. They had "lost their eye" to a certain extent.

16995. Did they soon fall in?—Yes, I think they all fell in very well.

16996. And you were satisfied with them as Reservists?—Yes. I do not think they ever marched quite so well as the other men, and they were rather more inclined to fall out, I thought, but there was really not very much difference, and they were all very good.

16997. And the same remark practically applies with regard to taking cover, that the men improved?—They got very good at that towards the end.

16998. As regards future training you say you are strongly in favour of maintaining discipline and *esprit de corps*?—Yes, my experience is that the discipline is the most important thing, and that the best disciplined regiments always stood any shock best.

16999. And for the independent work of which you have been speaking, you require a well-disciplined man?—A well-disciplined man is certainly required to get him to push on. I do not in the least underrate intelligence, and if both can be obtained I would certainly have them, but my personal opinion is that nothing is more important than discipline.

17000. But there is no reason why the intelligent man should not be a disciplined man also?—No, there is not, but I am afraid the class from which the Army is recruited is not naturally a very intelligent one, the ordinary farm labourer, and so on. The Engineers, I think, are most excellent men. They are both intelligent and disciplined, but I do not think we would ever quite get the rank and file of the Army up to the standard of the Engineers, whatever we did.

17001. (*Sir George Taubman-Goldie.*) Because they are not so highly paid?—And also that they are not so well educated to start with.

17002. If you paid the Infantrymen the same money as the Engineers are paid, do you think we could not get them?—We might. I suppose it is all a question of money.

17003. (*Chairman.*) How will you encourage *esprit de corps*?—By all the little things that soldiers like, such as distinctive uniforms, and there is a great deal in the officers; officers can do a great deal by letting the men always know that their particular regiment is the best in the service and making them thoroughly believe it.

17004. You do attach importance to distinctive uniforms and things of that kind?—Yes, I do; I think the men certainly think a great deal of them.

17005. And the regimental name also?—Yes, that is, of course, almost forgotten now. I think it was important for a certain number of years, but I do not know that it is not nearly forgotten now.

17006. Is it really forgotten?—I do not say altogether, but it is becoming forgotten.

17007. I see constantly mentioned in the despatches, "The Black Watch" and "The Seaforth's"?—Yes; the "Black Watch" was the "Black Watch" even when it was the 42nd. It is remembered, but I do not think it is so strong as it was ten years ago. Personally I like the old numbers, and I think the men like the old numbers best.

17008. Do they like the territorial names, do you think?—I do not think they like them so much as their old names. I think it lies more with the officers than with anybody else, and the tone of the regiment—letting everybody in the regiment know that their particular regiment is the best.

17009. And you attach some importance to the position of non-commissioned officers,?—Yes, I think they are very important in the field; when a battalion is very much scattered it is possible that all the officers may be killed and quite a junior non-commissioned officer may have to take command of a section, or even a company.

17010. In any system of training for the future, importance must be attached to the individuality of the regimental officers?—I think so, certainly.

17011. You think the English officer is underpaid?—I think he is underpaid compared to other civilian employments; of course he is not underpaid compared to Continental officers.

17012. But it tells upon the Army as a whole as a "working profession," I think you put it?—I think when a boy has to make up his mind what he is going into, if he wants to earn a decent income he goes in for some civil employment; if he wishes to live a nice easy life, with a certain amount of honour and glory and not too much hard work, he goes into the Army, and, having made up his mind that he is not going to make any money out of it, he rather thinks it is his right not to do too much work. That is my impression.

17013. You say he has got to unlearn a good deal; what do you mean by that?—I think that young men who join rather late, say at 23, have got very fixed ideas about things and perhaps they have learnt a little drill somewhere, either at a Public School or in a Volunteer Regiment or something, and it is not good drill, and generally they have to be put through the sergeant-major's hands and made to unlearn it again. They are too full of ideas, and I must say I like to catch them young.

17014. You would prefer to catch a boy from the Public Schools rather than to send him through the University?—I should personally; my experience is that a boy who comes straight from the Public School is more adaptable than the boy who has rather formed his habits at the University.

17015. You think the standard they have to work up to is too uniform?—Yes, I do not think it allows for individuality quite enough; a certain number of people are excellent company officers, very good leaders of men, the men like them, and they can do the regimental work very well, but they have not quite brains enough

for staff work. It is a great pity to get rid of those men because they do not know very high tactics and strategy and all the rest of it; they are quite good enough for their position, perhaps better than the highly educated men.

17016. As company officers?—As company officers; they are not fit for anything else.

17017. But surely they are not got rid of now?—No, but they are all trained up to be Staff Officers you may say.

17018. Surely it is only the men who show some power that go to the Staff College?—I am not talking of the Staff College; I am speaking of the ordinary examinations for promotion, I think that people are plucked in those for weakness in strategy, and so on, when they might very well be allowed to stay where they were as company officers. Of course they are quite unfit for anything else. I am not speaking of the officer commanding a battalion; he of course must know his profession thoroughly. The man I am speaking of is an unambitious man who would probably never want to command a battalion, but he likes his company and his company likes him, and he does all the actual routine of the business very well and takes an interest in it.

17019. Would not a man of that kind now stay on in his company until a certain age, at all events?—Yes, he would. What I meant was that I think if that man was given more time to devote himself to his company and to taking the men out and practising them instead of having to worry himself over books which he will never understand, his time would be better employed.

17020. I see; you would prefer that he should not go through the work of the examination at all?—When it is discovered that he is not suited to it.

17021. But an officer might elect to remain as a company officer?—Quite so.

17022. (*Sir George Taubman-Goldie.*) Do you think they would to any extent?—I think there are a certain number of men who hate anything but their companies. I have met a great many who have no further ambition than this: "I love my company, and my company likes me, and that is all I want." Of course it is a peculiar type of man but he is a very useful man in his way. He is the class of man who makes a good country squire.

17023. (*Chairman.*) But the great fault you say, as many others have said, is the want of initiative?—I think so undoubtedly.

17024. How would you get over that?—I think by not worrying the young men when they join about every little thing they do out of order; in manoeuvres and at every field-day you will see a boy taking his company somewhere that he thinks would be a good place to take it to; he has some little trick of his own to get the better of the enemy, but everybody gallops at him and asks him what on earth he is doing, and he is never given any chance of finding out whether he is right or wrong.

17025. (*Sir John Jackson.*) And with a view to encouraging him would you overlook mistakes at that stage?—Yes; when he finds that the result of his action has put him in a hole, he learns for himself very much better than by being told not to do it before he starts.

17026. (*Chairman.*) You yourself did not go to the Staff College?—No.

17027. But you have a high opinion of Staff College officers?—Very, from my experience of them.

17028. Had you Staff College Officers on your Staff?—Yes, nearly all of them were Staff College officers.

17029. And you found yourself well served?—Very well served.

17030. But there was difficulty in South Africa, was there not, in always finding a sufficient number of Staff College officers?—I think there must have been. I was very lucky in that way, and my four most important Staff Officers were all Staff College men.

17031. As regards the next head of our Memorandum about supplies; I think you have nothing which you

would wish to call attention to?—No; as far as quality was concerned they were excellent, except the emergency ration, which was very salt.

17032. That was the tinned meat?—Yes, it was a sort of long sausage-shaped thing in tin, and one end was chocolate and the other was pemmican. It is a very good thing if there is plenty of water about, but the men could not eat it if their water was running at all short.

17033. When was the emergency ration supposed to be used?—In the middle of a battle; take Paardeberg for instance, that was the sort of day when they would certainly want it, because at Paardeberg the men had not any breakfast, and it was a very long day without food, but I do not think any of them could touch the emergency ration. At Modder River I saw a good many men trying to eat it, but they could not, and at Magersfontein the same.

17034. Is it served out before an engagement?—They carry it with them.

17035. Every day?—Yes, but they are not supposed to use it until they are told they may.

17036. If you can bring up the other rations they are supplied with them?—Yes.

17037. As to transport, have you any additional remarks to make?—I think I have said that the wagons were nearly always over-loaded. I think that was chiefly due to the load being calculated for a good European road, and not for the very rough tracks we had there. As I say, on the whole I found the mule transport more convenient than ox transport.

17038. For the mule transport you have to carry the forage?—Yes; of course they do graze them; all our time at Paardeberg there was hardly any forage for them, and they had to get what they could off the very bare grass there.

17039. Then the ox has advantages?—The disadvantage of the ox is that he will not eat at night, and therefore it is necessary to halt in the middle of the day, certainly two or three hours, in order to give him a chance of grazing.

17040. That means night marching?—Yes, which is very tiring to the men.

17041. You found the hospitals undermanned?—Not so much undermanned, but we never had our proper hospitals. A Division is supposed to have its divisional hospital, and there are two brigade hospitals, and then there are the two bearer companies. It was only quite up at the end that I even got one of my brigade hospitals, and I never had a divisional hospital the whole time. We never had our full complement of hospitals.

17042. There was great pressure on hospitals at that time?—Enormous pressure.

17043. As to guns?—Of course there is no doubt our guns were outranged by the Boer guns. I do not think practically that the Boer long range fire did us much damage. I never remember a case of anybody being even hit by one. It was very alarming at first.

17044. (*Sir George Taubman-Goldie.*) You would not say that the practical effect of the Boer guns being of a longer range than ours was very great?—No.

17045. It was greatly overstated in the papers at the time?—Yes, there is no doubt that they dropped shells into us at a range that we could not reply to, but I never saw anybody hit by them. It looked alarming, but I do not think the effect was very great.

17046. I suppose, on the other hand, our lighter guns had greater mobility?—Yes; but as I have said, it is extraordinary how those 4·7's, drawn by oxen, did get about; they were always there when they were wanted. I had a battery of naval 4·7 guns, drawn by 36 oxen each; it seems an extraordinarily cumbersome thing, but they were always there when they were wanted.

17047. (*Chairman.*) The effect of the long range guns of the Boers was moral rather than actual?—Yes.

17048. How is it that if a shell dropped among you it did no harm?—I cannot explain it. There was the

Major-General Sir
H. E.
Colville,
K.C.M.G., C.B.

26 Feb. 1903.

case at Poplar Grove, where the Boers got the range of my naval battery exactly, and they dropped shells into the battery for a good hour. I asked the officer commanding if he thought he ought to change his position, and he said he did not mind in the least, and he stayed there, and they dropped shells among that battery and never even touched a man, a mule or a wagon, or anything else. It was not that they were firing badly, they were firing very well, and they probably thought they were doing tremendous execution, dropping shells into the middle of us.

17049. Was that shrapnel?—That was segment shell

17050. Did the shells burst?—Yes, they burst.

17051. And still did no damage?—No, it so happened that for a whole hour making good practice then never hit a thing.

17052. I suppose the same thing may have happened with our shells?—I should think so undoubtedly.

17053. That goes against the effect of all artillery fire?—I think the moral effect is enormous.

17054. But the actual effect for all artillery fire, would, in your opinion, be rather poor?—I am only judging by my experience there. I do not think it had much effect, but for covering an advance of infantry there is no doubt that its use is very great.

17055. Because it makes the opponents take cover?—Yes, and also makes their firing wild. Of course, in European warfare, the other side would have a large armament, and we should require our artillery to keep their artillery down. With the Boers, we were firing generally against one gun, or at the outside two guns.

17056. The rifle you had a good opinion of?—Yes, I think it is a very good rifle.

17057. And the machine guns?—I do not think the machine guns are quite as accurate as the rifle. I have seen the machine gun tried very often, and it seems to go dropping its muzzle; the range is found, and then it gradually changes the range. Still, it is very useful, especially on the flank for keeping down the enemy's fire, and I think that is the chief use for machine guns.

17058. And the Vickers-Maxim?—Yes, they are practically as heavy as a field gun, but I do not think their range is as great. I do not think their effect is very great either.

17059. It is more moral than actual too?—More moral than actual.

17060. (Sir John Jackson.) What type of Vickers-Maxim gun is that you refer to, the Pom-Pom?—The Pom-Pom.

17061. (Chairman.) As to the organisation of the Army, you think it was good?—Yes, I think so. Of course the transport organisation had to be changed; there was not enough transport, and therefore the regimental transport had to be taken away, and it had to be turned into Army transport.

17062. You think that was a necessary consequence of the position?—I do not think it could have worked in any other way. I do not think it worked as well, but it was necessary.

17063. What do you mean by that?—That battalions on the lines of communication had their regimental transport taken away from them that they did not want, and it was all pushed forward into the pool, so to speak, with the fighting part of the Army.

17064. Is not that always understood to be a possible course to take, even with a system of regimental transport?—Yes, I suppose it is, but I do not think it is quite as handy. If it is necessary to move in a hurry, instead of having the transport available it is necessary to send to headquarters and go through all sorts of channels before the transport can be obtained. For instance, the day I was ordered out to Sanna's Post, or rather, Thabanchu, I had to go to headquarters and see the Director of Transport, and go through all sorts of channels to collect transport for the next day, whereas, if one had had one's regimental transport, one could have had it there and marched off at an hour's notice.

17065. I think I have been misunderstanding you;

I thought you were arguing against regimental transport?—No, I was arguing for it.

17066. You think regimental transport is the better system?—I do, but I do not think it was possible there.

17067. On the march from the Modder River to Kimberley?—Yes, we had not enough transport altogether, and therefore the transport of the battalions on the line of communication had to be taken away from them—they had no use for it and it was taken away, and the whole thing was pooled.

17068. That might have left the regimental transport with other regiments on the march?—Yes, it might; but that was not done, it was thought better to have Army transport.

17069. I understand the illustration you give goes to this, that it would have been better if the regimental transport in that case, at any rate, had still been continued?—Yes, I think it would have been. I do not think anybody likes doing away with the regimental transport.

17070. Do you think the transport is as well managed regimentally?—I think more so. I think there are regimental officers who take an interest in their particular transport, and I think it is better looked after.

17071-2. Of course, the conditions in South Africa in connection with that question as with others were quite different from what they might be elsewhere?—Yes, they were very unusual.

17073. And not likely to recur?—No.

17074. You have stated it very fully here, and I do not know that it is necessary for me to take you further on it?—I do not think there is anything I wish to add.

17075. You have mentioned that it is very difficult to get a soldier to crawl?—Yes, it is very difficult; he cannot get down, and he is more like a camel lying down than anything else.

17076. (Sir George Taubman-Goldie.) Is that from want of gymnastic exercise?—I think it is from want of practice. The ordinary English farm labourers are not sportsmen as a rule.

17077. You think a Division ought to be the largest command, and that an Army Corps is too large?—Yes, I do, personally. There are a great many different opinions about that.

17078. Why do you hold that opinion?—Because I think that if the General of a Division is given a good idea of the Commander-in-Chief's views he can really get on better by acting independently than by being in the hands of a man who really cannot get at him. The Army Corps' Commander in the field cannot get at his three Divisions. It is as much as the Divisional Commander can do to get at the whole of his Division, and the man who has got three Divisions is practically in the same condition as the Commander-in-Chief of the whole Army, he cannot be everywhere at once, and he cannot see more than the Commander-in-Chief. He has got to work it by telegraph to points which he cannot see.

17079. And it is better to leave the responsibility to the men on the spot you think?—I think so, certainly.

17080. That would imply a full statement of the Commander-in-Chief's scheme?—Of course, very full: with an Army Corps that full statement would be given to the Army Corps Commander, and he would give out as much as he thought fit to the Divisional Commanders.

17081. (Viscount Esher.) In Africa, although nominally an Army Corps was sent out it was never commanded practically as an Army Corps, but was split up into Divisions?—The only time I know of was at Poplar Grove, when Lord Roberst had exactly an Army Corps plus the Guards Brigade; he had three Divisions, so that it was exactly an Army Corps.

17082. It was an accidental Army Corps?—Yes, but it was a very good example, I think, of the difficulties of commanding an Army Corps by one man in action. I admit that for administrative purposes between the fights perhaps an Army Corps would be more convenient, but I think in the fight it is difficult to work under modern conditions. At Poplar Grove we covered about 14 miles of ground, and it is impossible for one man to see the whole of that.

*Major
General Sir
H. E.
Colville,
K.C.M.G., C.B.*

26 Feb. 1903.

17083. (*Chairman.*) And you have to depend a great deal upon signallers?—We cannot even signal; we cannot see what our troops are doing, and we have to depend upon reports, and by the time a telegraph message has been sent to the unit, perhaps the whole situation is changed. I think myself it is better that the Divisional Commander should have a very full general idea of the Chief's intentions, and then be allowed to do his best. That is, of course, what is done in a smaller way now; the Commanding Officer cannot command his battalion in action, it is so extended, and everything is left now to the initiative even of the Section Commander. It is the whole tendency of modern war, I think, to leave the responsibility to the Commander of small bodies and to trust to their intelligence.

17084. When I mentioned the signallers it was because of your statement here that under modern conditions a certain proportion of the Brigade and Divisional signallers should be mounted?—Yes, I think it is very necessary. It happened to me two or three times that I had to change my position rapidly in the middle of an action, and the signallers, being on foot, had to run after me as hard as ever they could, and I was perhaps waiting for half an hour or three quarters of an hour before they could catch one up, and it sometimes happened that I wanted to send an important message before they came, and could not do so, whereas, if I had even a couple of men on ponies to gallop after me I could have done it.

17085. We now have the statement (*vide page 289*) which you have headed "Sanna's Post and Lindley." You quite understand with regard to that matter, Sir Henry, that we are quite willing to accept from you your statement of the matter. We do not propose to go into it in detail either as regards strategy, tactics, or personal conduct, but if this is the statement you wish to put before us on this subject we will accept it?—Yes, that is the statement I should like to put before you.

17086. You say it is the *précis* of evidence which you would wish to give; is there any remark you would wish to make in amplification of it?—No, I do not think there is, except that I would like to say that this is the first official occasion I have ever had of telling my story.

17087. And this is the statement you wish to make upon it?—Yes.

17088. I think the only remark I should like to make is with regard to the penultimate paragraph in which you mention the telegram; of course we are not in a position here to go into details which would involve inquiry in South Africa I imagine, but our position is that we accept your denial of having ever sent that telegram, and we put that on record?—Yes.

17089. And that is what you desire us to do?—Yes. I do not know the actual terms of the telegram. I quote the telegram which was quoted to me by Count Gleichen, and I should like to say, if that is the correct date, and it was dated from Lindley on the 23rd May, on the 23rd May I was at Ventersburg, and therefore could not have sent it.

(*Chairman.*) I think we can say that for our purpose, we are perfectly prepared to accept your denial.

17090. (*Sir John Hopkins.*) You had the 4·7 Naval guns with you and you found them fairly mobile?—Yes, they were always there when they were wanted.

17091. Had you naval men with them—sailors?—Yes, entirely.

17092. Had you any 12-pounder Naval guns?—I had a battery at Poplar Grove for the day, but that is the only time I ever had the 12-pounders.

17093. Did you find them useful?—Yes, they did not happen to make very good practice that day; it was hardly a fair trial as I only had one day of them, but it so happened they did not make good practice.

17094. Was the superior range of any advantage on that day?—Yes, it was; we were able to fire at the Boers retiring on the other side of the river, which we could not have done with field guns.

17095. And that was a considerable range?—Yes, I forget the exact range now, but it was getting on for 7,000 yards.

17096. It was considerably over the range of the field guns?—Yes.

17097. With regard to the 4·7, were you satisfied generally with the shooting of that gun?—Yes, I think it was excellent.

17098. And that was also sometimes at extreme ranges?—Yes, we fired once and did some very good work at 10,000 yards.

17099. In fact you found that gun with its superior range of considerable advantage to you?—Yes.

17100. (*Sir John Jackson.*) With reference to what was said about the shells that were fired not doing damage during about an hour's good practice, how many shells do you suppose in that case you refer to were dropped during the hour?—I should say on an average about a shell a minute, probably more, but certainly not less than that.

17101. Fifty or sixty shells were dropped?—Yes.

17102. Without doing any damage?—None whatever; there was not a scratch on a wagon or a mule either. It was a very extraordinary thing.

17103. (*Sir George Taubman-Goldie.*) I have no doubt that you have cut down your statement to the fewest words possible, but it necessarily with the appendices covers several pages of print, and I just want to ask you three questions with regard to Sanna's Post and two with regard to Lindley, brief questions, to which you can say "Yes" or "No," or reply to in the shortest possible way. General Broadwood's fighting was clearly over some time before you got to Boesman's Kop?—Yes, I should think I was a couple of miles on the Bloemfontein side of Boesman's Kop when the firing ceased.

17104. While from Boesman's Kop you could see all the country round, you could not have seen anything from where General Broadwood was?—No, I thought so at the time, and I verified it afterwards by passing through the ground.

17105. You lost no time at Boesman's Kop, but went straight to the Drift where you had reason to believe the lost guns to be?—I lost no unnecessary time. I gave the men what I considered was a necessary halt for food after their march, and I marched to Watervaal Drift, the best road to the line of retreat of the guns, but the captured guns were not at Watervaal Drift. There were two Boer guns there firing at our troops.

17106. But you believed them to be on their way, from the dust you saw? I am not sure that I understand the statement fully?—I believed they would probably go to the north (that is past Watervaal Drift). It was only a question of probability. It seemed to me very unlikely that having captured these guns they should take them back into a district which we occupied, and very probable—almost certain—that they would go towards their own headquarters, and therefore their route would be to the left and not to the right, and that, therefore, I had a better chance of cutting into their line of retreat by going to Watervaal than to the Waterworks.

17107. At any rate you believed that to have followed by the Waterworks would have certainly lost any chance of getting those guns back?—Certainly, because apart from the route they were likely to take there were three spruits on the way, and having been at the Modder River and Paardeberg fights. I knew what even a hundred men could do at a spruit in the way of stopping us. I thought then, and I think still, we should have had to fight all day to get to the Waterworks.

17108. As regards Lindley, I gather you had received positive orders to be at Heilbron on a fixed date, and you believed your movements were part of a large operation?—Yes.

17109. Which must not be endangered by a failure on your part to arrive on the specified date?—Yes.

17110. You sent a triplicate message to Colonel Spragge, I think?—I did.

17111. And you believed Colonel Spragge could fall back on Kroonstad with some loss?—With great loss, he said.

17112. And that such loss ought not to weigh against

Major-General Sir
H. E.
Colville,
K.C.M.G., C.B.
23 Feb. 1903.

the risk of causing the failure of the Commander-in-Chief's larger operations?—No, my view was that if he was killed to a man it was my duty to go on to Heilbron.

17113. (*Lord Strathcona and Mount Royal.*) You stated that in the latter part of the campaign the marching became good when the men had serviceable boots?—Yes.

17114. Were the boots not of good quality?—I think they were of good quality, but the ground was very rough very often, and the men had a great deal of marching, and naturally the boots wore out, and the fresh supply did not come before they were worn out. There were always periods when we were walking about like beggars, and naturally got very sore heels; and there were periods when we got new boots and were comfortable.

17115. It is of great importance that the boots should be of the very best?—Very great.

17116. But you think there was no cause for complaint with regard to them?—No, I think it was fair tear and wear.

17117. Did you see much of the Colonial forces, that is to say, from the Colonies outside of South Africa, such as Canada and the others?—I had some Canadians with me, and they were magnificent.

17118. They marched well?—They marched well.

17119. Do you know anything with regard to the boots the Canadians had?—No, I do not know the brand, but I inspected my Division at Bloemfontein, and the Canadians were no better off than we were in that respect; all our boots were in holes.

17120. The boots were those that were served out to them in Africa?—Yes, I made almost every man in my Division hold up his feet, so that I could see underneath, and they were all bad; there was hardly a good boot in the Division, at that time. That was about a week after we got to Bloemfontein.

17121. You speak of the emergency rations causing very great thirst; what did they consist of?—I believe it is chocolate at one end, and something like pemmican at the other; it is in two compartments.

17122. So that it would have been much better could they have had fresh meat instead of those rations?—Yes, or even some preparation which was a little less salt. To eat one of those emergency rations produced a raging thirst.

17123. Could the giving of those emergency rations have been avoided? Was it possible to have had other and better rations?—Do you mean on that particular occasion of the fight?

17124. Yes?—I do not think so, because nearly all these fights came as surprises. Of course if one expected a fight, one would order the men to carry cooked rations in their haversacks, but if a fight is not expected it is only giving them rather a nasty meal, instead of a nice hot one. We do not make them carry cooked rations if we can help it.

17125. It was from no defect of transport which could have been avoided?—Not in the least. I think a better brand of emergency ration might possibly be invented.

17126. (*Chairman.*) Is there anything else you would wish to say?—No, thank you, I do not think there is anything else.

APPENDICES.

Correspondence.

CORRESPONDENCE RELATIVE TO THE RECALL OF MAJOR-GENERAL SIR H. E. COLVILLE, K.C.M.G., C.B.

APPENDIX I. (A.)

From Field-Marshal Lord Roberts to the Under Secretary of State for War.

Army Head-quarters, South Africa,
Pretoria, 19th July, 1900.

Sir,
Referring to the circumstances under which Lieut.-General Sir H. E. Colville, K.C.M.G., C.B., has been ordered home, I have the honour to state that on two occasions he has shown a want of initiative and military capacity, which, in my opinion, rendered it undesirable to retain him in the command of a division in South Africa.

2. His action on these occasions may be briefly described as follows:—

3. At daybreak on the 31st March, the date of the reverse at Sanna's Post, Lieut.-General Colville was ordered with the Ninth Division from Bloemfontein to Boesman's Kop to cover Brigadier-General Broadwood's retirement from the Waterworks. He arrived at Boesman's Kop at noon, but instead of proceeding himself to the scene of action, two miles distant, he sent a Staff Officer to summon Brigadier-General Broadwood to confer with him. Brigadier-General Broadwood could not leave his troops, and, after halting for two hours or more at Boesman's Kop, Lieut.-General Colville moved off towards the Modder River at Watervaal Drift, thus losing all chance of recovering the guns and transport wagons which the enemy had captured a few hours before. Finding that Lieut.-General Colville was not coming to his assistance, Brigadier-General Broadwood had to fall back on Bloemfontein.

A copy of correspondence relative to the occurrences summarised above is appended. It appears that my memorandum dated Kroonstad/the 31st May, 1900, failed to reach Sir Henry Colville, but a copy was sent to him to the 1st July, to the care of the General Officer Commanding Lines of Communication, Cape Town.

4. On the morning of the 27th May, Lieut.-General Colville, with the Highland Brigade, left Lindley for Heilbron and bivouacked that evening at Rhenoster Spruit. He had been promised four companies of Imperial Yeomanry, but, owing to delays on the railway, these did not join him at Ventersburg, as had originally been intended; they followed him up, however, and reached Lindley on the afternoon of the very day on which Lieut.-General Colville left that place. At 7 a.m. on the 28th May, Lieut.-General Colville received a message from Lieut.-Colonel Spragge, commanding the Thirteenth Battalion of Imperial Yeomanry to the effect that on approaching Lindley he had found it occupied by the enemy, and had consequently taken up a position some three miles east of the town. Lieut.-Colonel Spragge stated that he had only one day's supplies with him, and asked for help, as he would find it difficult to withdraw without assistance. In the programme of movements which had been communicated to Lieut.-General Colville, he had been told that he should reach Heilbron on the 29th May, and he therefore decided to continue his march, merely sending a message in triplicate to Lieut.-Colonel Spragge, directing him either to join the Highland Brigade at Heilbron by a westerly route, or, if unable to do so, to fall back on Kroonstad. Owing to the vigilance of the Boers this message did not reach Lieut.-Colonel Spragge, the messengers returning later in the day to Lieut.-General Colville. Throughout his march to Heilbron, Lieut.-General Colville was harassed by the enemy, mainly on account of his having no mounted troops; while Lieut.-Colonel Spragge was left to do the best he could, and eventually had to surrender on the 31st May, as Lord Methuen, who made a forced march to his assistance, was unable to reach Lindley in time. The arrival of the Highland Brigade at Heilbron on the date specified was obviously a matter of minor importance to the relief of the Thirteenth Battalion of Imperial Yeomanry, and, in my opinion, Lieut.-General Colville displayed a want of military instinct in deciding to continue his

march instead of returning to the assistance of the Yeomanry, especially as he was without the mounted men, who would have completed his force, and whom he would have obtained had he extricated Lieut.-Colonel Spragge.

5. This being the second occasion on which Lieut.-General Colville had failed to grasp the situation to act with the energy and enterprise which are essential qualifications for command in the field, I felt that I should not be justified in allowing him to remain in the responsible position of a Divisional General. I consequently relieved him of his command and ordered him to return to England.

I have, &c.,
ROBERTS, *Field-Marshal,*
Commanding in Chief, South Africa.

APPENDIX I. (B.)

GENERAL BROADWOOD'S DESPATCH.

Bloemspruit,
20th April, 1900.

(9.) "About noon a Staff Officer arrived from General Officer Commanding Ninth Division, to say he had reached Boesman's Kop. I suggested that a direct advance on the spruit offered the best chance of assisting. About 2 p.m. I was informed that the Ninth Division had moved towards Watervaal Drift; so seeing any hope of recapturing the guns at an end, I began sending the units to their camps as owing to the loss of the baggage it was inadvisable to bivouac where we were."

Forwarded to Lieut.-General Sir H. E. Colville for explanation, 25th April, 1900.

General Colville reported on the 16th May he had not received copy of paragraph 9, General Broadwood's despatch. A second copy was sent him the same day.

APPENDIX I. (C.)

MEMORANDUM BY LIEUT.-GENERAL COLVILLE.

Military Secretary,

With reference to the extract from Brigadier-General Broadwood's despatch of the 20th April, 1900, given in your memorandum of the 25th April, 1900, the statements in that extract do not agree with the facts as reported to me.

On hearing, at Springfield, of the reverse to Brigadier-General Broadwood's Brigade, between the Waterworks and Boesman's Kop, I ordered Lieut.-Colonel Flint to push on with his Brigade Division, and hastened myself to Boesman's Kop, where I found Lieut.-Colonel Martyr, by whom I was informed that Brigadier-General Broadwood's Brigade was then forming up about two miles to the eastward. I at once sent my Deputy-Assistant Adjutant-General, Captain Ruggles-Brise to Brigadier-General Broadwood with a message that I wished to see him, and on his return, Captain Ruggles-Brise reported that Brigadier-General Broadwood had replied to this message that he was too tired to come. Under ordinary circumstances I should have taken serious notice of such an answer, but as I gathered from Captain Ruggles-Brise that Brigadier-General Broadwood appeared to be completely broken down under the circumstances in which he found himself and incapable of co-operation, I thought it better to let it pass. I had no intimation of the suggestion which Brigadier-General Broadwood reports that he made "that a direct advance on the spruit offered the best chance of assisting"; but had I received this message it would not have modified my dispositions unless it had been backed by some facts of which I am still in ignorance.

The position was then as follows:—The Cavalry Brigade was concentrated, and safe, within two miles of Boesman's Kop, its baggage and seven Royal Horse Artillery guns were in the hands of the enemy to the east of Klip Kraal, through which the map showed an affluent of the Modder River to run, while another, and presumably smaller,

affluent ran between it and Boesman's Kop. For an hour before the arrival of my Infantry clouds of dust between Klip Kraal and the Waterworks showed that the enemy was busy, presumably in removing the captured guns and baggage, of which the former would obviously be taken away first. A portion of Lieut. Colonel Martyr's Mounted Infantry was in possession of Watervaal Drift, where they were being shelled by two of the enemy's guns.

Although I did not receive Brigadier-General Broadwood's suggestion, the idea of a direct advance on Klip Kraal was one that naturally offered itself, and had the Cavalry Brigade still been pressed, its reinforcement by the shortest possible route would, I consider, have been imperative; but, with its safety secured, the only problem before me was that of, if possible, retaking the guns. Knowing, from experience, that the enemy's guns generally out-ranged those of our Field Artillery, and seeing before me a level plain, intersected by such spruits or river beds, as the enemy has frequently held for a considerable time against superior numbers, and judging that the enemy had had ample time to get the captured guns at all events as far as the Sanra's Post Drift, it appeared to me that were I to attempt a direct advance I must undoubtedly lose heavily, and that the enemy would have every opportunity of delaying me until he got the captured guns to the eastward of the Modder River, whence he would have an unobstructed line of retreat to Thaba'Nchu. There fore, knowing that Watervaal Drift was in our hands, I decided to effect the passage of the Modder at that point, hoping that, with the aid of Lieut. Colonel Martyr's Mounted Infantry, I might cut into the enemy's line of retreat, while with the Infantry I held him in front to the north of Mamena. I accordingly ordered Lieut.-Colonel Martyr to occupy the hills to the north of our line of march, while the Division and guns advanced on Watervaal Drift, and I sent a further message to Brigadier-General Broadwood, informing him of my proposed action, and asking him to co-operate as far as the condition of his horses would permit.

As detailed in my report of these operations of the 3rd April, 1900, on approaching Watervaal Drift it was found that the Mounted Infantry had been forced to abandon it, and that the enemy was in occupation of it, and a hill some two miles to the north, on the east bank of the river. This necessitated a further turning movement, and a considerable expenditure of time, with the result that it was nearly dusk before the passage of the drift was effected, and some of the troops had already done a 22 miles march, a state of affairs which precluded any further action for that day, even had I been strong enough with only about 4,000 men to hold in front the large force of the enemy which was then visible on the hills above the Waterworks, and detach a sufficient force to cut his line of retreat.

As we were coming into action to the west of the Watervaal Drift, I received the following message from the Field-Marshal Commanding in Chief:—

From Field-Marshal Lord Roberts to Lieut.-General Colville.

"3.28 p.m.

"The enemy will endeavour to delay you in spruit in order to give themselves time to carry off the guns. It is very desirable, therefore, that you should, if possible, make a turning movement which will enable you to act on their line of retreat. French's Cavalry Brigade, which should shortly be with you, will help to this end. Acknowledge receipt of this."

This information as to the speedy arrival of the Cavalry more than compensated for the disappointment which the abandonment of the drift by the Mounted Infantry had caused, and I had still hopes of being able to cut into the enemy's line of retreat, until hour after hour passed without any signs of them, and when at length Lieut.-General French arrived with one brigade, at 10.30 on the following morning, I agreed with him that it was too late to attempt a pursuit.

I may mention that the above quoted message from the Field-Marshal Commanding in Chief appeared to me to so thoroughly sanction the line of action which I adopted, that in my report on the operations, I did not consider it necessary to give my reasons for it.

Correspondence.

I would also point out that in the verbal instructions which the Field-Marshal Commanding in Chief gave me before the Ninth Division left Bloemfontein, he informed me that Brigadier-General Broadwood and his brigade would be under my orders; and had Brigadier-General Broadwood informed me of the reason for his retirement on Springfield, as stated in his despatch, I should certainly have forbidden it; and I beg that I may be permitted to express my opinion that his criticism on my disposition is highly improper.

I have explained above the reasons which then influenced me in making these dispositions, and a fuller knowledge, which I have since gained, of the ground and the enemy's movements has not caused me to modify them, but my judgment may be wholly at fault, and I respectfully await the verdict of the Field Marshal Commanding in Chief.

H. E. COLVILLE, *Lieut.-General,*
Commanding Ninth Division.

WINBURG,
16th May 1900.

*From Field-Marshal Lord Roberts to Lieut.-General
Sir H. Colville, K.C.M.G., &c., Com-
manding Ninth Division.*

Memorandum, Army Head-quarters, South Africa,
Kroonstad, 21st May, 1900.

With reference to the attached memorandum, I am of opinion that, on his arrival at Boesman's Kop about noon on 31st March, Lieut.-General Sir H. Colville acted injudiciously in sending his Deputy-Assistant Adjutant-General to summon Brigadier-General Broadwood, whose column had been seriously engaged with the enemy and was then halted about two miles to the eastward. If Lieutenant-General Colville had ridden on himself to Brigadier-General Broadwood he could have ascertained at once what the actual situation was, how he could best assist the force which he had been directed to support, and what would be the best chance of recovering the captured guns and convoy.

I am further of opinion that Brigadier-General Broadwood, who had been fighting since daybreak, and whose troops were still within striking distance of the enemy, would not have been justified in leaving his command for the purpose of communicating with Lieut.-General Colville. That Brigadier-General Broadwood should have been worn out and perhaps, to some extent, overwhelmed by the reverse which his column had sustained, is not surprising, and on this account it was all the more necessary that Lieut.-General Colville should have lost no time in acquainting himself with the situation and assuming the initiative.

Even if Brigadier-General Broadwood had complied with Lieut.-General Colville's order to join him at Boesman's Kop, serious delay must have occurred, as the Staff Officer from the Ninth Division had first to find Brigadier-General Broadwood, and the latter would have had to ride back and finally rejoin his troops before any concerted movement could have taken place.

By remaining inactive for some time at Boesman's Kop and afterwards moving on Watervaal Drift, Lieut.-General Colville gave the enemy an opportunity of removing the guns and convoy unmolested. They were not slow to avail themselves of this opportunity, and by the time the Cavalry under Lieut.-General French came up, any idea of turning the enemy's flank or cutting off their retreat had to be abandoned, as during the night the Boers had rapidly retired eastwards.

ROBERTS, *Field-Marshal,*
Commanding in Chief, South Africa.

STAFF CHIEF OFFICER'S TIME-TABLE OF SANNA'S
POST AFFAIR, 31ST MARCH, 1900.

Left Bloemfontein	-	-	-	-	5.30 a.m.
General Colville reached Bushman's Kop	-	-	-	-	
with his Staff	-	-	-	-	11.15 a.m.

General Macdonald, leading Highland
Brigade, arrived abreast of Bushman's
Kop - - - - - 11.40 a.m.

The rear part of Division did not close
up to Bushman's Kop - - - - - till past noon

At 12.40 p.m. General Colville issued orders for turning
movement via Waterfall Drift, and at 1 p.m. Division
was moving.

3.25 p.m. Highland Brigade hotly engaged.

APPENDIX III.

SMALLDEEL, 3 p.m.

GENERAL COLVILLE, Winburg.

May 6th.

You will have to garrison Winburg when Ian Hamilton goes on, and as it is impossible to send you supplies, you must supply yourself from country; make the people bake bread and collect live stock for your wants. Do what you can to repair telegraph line between us, we will also send out from here.

C. of S., SMALLDEEL STN.

APPENDIX IV.

Immediate.

War Office,
London, S.W.
15th September, 1900.

57521
1174

Sir,

I am directed by the Secretary of State for War to inform you that the Commander-in-Chief has approved of your resuming the command of the Infantry Brigade at Gibraltar from the 1st October next, to complete your period of service therein, exclusive of the time you were serving in South Africa, and I am to request that you will hold yourself in readiness to embark in time to take up the duties on the above date.

Please acknowledge the receipt thereof, and return the enclosed form to this Department.

I am, Sir,

Your obedient Servant,

(Signed) H. C. B. FARRANT, A.A.G. for A.G.

Major-General Sir H. E. COLVILLE, K.C.M.G.,

C.B., etc., etc.,

Lightwater, Bagshot.

APPENDIX V.

Copy.

Confidential.

War Office,
16th December, 1900

My dear General,

In the temporary absence of the Military Secretary, an unpleasant duty devolves on me

The Secretary of State having discussed by telegraph the incident of the surrender of No. XIII Imperial Yeomanry battalion, concurs with Lord Roberts that you were mainly responsible for the surrender, and has reluctantly come to the conclusion that you cannot be permitted to retain your command.

I am directed to request you will hand in your resignation to General Sir George White on receipt of this letter and quit Gibraltar.

I am sending a copy of this letter to Sir George, but

do not propose to write through the usual channel, as it may be less vexatious to you if the resignation appears to be voluntary.

Yours truly,

(Signed) EVELYN WOOD (A.C.)

Major-General Sir HENRY COLVILLE, K.C.M.G., C.B.
Gibraltar.

Envelope addressed :

CONFIDENTIAL.

Major-General Sir HENRY COLVILLE, K.C.M.G., C.B.,
Gibraltar.

E. W.

APPENDIX VI.

Copy.

On my way home between Middleburg and Pretoria on the 10th November, 1900, I met in the train an Imperial Yeomanry Officer—Routledge or Rutledge by name—I think a subaltern, who told me he had been with Colonel Spragge's Yeomanry when they were captured at Lindley, and had been released some little time before I met him.

On discussing the question of the Lindley affair, he mentioned incidentally General Colville's telegram. Knowing that General Colville had sent no telegram in connection with it, I asked him what he meant. He then told me that Colonel Spragge had come to Lindley in great haste from the railway in consequence of a telegram he had received at (I think) Kroonstad. This telegram, which he had seen (Colonel Spragge having shewn it to him) was addressed to Colonel Spragge *by name*—not to "O. C. Yeomanry." It was dated Lindley, 23rd May, and was to the effect "I am greatly in want of mounted troops, come to me here at once—Colville." (I do not know whether the signature was spelt correctly.)

I naturally said at once that this must be a forgery, as we did not get to Lindley till the 26th, and even then there were no telegraph instruments in the office, and the wire was cut. Routledge did not seem surprised, and said they had already (*i.e.*, after their fight at Lindley) had a strong suspicion to that effect, owing to the way in which it was addressed.

He also mentioned that he had subsequently heard that a telegraphist—by name Bell (or something similar)—in the Boer service had played a part in tapping the wires outside Lindley, and was suspected of having been connected with this matter.

(Signed) GLEICHEN, Major, Gren. Gds.
late D.A.A.G., for Intell., 9th Div. S. Africa.

APPENDIX VII.

Cape Town,
Jan. 26th, 1900.

The following instructions by Field Marshal Commanding-in-Chief are communicated for the guidance of all concerned.

By order,
KITCHENER OF KHARTOUM,
Chief of Staff.

NOTES FOR GUIDANCE IN SOUTH AFRICAN WARFARE.

INFANTRY.—As it is desirable that full advantage should be taken of the experience gained during the past three months by our troops in South Africa, the

following notes are issued for the guidance of all who may find themselves in command of a force (large or small) on service in the field

Against such an enemy any attempt to take a position by direct attack will assuredly fail. The only hope of success lies in being able to turn one or both flanks, or, what would in many instances be equally effective, to threaten to cut the enemy's line of communication.

An essential point, and one which must never be lost sight of, is the power of endurance of the Infantry soldier. If Infantry soldiers (carrying as they do a considerable weight on their backs) are called upon to march a longer distance than can reasonably be expected from men in a normal state of health, or if they are injudiciously pressed as regards the pace, they will necessarily commence to feel the strain before they reach a point where their best energies are required to surmount the difficulties which lie before them. If at such a period a man feels exhausted, moral deterioration, and the consequences to our arms which such deterioration entails, must readily supervene.

(Signed) ROBERTS,
Commanding-in-Chief, South Africa.

APPENDIX VIII.

Bloemfontein,
April 15th, 1900.

Dear Cowan,

I have just heard that it is reported in camp that Lord Roberts was very angry with me for not recapturing the guns taken at Klip Kraal on the 31st ulto. If this is so, I hope I may be told, as it is only by having our mistakes pointed out that we can hope to do better in the future; but, as the Chief's only remarks to me on the subject were that we had made a capital march and that he wished he had sent me off the night before, I hope the rumour is not true.

Yours sincerely,
H. E. COLVILLE.

Bloemfontein,
15th April, 1900.

Dear General,

I have shown your letter to the Chief, and he desires me to say that you must not believe idle rumours. If Lord Roberts had felt as the rumour credits him with feeling, he would have told you so before anyone else.

Yours sincerely,
H. V. COWAN.
General Sir H. COLVILLE, &c., &c., &c.

APPENDIX IX.

Received June 20th.
Cable Cart, 24th Front,
G. O. C., Ninth Div., Ventersburg.
19th May. 24th Yeomanry are so late they cannot catch you at Ventersburg. You must march without them. They will join you later *via* Kroonstad.
C. of S

APPENDIX X.

18 Kroonstad.
G. O. C., Winburg,
C. 1692. 18th May.

Hunter occupied Christiana on Tuesday unopposed and expected to be at Phokwani last night. Stop Methuen occupied Hoopstad yesterday without opposition. Ian Hamilton after trifling affair entered Lindley yesterday.
M. S. C.

FORTY-THIRD DAY.

Friday, 27th February 1903.

PRESENT :

The Right Hon. The Earl of ELGIN AND KINCARDINE, K.G., G.C.S.I., G.C.I.E. (*Chairman*).

The Right Hon. The Viscount ESHER, K.C.B., K.C.V.O.
 The Right Hon. The Lord STRATHCONA AND MOUNT-ROYAL, G.C.M.G.
 The Right Hon. Sir GEORGE DASHWOOD TAUBMAN-GOLDIE, K.C.M.G.

Admiral Sir JOHN OMMANNEY HOPKINS, G.C.B.
 Sir JOHN EDGE.

BERNARD H. HOLLAND, Esq., *Secretary*.

Lieut.-General Sir J. D. FRENCH, K.C.B., K.C.M.G., called and examined.

Lieut.-General Sir J. D. French,
 K.C.B.,
 K.C.M.G.

27 Feb. 1903

17127. (*Chairman*.) You joined Sir George White's force, I think, on the 15th of October, 1899?—Yes.

17128. And you took command of the Cavalry?—That is so.

17129. You have been good enough to give us a summary of the evidence that you are prepared to give. With your permission we will put it in?—If you please.

The summary is as follows:—

1. Adequacy in point of strength of the forces in the field at different dates to the work which they had to do.

(A.) Natal (October 15th to November 4th).

(B.) Colesberg Operations.

(C.) Operations for the relief of Kimberley and culminating in the capture of Bloemfontein.

(D.) Operations culminating in the capture of Pretoria.

(A.) *Natal (October 15th to November 4th).*

War broke out on October 11th, 1899. I reached Ladysmith on the morning of October 16th, and at once assumed command of the Cavalry in Natal, under the supreme command of Sir G. White.

I was in command at the battle of Elandslaagte, and was present in command of the Cavalry at the action of Rietfontein and the battle of Lombard's Kop. I also directed reconnaissances in strength on most other days during my stay in Natal.

I am inclined to the opinion that had a vigorous offensive and pursuit been carried out immediately following the victory of Elandslaagte—in conjunction with the forces at Dundee—the forces might conceivably have proved adequate to the task they had to perform, which I take to have been the keeping open of Ladysmith until reinforcements could arrive.

(B.) *Colesberg Operations.*

In the North of Cape Colony for some weeks after the commencement of the War, there were only a handful of troops.

Only a company of Infantry were at the important junction and depôt of De Aar, and the same number at Naauwpoort. On November 21st the mounted garrison at Naauwpoort numbered 75 men!

The first batch of Regular Cavalry only began to reach Naauwpoort at the end of November, and it was the end of December before the horses were really fit for work in the field.

I deduce from this that in the case of an over-sea expedition, the mounted troops should go first, and had they been so sent at the end of 1899, the strength of the forces under me at Colesberg might have been barely adequate to the work in hand.

The task set me by Sir R. Buller was to turn the enemy out of Colesberg, and endeavour to drive them back over the Orange River. The troops available only became adequate (in point of strength) to this task towards the end of January, 1900 when Lord Roberts had arrived, and laid strict injunctions upon me not to commit myself to any serious engagement.

(C.) *Operations for the relief of Kimberley and culminating in the capture of Bloemfontein.*

On February 11th, 1900, the Cavalry Division started from Modder River to the Relief of Kimberley. The passage of the Reit River was forced in the action of February 12th.

The action at the Modder River and the establishment of the Division on the further bank took place on the 13th.

Kimberley was relieved on the 15th.

The action at Macfarlane's Station was fought on the 16th, and Cronje was headed at Paardeberg on the 17th.

Fighting took place on every subsequent day till Cronje's surrender. Later on followed the actions of Poplar Grove and Driefontein and the capture of Bloemfontein.

The strength of the Division at different dates shows that although the numbers at starting were adequate, there being no reserve of men or horses to keep them up, they were certainly inadequate before the close of this series of operations.

Looking to the future, the remedy seems to be to lay down the rule that when a regiment mobilises the reserve squadron should be simultaneously organised into a depôt and sent to the base over-sea to prepare drafts for corps at the front.

(D.) *Operations culminating in the capture of Pretoria.*

During this series of operations the want of an effective system of pushing up Remounts in working condition was still more felt, and the Cavalry Division was, therefore, very much below the strength it should have been to undertake many of the tasks which fell to its lot.

2. The quality of the men of Regular and Auxiliary forces in respect of shooting capacity, marching, horsemanship and horsemastership, entrenchment and cover, general physique, morale and intelligence, regard being had both to the quality of the men when they arrived in South Africa and to any improvement in the course of the campaign. Any deductions from the experience of the War with regard to the future training of the men may also be suggested.

Shooting.

At the commencement of the campaign, the shooting of our troops was moderate. The Cavalry were indifferently armed. The Lee-Enfield carbine was badly sighted, had a short range, and was a clumsy weapon to shoot with. The sighting and magazines of the Lee-Enfield rifle were also clumsy.

Many of the hurriedly-raised South Africans could not shoot at all, and wasted much ammunition. Some of the over-sea Colonials shot well.

Deductions.

More ammunition must be allowed for peace training. Exercises in "Field Firing" must be constantly carried out.

Miniature ranges must be provided in barracks, and shooting made almost a part of a soldier's daily life.

Marching.

The Infantry when first landed were quite unfit to march. They gradually improved, and after two or three months marched extremely well.

The Cavalry and Artillery were handicapped by unfit and underfed horses and by the excessive weights of saddlery and equipment. This was gradually reduced as the campaign proceeded, the Cavalry discarding even their wallets and carrying only stripped saddles and blankets. (Many casualties were caused by inferior saddles and cheap blankets—a very false economy.)

Deductions.

The question of providing light regimental transport to carry the daily requirements of men and horses is most urgent. The recent war proves clearly that, with the extended operations and increased mobility now necessary, it is impossible for the fighting men of any branch of the service to be loaded up with the paraphernalia necessary for their warmth and sustenance at night. Articles such as picket pegs, blankets, mess-tins, cooking utensils, forage and rations must be carried by some light transport (either wheeled or pack according to nature of theatre of war).

Horsemanship and Horsemastership.

This varied greatly in different classes of troops; it seems best to deal separately with each.

(a.) Regular Cavalry.

Horsemanship was generally good, and improved during the campaign as the men grew accustomed to ride over rough ground.

Horsemastership.

Regimental officers and men were very careful of their horses, but their training, especially in regiments from England, had been too narrow. They understood stable management better than the care of horses in the field. For example, very few officers could, at the commencement of the campaign, select the best grazing grounds, as they were ignorant of the African veldt, nor did the grazing guards understand the art of leaving the horses quiet while grazing. At the commencement of the campaign, partly owing to strict orders re looting, many opportunities of foraging were neglected, and it was very often difficult to obtain an adequate supply of good water when operating in large masses. Few officers or men understand how to feed horses on maize, barley, or wheat, which were often to be found in the farms; they either over-fed them, thereby impairing their digestions and giving them Laminitis, or refused to risk this evil, neglecting available supplies. Towards the end of the campaign officers understood better the moderate use of unaccustomed feed, and how to keep horses fit on whatever supplies were available.

(b.) Mounted Infantry.

At the commencement of the War (December, 1899) excepting a few companies furnished by regiments stationed in South Africa, the men could scarcely retain their seats at a trot over rough ground and were entirely ignorant of the first principles of the care of horses. After three months or so, they improved in riding, but few ever became good enough riders to be fit for scouting work. Units also improved in horsemastership as the campaign progressed.

(c.) Colonials.

The over-sea Colonials were good horsemen, but bad horsemasters. A squadron 1st Australian Horse joined the 1st Cavalry Brigade at Osfontein, on March 6th. It was exceptionally well horsed, yet by the end of the month only 10 horses were fit for duty. The squadrons of the Scots Greys, to which regiment the 1st Australian Horse were attached, were reduced in the same period to an average of 30 horses per squadron.

Deductions.

Cavalry soldiers require more training in riding in the open and over rough country. This will be

still more necessary under the present system of three years' service, and will be difficult to carry out in England without a more extended Manœuvres Act.

Lieut.-General Sir J. D. French,
K.C.B.,
K.C.M.G.

27 Feb. 1903.

Entrenchment and Cover.

The men soon became quick at taking cover, and learned to build themselves sangars of stones when in action or on outpost duty. Although the Cavalry were not provided with entrenching tools, troops detailed for outpost duty, after some experience, entrenched themselves with spades carried on the wagons when the ground was not stony enough to enable them to construct sangars.

General physique, morale, and intelligence of the Cavalry Division were good. Many of the Dragoon and Lancer *reservists* were, however, far too big and heavy.

3. Deductions from the experience of the War in connection with the general question of the training and duties of Staff and Regimental Officers.

(a.) Training of Staff Officers.

Besides training officers at the Staff College, a large proportion of officers should yearly take part in Staff Tours under competent officers. By this means uniformity of ideas in staff management and tactics generally would gradually be produced throughout the Army.

Tactics crystallise in Orders: it is essential for officers to be able to understand how to interpret orders correctly, and also to be able to issue clear, complete, and concise orders.

Again, Generals and their staffs should as far as possible be accustomed to work together during times of peace, and general officers should have a voice in selecting their Staff officers. On leaving Modder River for Kimberley, the Generals of Cavalry Brigades and their Staff officers were all new to each other; this was a great disadvantage.

(b.) Training of Regimental Officers.

The self-denial, energy, and general discretion displayed by the regimental officer of the Regular Army throughout the South African War are beyond all praise. His character as a thorough sportsman and a gentleman will last in the traditions of this Empire. At the same time, chiefly owing to want of opportunity in peace time (viz., few men or horses to train, with but little ground on which to drill and manœuvre in England) he took the field less proficient than he might have been in the tactical methods required by modern war. Looking back at the manner in which our regimental officers were constantly handicapped in their efforts to learn their work prior to the War, their attention to duty and general keenness in their work must be regarded as very remarkable.

Deductions:

First.—Strong squadrons should be maintained in peace.

Second.—Give troop, squadron, regimental and brigade commanders more opportunities for training their commands in open country, where mounted and *dismounted* tactical exercises can be carried out in a manner resembling the condition of actual war.

Third.—In order to enable officers to denote the requisite time to their tactical instruction, more must be required from non-commissioned officers in supervising men at stables and in performing minor duties in barracks than has formerly been the case.

4. Supplies of ammunition, equipment, food, and forage. Under this head the Commission desire evidence as to:—

- (a.) The method and sufficiency of supply in the field.
- (b.) Quality of supplies.
- (c.) Any delay or failure on the part of the contractors.
- (d.) The number and quality of horses.

(The method of supplying the cavalry Division on the march is shown, generally, in the Report printed as an Appendix "A" to this day's Evidence. Vide page 317.)

Lieut.-
General Sir
J. D. French,
K.C.B.,
K.C.M.G.

27 Feb. 1903.

(a.) *The Method and Sufficiency of Supply in the Field.*

The method of supply was satisfactory; men as a rule had ample rations, but there was seldom a sufficiency of forage. The quantity of food necessary for horses in hard work is from 15 to 20 lbs. daily, of a mixed ration of oats or other grain to give nourishment, and hay or chaff to furnish bulk. In South Africa full rations were generally 10 lbs. oats. Hay was never procurable excepting in standing camp on the railway. At Paardeberg the grain ration was reduced to 4 lbs. per day. From February 10th to March 7th, 1900, horses were on reduced rations, even when the full ration would have been insufficient. The grazing was indifferent and quite inadequate for the large number of horses concentrated. It was seldom possible to graze troop horses more than three or four hours a day.

(b.) *Quality of Supplies.*

The quality of the rations was generally good, but it was often issued in unsuitable quantities. For mounted troops rations should be drawn in a form suitable for issue to individuals. Cavalrymen are always liable to be sent off on detached duties, as signallers, orderlies, messengers, on small patrols and on various detachments. The bully beef was generally issued in 7 lbs. tins. This was most inconvenient. The man carrying the tin for his mess-mates might be sent off on detached duty, or his horse might be shot or succumb to fatigue, or some of his mess-mates might be sent on detached duties. Moreover, a 7 lbs. tin was liable to displace the balance of the saddle and cause a sore back. This was our experience on the march to Kimberley. In any case, tins of canned meat exceeding 2 lbs. weight are quite unsuitable for Cavalry.

Forage consisted generally of uncrushed oats. This alone is unsuitable food for weary, overtaxed horses. Compressed forage consisting of crushed oats, peas, beans, chaffed hay and lucerne and molassene would be much preferable. Hungry horses will bolt whole oats and derive little benefit, whereas compressed forage cannot be bolted and is more easily digested. In future, slabs of some such compressed forage should be manufactured and issued of sizes suitable for individuals to carry.

(c.) *Delay or Failure on part of Contractors.*

No evidence on this subject is available.

(d.) *Numbers and Quality of Horses.*

The question as to the "numbers of horses" is dealt with partly under heading No. 1, Veterinary Report for May, to show state of remounts received for the general advance, will be found as an Appendix "B" to this day's Evidence. (*Vide page 318, post.*)

The well-trained English horses of the Cavalry Division were reduced by one-third when the Division reached Paardeberg, and by two-thirds when it reached Bloemfontein. At Bloemfontein the remounts issued were good English horses, mostly registered horses, with many of the hunter type. Unfortunately it was necessary for brigades to march as soon as they received their remounts. These were fresh from rail and ship, and only a few extraordinarily-constitutioned horses survived this treatment. At this time the Cavalry suffered greatly from lack of farriers, regiments having to send some of their farriers to the remount department and veterinary hospitals, where staff farriers were deficient. Also the Mounted Infantry were provided with some farriers from the Cavalry. Many horses had been left unshod from the day they were embarked, and time and men were lacking to shoe all the remounts before marching. At Kroonstad more remounts were received, but of inferior quality to those issued at Bloemfontein. The Cavalry Division was again remounted at Pretoria, but the remounts had further deteriorated in quality, consisting largely of Hungarians of the harness or Hackney type.

5. Land Transport, including the use of Railways, Ox and Mule transport traction trains.

Oxen are unsuited for transport with mounted troops in touch with the enemy owing to the hours during which they can work, and at which they must be outspanned to graze.

The mule transport rendered most valuable service. No traction trains were used in connection with the Cavalry Division.

6. The Adequacy of Medical and Engineer services.

(a.) *Medical Services.*—The Medical services were always sufficient; but some of the Colonial ambulance corps seemed to be equipped more suitably for operating with mounted troops than those sent from England.

(b.) *Engineer Services.*—In the earlier stages of the War, Mounted Engineers to accompany Cavalry regiments and Brigades were not always sufficient.

In a country like Europe, where river beds containing water have to be crossed, the want of Mounted Engineers will be more urgently required with Brigades than was the case in South Africa.

7. The Effectiveness of the Guns, Rifles and other Armament used.

(a.) 12-pr. Horse Artillery gun was of very little value.

(b.) 15-pr. field gun a fair gun, but inferior to the majority of the enemy's field ordnance. It is not up to the requirements of modern warfare.

(c.) Pom-pom. Its moral power is greater than its actual killing properties would seem to warrant. Every Cavalry Brigade should be accompanied by two pom-poms.

(d.) The clearness of the atmosphere and high ridges in South Africa enabled ordnance of longer range to be used than could ever be used in Europe.

(e.) A new pattern rifle is being issued to Cavalry and Infantry, so it seems unnecessary to complain now of defects of the old pattern.

(f.) The method of carrying machine guns requires modification to admit of gun being carried either on wheels or on pack horses as country necessitates.

8. Efficiency of the Organisation of the Army.

I have not touched upon the question in this precis, as it appears to me so big a subject, and depends so very much upon what are decided to be the possible theatres in which we may have to fight for the defence of any part of the Empire.

I shall be prepared to answer any questions or give any information which the Commission may desire.

17130. The first matter is with regard to the adequacy of the forces employed. What have you to say with regard to that in Natal?—I have to say very much what I have said here. I do not know whether I could absolutely say so decidedly or not, but I think it is quite conceivable had we pursued after the battle of Elandslaagte, and gone on in conjunction with the troops from Talana, that Ladysmith might not have been shut up. I think it is quite possible the Boers might have retired then behind the Biggarsberg on Newcastle, and Ladysmith might possibly have been kept open until we were sufficiently reinforced to hold, we will say, a line something like the line of the Biggarsberg. But there was another occasion upon which I think, had a certain event come off, it would have made a great difference. That was on the Friday after Elandslaagte, the night of the 27th. I was operating with the cavalry nearly every day, and on, I think it was, the 25th or the 26th, General Yule's column came into Ladysmith, and they were pursued not at all vigorously by Lucas Meyer and some 2,000 to 3,000 Boers. Sir George White sent me out with the Cavalry Division on the morning of the 27th at daybreak, to reconnoitre Lucas Meyer, out to the east, or rather to the north of east, of Ladysmith. In the morning and during the forenoon I was able to draw the enemy's fire of at least 1,000 to 1,500 men, and several guns. I think Lucas Meyer supposed that he was going to be attacked there, and he was evidently taking up a defensive position. I managed to get two or three sketches of the position, one very good one was done by a young cavalry officer, adjutant of one of the regiments there, and I formed a very good idea of what the position was like. I sent back the whole intelligence to Sir George White in Ladysmith in the course of the day. He sent me out considerable reinforcement—four battalions of Infantry, I think it was, two more batteries, and another cavalry regiment. These reached me about seven o'clock in the evening, when I was in bivouac to the east of Lombard's Kop.

He sent written orders to me that I was to attack Lucas Meyer at daybreak. I issued orders for the attack, and made all arrangements, and we had arranged to march on the position at one o'clock in the morning. So far as I remember, about 11 o'clock an order reached me from Sir George White that I was to come back into Ladysmith at once, that he could not risk the attack because he was threatened by the Free Staters on the west. My own opinion is (it is only my opinion) that had that attack taken place Ladysmith might not have been shut up. I firmly believe that it would have been successful, because I had the same men, a great many of them, with me as I had at Elands-laagte, who a few days before had very successfully attacked the position, and the men were very confident; and I had an excellent Infantry leader with me in Sir Ian Hamilton. I think, therefore, it would have been successful, and had it been successful, I think it would also have induced the Boers to retire behind the Biggarsberg.

17131. Those of course are points of tactics?—Quite so.

17132. We are very glad to hear your opinion upon that, but it is not for us to express an opinion?—My point of course is that the forces might then have been adequate for the object in view.

17133. Do you think that even if that attack had been successfully carried out the number of British troops in the Colony were sufficient to prevent Ladysmith being enclosed afterwards?—I think they might have been. I think the Boers might have been so subdued for the time, that they might have retired and not taken up the forward positions which they did, because in reconnoitring them I noticed the whole time they were extremely careful in the way they advanced.

17134. We have had some evidence that the fight at Talana had a considerable effect upon the Boers; that even though the retreat from Dundee followed, the actual fighting at Talana had an effect upon the Boers, and what I gather is that you think another attack and the same successful result would also have influenced their action afterwards?—I think it would, and it would have made Sir George White's force perhaps strong enough to be adequate in fact to hold the enemy off Ladysmith until reinforcements arrived.

17135. You say in your précis that immediately after Elands-laagte was the point of time at which you would have wished a stronger offensive?—Yes, that was the first time, and the second time was the time which I have just narrated.

17136. At that particular point of time the force from Dundee had not arrived, had it?—No, Elands-laagte was fought the day after the battle of Talana Hill.

17137. Because you say here, "in conjunction with the forces at Dundee"?—Yes, I mean in conjunction with the forces at Dundee.

17138. But then the force from Dundee might not have been in conjunction at the time?—I think the pressure would have been taken off the troops at Dundee by reason of our pursuit from Elands-laagte.

17139. Still it comes to this, that if everything had come off all right the results which you foreshadow might have happened?—Yes, exactly.

17140. It was a question of opinion all through?—It was a question of opinion all through.

17141. (Sir George Taubman-Goldie.) But is it your opinion that if the brigade had not been at Dundee, but concentrated with Sir George White's force at first, you could have inflicted a blow upon the Boers which would have checked them for a time, supposing that political considerations had admitted of it?—No; I think it is possible that they would have been better at Dundee, and we should not have had so much chance had Dundee not been occupied.

17142. On the whole you approve of Dundee being held?—Yes. Having commenced a very forward policy the only thing to do was to carry it through.

17143. What number of extra men would have made the force adequate to drive the Boers back behind the Biggarsberg, and to hold them in check for a certain time, given a fair amount of probability, in your opinion?

—I am afraid I cannot very well answer that question because it would be so very much of a guess. I mean so much depends upon, when you get troops, how you use them.

17144. But I am speaking of troops used in the best possible manner, of course. Another brigade, would you say?—Another brigade would, of course, have helped very much indeed. Another brigade would have made it almost a certainty, I think, because the weak point was Van Reenan's Pass, west of Ladysmith, and another brigade would have provided for that.

17145. (Chairman.) Another brigade means 5,000 men?—That would be a fairly strong brigade.

17146. (Sir George Taubman-Goldie.) The Dundee Brigade was about 4,000 strong?—Yes.

17147. (Lord Strathcona and Mount-Royal.) You do not care to give any decided opinion with regard to that?—No, I would not give any absolutely decided opinion. I can give a decided opinion on that last question in saying that if another brigade had been available we could have done that. As it was I think it might have been done, but if another brigade had been there I am sure it might.

17148. It would have secured the position?—Until further reinforcements arrived.

17149. (Chairman.) At Elands-laagte the troops behaved well, did they not?—Very well indeed; no troops could possibly have behaved better.

17150. A question has been raised in the way of criticism of the Cavalry retirement upon Ladysmith?—On what occasion?

17151. At the battle of Ladysmith.—On the 30th October, do you mean?

17152. Yes. Can you say anything as to that?—On that point I can speak with the greatest confidence.

17153. Yes, we were referred to you as being able to give a decisive opinion?—There was absolutely no kind of a hasty retirement. On the other hand, what took place was this: I was holding the line of kopjes to the east of Lombard's Kop (if you follow the place I mean), and I got Sir George White's order to retire. I had commenced the retirement, in fact the men were just running down off the kopjes, when it was reported to me that some Infantry were still in position on our left; this was a false report, but I returned the men to their positions at once.

17154. To relieve?—In order to make sure that the Infantry had retired before the Cavalry gave up their position, but I found out afterwards that this was a false report. Again we came back. On passing through Lombard's Kop with the whole of the Cavalry I was so struck with the strength of the position and how easily it might be held, that I halted the whole of the Cavalry for, I should think, nearly an hour, while I sent a message back to Sir George White to ask him to let me hold Lombard's Kop. I told him that I could do it easily with a few troops, and I did not think it was a good thing to leave it. The answer I got back from Sir George White was that I was to obey my orders, and by that time nearly all the troops were back close to Ladysmith.

17155. There has been a statement that "a seething mass of clumsy broken Cavalry charged down the narrow neck on the west of Lombard's 'Kop,'" is that an exaggerated account?—There is no truth in it. The 5th Lancers got separated in some way or another during a flank movement I was making with the whole Division to try and outflank the enemy. We were under a heavy shell fire, and whether the Commanding Officer of the 5th Lancers thought he could get better cover, or what it was, I do not know, but at any rate he did break away from the Division, and I could not find him for two or three hours. I sent everywhere I could think of after him, but I could not get hold of him, but I knew he was wandering about in a rather aimless way somewhere to the west of Lombard's Kop. The statement to which you refer is pure invention.

17156. That was early in the day?—That was early in the day. I think about 8 o'clock in the morning.

17157. I think the passage I refer to purports to

Lieut.-
General Sir
J. D. French,
K. C. B.,
K. C. M. G.

27 Feb. 1903.

Lieut.-
General Sir
J. D. French,
K. C. B.,
K. C. M. G.

7 Feb. 1903.

relate to the retirement of the troops into Ladysmith at the end of the battle?—Exactly.

17158. At the retirement of the Cavalry at a quarter past 12 and the withdrawal of the Cavalry into Ladysmith there was nothing of the kind?—Absolutely nothing of the kind; very much the contrary, because I was holding them for an hour at Lombard's Kop asking Sir George White if he really wished me to give up Lombard's Kop.

17159. There was nothing that would have affected the morale of the Cavalry afterwards?—Nothing whatever.

17160. Then the next phase of the operations that you speak of is after you left Natal. You left Natal before the siege began?—I left Ladysmith the day it was shut up. I left with the last train that came out.

17161. Then you went to the North of Cape Colony?—Yes, I went to Colesberg.

17162. And there, I understand, again you found your force inadequate?—Most decidedly, the force was very inadequate there.

17163. Especially in mounted men?—Especially in mounted men.

17164. And your conclusion from that is that mounted men ought to have come out at the beginning of the expedition?—I think they should have come out at the very first. Even then they would have been barely in time.

17165. That, I suppose, relates to the special circumstances of the South African case. It would not always be the case that the mounted troops ought to come across first, would it?—I think so; in any oversea expedition I think the mounted troops ought to go first, because it gives the horses a chance of recovering from their voyage, and they would probably be fit to go on when the Infantry arrived.

17166. (*Sir George Taubman-Goldie.*) And the same applies to Artillery there?—The same applies to the Artillery there.

17167. (*Chairman.*) It is mainly on the ground of acclimatisation of the horses, then, that you think the Cavalry ought to go out at the commencement?—And also partly because I think mounted troops are always required first in a campaign for reconnoitring purposes.

17168. But they would not probably be acquired until there was some force of Infantry to move with them or immediately after them?—Probably in a European campaign mounted troops ought to be two or three days' march ahead of the Infantry.

17169. As part of the same movement?—It is conceivable that you might have first of all a very big Cavalry reconnaissance in any campaign. And then there are other objectives, such as deranging and hindering the enemy's mobilization.

17170. So that you were crippled in your operations there until after Lord Roberts' arrival?—I was very much crippled in that way until towards the end of December. Perhaps I might tell you the state of the Force as I had it on the different dates?

17171. If you please?—On the 21st of December R Battery of the Royal Horse Artillery had arrived, and two companies of Mounted Infantry came in, which were previously at Hanover Road, but these companies were in such a state that they were really practically useless until the men had learned to ride better; they were quite unsafe to trust, and I had to throw them up altogether for two or three weeks in order that they might be trained. They were totally untrained.

17172. Were they Mounted Infantry?—Yes.

17173. From the Regular Infantry?—From the Regular Infantry. On the 25th two squadrons headquarters and 12th Lancers arrived, but they left me again on the 2nd of December to go round the Modder River and reinforce Lord Methuen. Another battery of Horse Artillery arrived on the 27th. On the 1st of December the Suffolk Regiment arrived. On the 2nd of December the New Zealand Mounted Rifles arrived. On the 5th December the Carabineers arrived, and about the 8th the Inniskillings. On the 11th of December the 10th Hussars began to arrive, and on

the 14th they were complete. On the 26th the Essex Regiment arrived. So that during December I was gradually reinforced. Beginning from the end of November up to the end of December I was reinforced; but I was not actually strong enough to really carry out the wishes of Sir Redvers Buller as contained in his orders to me until Lord Roberts arrived and General Kelly-Kenny's Division came up to Naauwpoort.

17174. What was the particular object of your operation?—I was ordered by Sir Redvers Buller to keep the enemy back first of all; and secondly, if I possibly could do it, to turn the Boers out of Colesberg and drive them across the Orange River.

17175. So as to get possession of the bridge?—So as to get possession of the bridge. Sir Redvers wanted to clear the north of the Colony.

17176. And that was never possible?—That was never possible. It was quite possible somewhere about the middle or the end of January when I had these reinforcements, and I could have done it then, but Lord Roberts ordered me not to embark on any enterprise where I should have any considerable losses.

17177. So you then moved on to join in his operations?—Yes, I then moved on to Kimberley.

17178. And there again there was the same deficiency in your strength, but it was more in the nature of having no reserve?—That was so. The waste of Cavalry in undertaking operations of that kind is tremendous, and I think always must be. I think there was not sufficient provision made for pushing up reserves of horses.

17179. Do you speak of the reserve squadron—that squadron that is generally kept at home?—Yes.

17180. You think that in case of an expedition it ought to come out?—Yes, it ought to come out and remain at the base.

17181. In the late War there was no reserve of that kind?—No.

17182. So that if you had losses your force was diminished?—It was diminished to a tremendous extent.

17183. A good deal has been said about the condition of the horses in consequence of that march. Is there anything you wish to say with regard to that?—Of course they had very little food. Horses cannot possibly be kept alive on very hard work like that unless they are fed, and it was impossible to feed them.

17184. You could not carry the forage with you?—We could not carry it with us, and after Paardeberg it was not available.

17185. I think you go into the question of horses later on?—I could give the various strengths of the Division, which would probably be interesting to you.

17186. Thank you?—I can give you the casualties in horses during the march to Koodoes Rand Drift and Kimberley. The Division left the Modder River with 5,027 horses. On the 28th of February, the day before the surrender of Cronje at Paardeberg, the strength of the Division was 3,553 horses—we had lost some 1,500 horses.

17187. What did the men do? You had to make them march, I suppose?—Yes. We got remounts, of course, very soon after that. When we got to Bloemfontein we formed dépôts for the men.

17188. But before that what did they do?—They had to march.

17189. You were marching too quickly for the dismounted men?—Yes. The strength of the Division, I might mention, on Monday the 5th of March—that was the day before Poplar Grove—was again 5,655 horses, and during Poplar Grove we lost 213 horses killed and wounded and exhausted; and on Tuesday the 13th of March, the Cavalry Division reached Bloemfontein, and the horse casualties were as follows:—Cavalry, 314 killed (that is in addition to the number at Poplar Grove), wounded or exhausted: Horse Artillery, 134; total, 448; so that adding that 448 to the 213 at Poplar Grove, roughly 650 horses out of that 5,600 horses were killed, wounded, or died.

of exhaustion on reaching Bloemfontein. The rest relates to a time subsequent to that.

17190. Those are in the operations after the advance from Bloemfontein and up to the capture of Pretoria?—Yes; and also the Cavalry Division did a good deal of work to the east of Bloemfontein, at Thabanchu, and Sanna's Post, and Dewetsdorp.

17191. During that period the great difficulty was in pushing up the remounts?—Yes.

17192. So that you were below strength?—Yes. I think generally I may say that in all operations after leaving Modder River through Kimberley, Bloemfontein, and to Johannesburg and Pretoria, the Cavalry Division commenced with an adequate strength, but they dwindled away so much that very soon they got down to a strength which was quite inadequate for the purpose.

17193. Next you have gone into the questions of the quality of the men and so on; I do not think I need take you through those in detail unless there is any point on which you have anything to add?—Nothing whatever.

17194. You mention one point about dividing the light regimental transport?—I think myself that the Cavalry soldier ought to have nothing on him at all except his arms and ammunition.

17195. To take the weight off the horse?—To take the weight off the horse. I think in modern war it is necessary that he must risk a good deal in the way of spending the night out and living on the country, and perhaps having no food at all for a considerable time; but it is absolutely impossible if Cavalry are to do their work, that they can be laden as they were in the last campaign.

17196. (*Sir George Taubman-Goldie.*) Does that apply to campaigns in countries with small areas?—I should say always.

17197. (*Chairman.*) What would this light regimental transport consist of?—Light carts, or pack animals, according to the nature of the country, to carry light equipment and food.

17198. To carry practically what the man now carries with him?—To carry practically what is on the horse now.

17199. Is that a practicable thing to do, to have transport of that kind following close up?—I think it is perfectly feasible. I would sub-divide the present arrangements. I would not keep all the regimental transport together, I would have it in three parts; for the first line I would have small, light carts to accompany the squadrons, that is, practically taking off the horse everything that is on it now and putting it in these light carts; for the second line I would have what is now the regimental transport practically; and for the third line, the supply wagons.

17200. That was really the reason why I asked the question. That this regimental transport which you mention here in your summary does not refer to the question which has been argued between regimental transport and general transport, it is a special thing for mounted troops?—It is a special thing for mounted troops.

17201. But I gather from what you said just now that on the other point you are rather in favour of regimental transport as it exists under the regulations?—I see no objection to regimental transport, I see no reason to alter the regimental transport, provided it is divided up, as I say, into three parts, and it is understood that only the light carts have any chance of being there at night, and very often they would not be there.

17202. But you are aware that there is a considerable argument as to whether the system of regimental transport as provided at the beginning of the War was sufficient, or whether it was necessary to supersede it?—I know that argument was going on.

17203. And have you any opinion upon that point?—I am not prepared with any at the moment. I see no reason why any great alteration in that respect is necessary.

17204. You think the regimental transport followed up by the supply column meets the general case?—I think that is so.

17205. Then, you divide your remarks on horsemanship and horsemastership between the different forces?—Yes.

17206. The Cavalry, I understand, you were pretty well satisfied with on those points?—I think that there is always room for improvement. Of course, some regiments are better than others, but, on the whole I was satisfied.

17207. (*Sir George Taubman-Goldie.*) Are they equal to the Cavalry of France or Germany?—I should think they are certainly better all round horsemen.

17208. (*Chairman.*) And in horsemastership it is a good deal a matter of feeding?—It is altogether a matter of feeding, I think, in the field.

17209. And there the training of the officers and men has not been as precise as it might have been?—I think the officers might have more experience than they had in the care of horses picketed out in the open, and also in the kind of food that often has to be given them in South Africa and other countries of a like kind. I think our Cavalry officers are splendid horsemasters with the kind of food they would get in this country, feeding horses in that way, but I think a little more instruction would be rather good for them as to the sort of food they would use and how they would use it in places like South Africa.

17210. When they had to rough it?—When they had to rough it. I would not make a very strong point of that. I think that the horsemanship and the horsemastership of the Cavalry is very nearly all we can desire.

17211. But with regard to the Mounted Infantry you were not satisfied with their riding?—I gave you an instance when two companies that were sent to me were absolutely dangerous—in fact it was impossible to use them in front of the enemy, and I do not think their riding ever came up to the standard required for efficient scouts in most cases.

17212. Are you speaking of Mounted Infantry?—I am speaking of Mounted Infantry only.

17213. As a whole?—As a whole; that is to say, the regular Mounted Infantry, which have been taken from Infantry regiments. I am not speaking of Colonials.

17214. No, they come next. Do you think the Mounted Infantry can be made satisfactory?—My own opinion is that Mounted Infantry are very useful indeed, and might be most valuable to enable troops to be moved quickly from one point of the battlefield to another; but in the performance of all ordinary Cavalry work I do not think this class of Mounted Infantry, that is to say, Infantry soldiers taken away from their regiments and given a partial training, can ever be made sufficiently fit to take the place of Cavalry.

17215. (*Viscount Esher.*) What sort of training is being given to the Mounted Infantry under your command now?—They are taken away from their battalions a company at a time, and they are trained under very good officers; they are put through a short course of riding, and taught all the elementary duties of practically a Cavalry soldier.

17216. Do you think that the training which is given now at the Mounted Infantry Camp at Aldershot is such as you would suggest should be given to Mounted Infantry?—It is the very best that can be given in the time.

17217. Do you think it is useful?—Yes. But that rather comes into the whole question of the principle of Mounted Infantry.

17218. (*Sir George Taubman-Goldie.*) Is not the object of Mounted Infantry chiefly to carry Infantry about rapidly from place to place?—That should be the only object of it.

17219. You do not look upon scouting as one of their main objects?—I do not think they can ever be trained sufficiently for that.

17220. And as regards Mounted Rifles, what do you say?—They are simply a form of Cavalry.

17221. They would scout, of course?—They would scout, certainly; the Mounted Rifles would be trained Cavalry soldiers to all intents and purposes.

17222. Trained in shock tactics too?—I would train

Lieut.-General Sir J. D. French
K.C.B.,
K.C.M.G.

27 Feb. 1903.

Lieut.-
General Sir
J. D. French,
K.C.B.,
K.C.M.G.

27 Feb. 1903.

the Mounted Rifles to understand what is meant by shock tactics, and I would practice them in it a little, but not so much as I would other Cavalry. I mean, I would make the main weapon of the Mounted Rifleman the rifle, and I would give him something to use mounted in case of necessity; but, on the other hand, I would make the Hussar and Lancer, depend mainly on his sword and lance; and his rifle would be his second weapon. That is the difference I would draw between the two, but I would make them both equally good horsemen.

17223. You said in your Summary just now that few of the Mounted Infantry ever became good enough riders to be fit for scouting work, but that is not their main function?—No, it ought not to be.

17224. (*Viscount Esher.*) But is there not an advantage in having a certain number of men in every battalion trained for scouting purposes?—I think it would be an advantage to have a few men, but not to the extent of a company. I think there is a great advantage in having some; for instance, for an Infantry battalion on the march to have three, four, five, or six mounted men out beyond it would be a very great advantage, if good enough horsemen could be found.

17225. What I understand you rather to deprecate is any attempt to turn the Mounted Infantryman into a Cavalry soldier?—Exactly, or replacing the Cavalry soldier or saying, "You have so much Mounted Infantry, and therefore you cannot want Cavalry."

17226. (*Chairman.*) But you speak of the Mounted Rifles. What Mounted Rifles have we now?—We have none at all now.

17227. And you do not count the Yeomanry as Mounted Rifles?—I was thinking more of the Regular troops. I think the Yeomanry would make very good Mounted Rifles, if that was laid down to be their rôle; my opinion is that it would be a very efficient rôle for them to play.

17228. But you would give them some weapon of offence besides their rifles?—I would give all mounted riflemen that.

17229. What do you point to?—I would give them a sword.

17230. The present Cavalry sword?—I think the present Cavalry sword is the very worst that could possibly be used for any mounted troops at all. I am trying very hard now to get it altered. I think we want more of a rapier.

17231. To be used with the point?—To be used with the point.

17232. Would it be better than giving them the bayonet?—Yes, it would be longer. This sword that I mean is the Italian sword. It is about the same length as the present sword, it may be a little longer.

17233. But it would not be longer than the bayonet on the end of a rifle?—But the bayonet on the end of a rifle cannot be used like a sword with a handle. I am quite against using rifles or bayonets on horses, because I have tried it. I tried it at Colesberg with the New Zealanders. I was very anxious to make Cavalry demonstrations round the flanks, and the New Zealanders had no swords; they had only their rifles and these bayonets, and I manoeuvred them over and over again with these bayonets, and we found they were very clumsy indeed.

17234. But it was represented to us by one witness at any rate, that you might have a bayonet in the form of a sword bayonet to be used for other purposes, but which, when put on to the end of a rifle which riflemen have, would make something like a short spear. You would not agree with that witness?—I do not agree with him, because I have tried it practically, and the New Zealanders of whom I am speaking were very good horsemen indeed.

17235. You think it is necessary that these men, if they are to be used for scouting purposes as mounted rifles, as you define them, should have a weapon of offence?—I think they should, certainly.

17236. And for the Cavalry, as I understand you, you would make the weapon of offence the principal weapon?—I would make the sword or lance always the principal weapon of the Hussar or Lancer, but I

would take the greatest pains with his shooting and in his training. I consider that he can make a tremendous and most valuable use of his firearm, but I think that his main weapon of offence is his sword, and that he ought always to be taught so.

17237. The opinion has been expressed to us by some witnesses that even in the case of cavalry in the future, the principal weapon should be the rifle; you do not agree with that opinion?—I do not agree with that view at all; I absolutely disagree with it.

17238. You think that even under the conditions of modern warfare, the chief weapon of offence of the Cavalry soldier should be his sword?—I do. My reason is that if the Cavalryman is taught that he is to rely mainly upon his rifle, his morale is taken away from him, and if that is done his power is destroyed. He ought to be taught that he can ride at anything or ride over anything. I do not say that the officer who is leading him is always to take him at everything, but the Cavalry soldier all through the ranks ought to believe that he can do anything, and he ought to be taught to believe so; his training ought always to tend that way.

17239. That means a very complete training, does it not?—Certainly.

17240. Therefore, even in the case, probably, of Mounted Rifles, and certainly in the case of Mounted Infantry, you must draw a very distinct line between the Cavalry training and the training for those forces?—Absolutely, because when people are arguing about the difference between Mounted Infantry and Cavalry, and so on, there is one thing which I think very often escapes notice, and that is that in an ordinary campaign, say against France or Germany, or any European country, Cavalry forces will come together, and then the rifle is of no use at all.

17241. In South Africa you never had Cavalry against you?—No, we had not, and that is the reason why we were always able to get round flanks, and go where we chose, but I am absolutely certain that if we are opposed by Cavalry anything like as good as we think our own Cavalry, the leader who gets down off his horses and begins firing (except with one or two squadrons which may be used on the same principle as Horse Artillery is used) is lost.

17242. Is there anything more that you wish to say about the oversea Colonials?—I think I have said pretty well all I want to say about them. Do you mean generally?

17243. I was thinking at that particular moment whether they were the class of troops who would be Mounted Rifles, or Cavalry, or Mounted Infantry?—I think they would make very good Mounted Rifles. I have no doubt that some of them, especially some of the Australians, might be made very good Cavalry, but I am not quite sure whether they are got hold of enough for that, whether they are not too much on the principle of the Yeomanry here in this country.

17244. That is to say whether they get sufficient training?—Whether they get sufficient and regular training. Bringing them out for a day at a time, and an hour or two at a time, and that kind of thing, is not the best training that Cavalry can have for shock tactics, and for overcoming opposing Cavalry.

17245. But for the work that you had to do you found them efficient?—Yes, they were very good. They differed very much of course, but the New Zealanders, to whom I referred just now, were splendid. I mean those under Major Robbins' command; they did some very good work indeed round Colesberg.

17246. (*Lord Strathcona and Mount Royal.*) Had you any opportunity of knowing whether the oversea Colonials were serviceable as scouts?—I had every opportunity of knowing that. I had a great many of them.

17247. Would you say that they were good in scouting?—Most of them were good scouts.

17248. Had you with you, or had you an opportunity of seeing any of the contingents from the North-West of Canada, in which there were a number of the North-West Mounted Police, which is a regular

force there?—I saw them on one or two occasions, and they were excellent.

17249. And they make good scouts?—Very good.

17250. They are accustomed, of course, to roam over the prairies?—That is what is wanted for a scout; you want him to be able to ride over an ordinary country.

17251. (*Viscount Esher.*) And to have a quick eye for country as well?—Exactly.

17252. (*Lord Strathcona and Mount Royal.*) And they had very good staying qualities?—Very good indeed.

17253. (*Chairman.*) You found some of the Reservists too heavy?—We found that they were much too heavy. I am referring to the Reservists who came back into the Cavalry regiments. I think it is a matter that requires attention.

17254. (*Viscount Esher.*) I presume they got lighter as the campaign proceeded?—I suppose they did a little, but not appreciably so.

17255. (*Chairman.*) But you noticed it enough to think that it is a matter that ought to be considered in relation to the question of a Reserve?—I think it ought certainly to be considered in the question of a Cavalry Reserve, because in these days, of course, every thing depends upon the weight put upon the horse.

17256. Have you drawn attention to that?—Several times.

17257. Officially?—Not officially, but I have several times drawn attention to it.

17258. (*Viscount Esher.*) It is rather difficult to suggest a remedy, is it not?—Except keeping up more Cavalry soldiers.

17259. (*Lord Strathcona and Mount Royal.*) Had you no body of specially trained scouts?—We had several corps which were called scouts, generally after the name of the general they were with. They were composed generally of South African colonists.

17260. From their knowledge of the country?—Yes, but they were got from all over South Africa, and a great many of them were got from towns like Johannesburg. They were not always satisfactory, but they did very good work on the whole.

17261. (*Sir George Taubman-Goldie.*) Most of the British in South Africa are in towns, are they not?—Yes, I think so.

17262. (*Lord Strathcona and Mount Royal.*) Is it not customary to have in the Army a body of men who are specially trained and recognised as scouts?—No, I think that is a point which is receiving attention now.

17263. But it has not been so?—It has not been so hitherto. It has been suggested to give special prizes for scouting and to have regular picked scouts, like we have picked shots. It is receiving considerable attention, and I think it is a very good idea and will be very useful; but at the same time I think that a good squadron commander always knew his best scouts, and always had a few men whom he employed particularly in that way.

17264. I believe in the United States they always had scouts available for expeditions, say, as in their Indian wars and such like, for service, and their western country is very much like that of South Africa?—Yes, and I think it was a very good thing.

17265. (*Viscount Esher.*) As commanding the First Army Corps could you commence to organise a body of trained scouts without reference to headquarters?—Yes, provided I adhered to drill regulations. I could not, of course, raise an extra corps.

17266. But you could specially train them?—Yes.

17267. (*Lord Strathcona and Mount Royal.*) You had to pick out the men who appeared most intelligent and most expert for the purpose, but who had had no training whatsoever beforehand for that work?—That is so.

17268. (*Chairman.*) In speaking of the training of staff officers I think what you have just said to Lord Esher has a bearing. Under the new Army Corps

organisation, generals and their staffs would be working together beforehand?—That is supposed to be the great principle of the Army Corps system

17269. And in South Africa you found the disadvantage of the other process?—Yes, it was a very great disadvantage indeed.

17270. Had you a sufficient staff under your command?—I had a particularly good staff. I cannot speak too highly of them.

17271. Were they Staff College men?—There were only two Staff College men—Colonel Haig and Colonel Lawrence.

17272. (*Sir George Taubman-Goldie.*) Two out of how many does that mean, roughly?—Ten or twelve at the time that I had them on my staff.

17273. (*Chairman.*) Were the other men selected by yourself?—No, they were not.

17274. (*Viscount Esher.*) I suppose your personal staff was?—Yes, my personal staff was selected by myself; that is always the case.

17275. (*Chairman.*) But you were satisfied with the work done?—I was more than satisfied with the work done; I cannot speak too highly of it.

17276. Have you any suggestions to offer for the future as to what should be done?—I think I have put in my *précis* what I have to say on that subject. I think it is a principle of the very first importance that the general and staff officers should be accustomed to work together in peace time, and I think that perhaps more attention should be given to that. A great deal is being done as it is, but I think that now the War is over more attention should be paid to the practical training of officers in staff duties. I think that one point in which a great many staff officers showed a want of training was in their methods of expressing themselves in writing orders. I think that they sometimes fail in that respect, and that the meaning of their orders is not always made quite clear. Then I think also that some officers who have had a Staff College training, and have been found to be excellent staff officers, are sent to a place like the Intelligence Department or some office here in London, where they spend the whole day in an office, and really the value of their training at the Staff College is not made the most of in consequence of their not being put with troops. I know of some officers with whom that has been the case. I think the place for a really good staff officer of the kind that is wanted in the field is with troops and not to be tied up in offices in London.

17277. (*Viscount Esher.*) You mean that you want a man with different qualifications for the work in London from what you want for a staff officer in the field?—For certain kinds of work I think we do. I know really very good officers fully qualified for Staff Officers in the field who have been sent almost straight from the Staff College to offices in London, to the Intelligence Department, for instance.

17278. With whom do you think there the fault lies?—I think they should be selected. The Commandant at the Staff College knows all about them and reports their qualifications, and perhaps it is the case that their qualifications may not have been duly looked to when they were appointed, and perhaps sufficient care was not taken in their selection.

17279. The idea is that the Commandant reports upon the special qualifications of an officer on his leaving the Staff College?—I believe he does.

17280. (*Chairman.*) But the work in offices in London is of some importance also?—It is of very great importance, but I think that perhaps men might be found who are more fitted for it than for work in the field.

17281. There ought to be selection in both directions?—In both directions.

17282. I suppose there is selection?—There is, no doubt, selection.

17283. There may have been failure?—Possibly. You cannot expect any new system, of course, to work perfectly.

17284. (*Sir George Taubman-Goldie.*) Would you draw

Lieut.-

a broad distinction between officers who are qualified for Assistant Adjutant-Generals or A work, and officers who are qualified for Assistant Quartermaster-Generals or B work?—I do not know that I would altogether draw that distinction, because I think that the B work very often requires a man who can get about and ride well, and who has an eye for country just as much as A work.

17285. B work requires it even more, does it not?—I think it very often does; looking for camping ground and all that kind of work—Quartermaster-General's work.

17286. Could not a clearer distinction be drawn between the theoretical man, the office man, and the practical man?—I think there might

17287. Would not it be a great advantage?—Yes; that is practically, I think, what I am recommending; that is to say, that there should be more care in selection.

17288. (*Viscount Esher.*) And I suppose it does not necessarily follow that a man who has done exceedingly good work in the Intelligence Branch in London is the sort of man whom you would care to have on your staff on active service in the field?—Certainly not.

17289. That is really one of the points you want to make?—Yes.

17290. (*Sir George Taubman-Goldie.*) I was asking not only with regard to men in London, but in your own corps there is a certain amount of work connected with military law, regulations and so forth, which is purely office work, and requires a theoretical mind?—Yes.

17291. On the other hand, you have, of course, a number of men whom you require for the other kind of work?—Yes; but in a case like Aldershot, for instance, military law is part of the Assistant Adjutant-General's work—that is an A matter. The same man may have to look over courts martial, and see that irregularities do not occur, or point them out if they do; and that same man may have to come out and do staff work in the field next day.

17292. Do you think that a mixture of duties is a good thing, or would you have specialisation?—I think it is necessary to have a mixture of duties. I do not see how they could very well be separated, because in the field courts martial are going on, and there is administration of military law to attend to; and very often it is a great deal more important on service, because martial law comes in too.

17293. But in the other branches men are specialised into sappers, gunners, cavalry, and infantry; would it not be possible to specialise the staff to some extent, too?—It would mean, of course, breaking up the whole arrangement of staff duties, and I am not prepared to say that I think it is advisable. I think if care was taken that the right kind of men came to staff troops that were expected to go on active service first, and were not put in offices in London and that kind of thing, that would meet the case, and things would work as they are very well.

17294. (*Viscount Esher.*) I suppose you approve of some sort of theoretical training for Staff officers?—Certainly. I think the Staff College is excellent.

17295. As at present constituted, you think so?—Yes; I do not know exactly how it is now, but if the same system exists now as obtained under General Hildyard, I think it is excellent.

17296. Do you not think it would be an advantage if you could pass more officers through the Staff College than you can do at present?—Yes, I think it would be a great advantage, because the more that can be passed through the better.

17297. (*Chairman.*) Then as to regimental officers; have you anything to add to what you have said in your summary?—I think regimental officers are excellent. It is sometimes said that they do not show enough initiative, but I find that they show a great deal of initiative if they are let alone. I think very often commanding officers, and perhaps general officers sometimes, do not judge enough by results; they interfere too soon in the work of the junior officers, and that is especially the

case with some commanding officers. When the military training of the company or squadron is going on it is the business of the commanding officer to watch and know exactly what is going on, but not to interfere before a certain point. I do not know whether I make myself clear.

17298. Yes, so that the young officer finds out his own mistake?—Yes; and I think also it upsets him tremendously to be interfered with. If he is pursuing a system of his own in training his squadron or his company, it is as well to let him do it, and to point out his mistake to him afterwards; and it is quite possible that he may attain the result you want in his own way just as well as if he was interfered with every day and told to do something different.

17299. And if he does not attain the result, he will understand where his mistake arose much better if he has worked it all out and failed?—Much better. That is what I cannot get some commanding officers to understand. The fact is they want to do everything themselves.

17300. (*Sir George Taubman-Goldie.*) How can you deal with that?—The only way to deal with that is to remove the commanding officer who shows that sort of spirit; that is the proper way, and to remove him without any hesitation.

17301. Has it been done?—I do not know, I am sure. I think it should be done in such a case. I think much harm is done by interfering in that way. I think we are perhaps rather apt to blame the young officer and not the commanding officer.

17302. I asked that question, because a good deal of theory has been put before us here, and I am rather anxious to know where the practice comes in?—It is the practice I should adopt myself without a moment's hesitation.

17303. (*Viscount Esher.*) I suppose you can exert a good deal of influence in that way now?—I think so. We are trying to encourage that sort of thing. For instance, Sir Redvers Buller always did so. I was under his command at Aldershot, commanding a cavalry brigade, and he was excellent in that way, and a pattern for everybody to copy. He knew every single thing that was going on, but we never heard his voice at all. He never interfered; but he could tell you everything at the end, at a certain time when he chose to make his comments and remarks. We saw he understood everything at the time, and he pointed out the mistakes which had been made.

17304. You mean, he left you to make the mistakes?—Yes, he left us to make the mistakes, and then corrected them afterwards, and he was quite ready to discuss them with us, too.

17305. (*Chairman.*) But in actual warfare did you find any lack of initiative in the junior officers?—No, none whatever on the part of the juniors. I found some lack of initiative on the part of some senior officers, such as commanding officers; not so much with squadron officers, they showed more initiative.

17306. (*Sir George Taubman-Goldie.*) Could that have been discovered in peace time?—I think it should have been.

17307. (*Viscount Esher.*) I suppose that is partly due to the fact that the training of the younger officers has been better than that of the senior officers?—That is one of the main reasons for it, that the reforms did not begin with the seniors.

17308. They began at a date which has rather excluded the senior officers from having the full advantage of them?—Yes, and no doubt it will get better as time goes on. I was trying to get the blame off the young officers, where I think it is unjustly put, and to put it on what I consider to be the right person.

17309. You think, on the whole, the young officers did extremely well?—Extraordinarily well. I think the country has been much indebted to young officers in this war.

17310. And they showed a practical knowledge of their profession?—Certainly. I do not mean to say that they were perfect by any means, but I am sure that the work they had done before, which I know was extraordinarily arduous, assisted them tremendously. I refer to the time when I was in command of the Cavalry Brigade at Aldershot. It is often said that officers care about nothing but polo and hunting. I have known cavalry officers, several of them squadron com-

manders, men with large independent means, men who had horses at Melton and ponies all over the place, who would give up hunting, polo, and everything simply to go and have their squadrons out in the morning, and then go into the barrack rooms and lecture them in the afternoon. I have seen them in uniform in barracks very often at 5 and 6 in the evening, having been working the whole day. That was the kind of work that was going on in the Cavalry Brigade at Aldershot for some time before the war, and I am sure it had a great effect on the conduct of the war afterwards.

17311. (*Viscount Esher.*) You do not see any diminution in that keenness now?—Absolutely none whatever, but we are so often told that up to the time of the war young officers did nothing and squadron commanders did nothing, whereas their profession was the very first thing they thought of.

17312. (*Chairman.*) The next head is supplies, and I do not think I need ask you anything about that; you have stated your views very exhaustively here, unless there is anything more you have to say about the horses, as that is a special point, of course, in your command?—I think that the whole question of supply of horses in war ought to be taken up and thought out, owing entirely to our system of training everything of this kind alone till war actually occurs, the remounts we got were most unsatisfactory.

17313. Do you mean in quality or condition?—I think in both. I think the quality of some of the horses was very bad indeed. They got very much better during the last year or two of the war, the last 18 months, say.

17314. Was that not because they had a longer time after being landed before they were sent to the front?—The actual horse was better, the stamp of horse was better; he was a much more suitable horse for the purpose.

17315. Which sort of horse are you speaking of?—The horses that were sent out, that we got during the last 18 months of the war, received from England, and also some Canadian horses, I think.

17316. Are you referring chiefly to English horses?—Chiefly to English horses, horses that came from England.

17317. Not Hungarian or Argentine horses?—No, I think the English horses were much the best that we got; but, of course, in that country, next to the English horse, I should put the Cape Colonial horse as much the most suitable horse for that warfare.

17318. Was not that a great deal a matter of acclimatisation?—You mean the Cape horse?

17319. Yes, he was accustomed to the climate?—Yes, and I think in the latter stages of the war we knew perhaps better where to find them. They were, of course, accustomed to the country.

17320. Accustomed to the food?—Accustomed to the food.

17321. There was a difficulty in getting horses accustomed to the food, was there not?—Very great difficulty, but remounts were often received in a terrible state.

17322. That was owing to the exigencies of the war, I suppose?—Yes, and the necessity for having horses up and using them at once, which probably could not have been avoided. It was certainly nobody's fault, out there, and I do not believe it was anybody's fault here. I think it was the fault of the system, and that something ought to be done at once to consider the question of remounting mounted troops in war.

17323. (*Sir George Taubman-Goldie.*) Would you say that we had an insufficient horse supply for the original number of troops intended to be sent out, the Army Corps and Cavalry Division?—An insufficient reserve?

17324. Yes?—I certainly think we had.

17325. Insufficient for the wastage of war?—Certainly, we had no reserve at all. We had a lot of reserve horses of a kind, but I do not think that system meets our requirements. We ought to have regular depôts, I think.

17326. (*Chairman.*) You mean keeping horses in depôts?—Yes, on that principle.

17327. More like the principle in India?—In India and in Germany.

17328. (*Viscount Esher.*) Had you any reserve horses in Natal when you arrived there?—None at all.

17329. There was no provision there for the wastage of war?—Not in my time. I was only there a little time.

17330. But still you would have seen it. There was no provision made at the time you left Natal?—None whatever. We were losing horses very fast. I think that the horse power of the whole Empire ought to be utilised and economised.

17331. (*Sir George Taubman-Goldie.*) And organised?—And organised.

17332. (*Viscount Esher.*) When you commanded the Cavalry Brigade at Aldershot under Sir Redvers Buller, was it then clear to you that the system was a bad one?—Absolutely clear.

17333. You knew it before the war?—Perfectly well. We all knew it.

17334. And you knew that you would be face to face with considerable difficulty from such a cause?—Yes, everybody talked about it; for a long time it had been patent.

17335. How many cavalry regiments have you under you at Aldershot at this moment?—Three. The Cavalry Brigade consists of the 18th Hussars, the 13th Hussars, and the provisional regiment of Dragoons.

17336. How are they mounted at the present moment?—They are mounted very badly; they are mounted on cobs practically. I do not complain about that, because it is only incidental to the war, and will be made right.

17337. Has any attempt been made to make it right at present?—An attempt is being made to make it right. A lot of these cobs which were on hand had been sent to the cavalry regiments as horses more with a view to their being taken care of, I think, than anything; there is nobody else to take care of them.

17338. These were cobs not sent out to South Africa which had been bought here?—Yes, they were part of the preparations for carrying on the war, and they were all in the depôts which we had at Aldershot.

17339. And that supply is now being used up?—Yes, but they will be used for mounted infantry as soon as the mounted infantry training commences. We have no mounted infantry barracks yet, and we cannot commence their training until we can put them under canvas.

17340. Then these cobs which you are using now for your three cavalry regiments will be used for the mounted infantry?—They will be used for the mounted infantry, but that is all done from London. I have no power myself over it.

17341. Have you no power at all in that matter?—No, it is all done through the Remount Department.

17342. When your mounted infantry camp is reformed at Aldershot, will it not be in your power to say how many horses you propose to send down, and what force of mounted infantry you propose to train? Is not that within your jurisdiction?—No, it is all laid down.

17343. Do you know whether at the present moment any purchases are being made to replace these cobs you will draft to the mounted infantry?—I do not know. I think some provision is being made. That is entirely a question for the Remount Department. I have nothing to do with it at all. I am only speaking from what I think, and not what I know.

17344. Except that you can complain of the quality of the horses sent you?—Yes, and I am complaining.

17345. What regiment was it that came up here for the 17th?—For the opening of Parliament, do you mean?

17346. Yes?—We did not send any. It was the Provisional Regiment of Hussars from Hounslow, I believe.

17347. They were very indifferently mounted?—The same probably applies to them.

17348. (*Chairman.*) The Veterinary Report which you have put in gives really an illustration of the whole question?—Yes, I think it does.

17349. (*Lord Strathcona and Mount-Royal.*) Do you know of any reason why the bully beef was put up in 7-lb. tins—was there any particular reason for it?—I have no idea, but it is the most inconvenient arrangement that could possibly be made. It is a fatal arrangement for cavalry.

Lieut.-
General Sir
J. D. French
K.C.B.
K.C.M.G.

27 Feb. 1903.

Lieut.-
General Sir
J. D. French,
K.C.B.,
K.C.M.G.

27 Feb. 1903.

17350. It was not because there are seven days in the week, and it was a supply for the seven days for one man?—I have not the least idea. I never understood why it was. I only know that the result was very bad.

(Chairman.) We have had a good deal of evidence about that from the Supply Department, and we were told that the fact was that they exhausted the trade supply of 2-lb. tins, and had to fall back on 7-lb. tins.

17351. (Viscount Esher.) The trade supply is very small, and unless you pay extra the trade will not supply 2-lb. tins; they make 7-lb. tins, which are easily sold, and the result was that the 2-lb. tins ran out?—I see.

(Viscount Esher.) If the War Office would have insisted upon a large supply being kept in 2-lb. tins, and had been willing to pay for it, they could have obtained them. But they would not.

17352-3. (Chairman.) The only other point that I wish to ask one question about is respecting the Engineers—that is, the mounted Engineers. Have you mounted Engineers at present?—Yes; but very few. Not nearly enough; those that exist are normally attached to the 1st Cavalry Brigade.

17354. (Sir George Taubman-Goldie.) You have the pontoon train?—Yes. we have a Bridging Battalion at Aldershot.

17355. (Chairman.) They are not attached to the brigade in peace time?—No. They are included in the "Corps Troops."

17356. Ought they to be so?—I think the field troop which is attached to the Cavalry Brigade should be augmented, and have a large proportion of pontoons in its composition.

17357. It ought to be a regular part of the brigade?—Yes, I think so, certainly.

17358. And more of them?—Yes, more of them.

17359. Especially with a view to operations in a country more like Europe?—I think so, certainly. Bridges have to be thrown and demolitions and all sorts of things undertaken.

17360. Were you delayed at all in South Africa by the want of them?—I think I was found fairly well with them, because I used to improvise people myself. I had a very good mounted Engineer officer with me, Colonel Hunter Weston, the man who blew up the railway in the north of Bloemfontein; he was very clever, and he certainly never left me in want of anything.

17361. That you owe to his energy?—Yes, I think so to a great extent.

17362. More than to the provision made for you?—Yes, I think so.

17363. At the end of your statement you have put the heading of "Efficiency of the Organisation of the Army." What we meant, I think, was very much what you have been dealing with, pointing out anything in which the efficiency was not good and the organisation failed. Have you dealt with all the points of that description which came to your notice during the war?—I think so. I think I have dealt with nearly everything without going into very big questions indeed.

17364. It was not pointing so much to reorganisation as to defects in the organisation which existed?—Yes.

17365. And those you have dealt with?—I think I have dealt with most of them.

17366. (Lord Stratheona and Mount Royal.) Have you made any estimate of the number of Boers opposed to you at Ladysmith in the earlier part of the operations?—At Elands-laagte I should think there must have been some 2,500 opposed to us, not perhaps quite that—perhaps that is rather over it; there may not have been more than 2,000, but they were gradually increasing. I should think, taking the west and the north and the east of Ladysmith, when I left, there must have been 12,000 to 15,000.

17367. They had a great advantage over the garrison from their greater mobility, had they not?—Exactly; but, as I said before, I think that they might have been pushed back more easily than they were.

17368. So that, in short, they were able to be before Ladysmith and again at the Tugela within two or three hours—that is the mounted men; was it not so?—Yes, the mounted men could; the Tugela was only 15 miles from Ladysmith.

17369. Giving them a very great advantage?—That gave them a great advantage, of course.

17370. You never could be sure of the number that you would have opposed to you there?—No.

17371. (Sir John Hopkins.) Have you touched on the Horse Artillery guns?—Yes.

17372. They were of little value?—Yes.

17373. That we have had evidence of?—Yes.

17374. And, of course, you have an idea in your own mind of what you look upon as a good artillery gun?—Yes, I have.

17375. A Horse Artillery gun?—The Horse Artillery gun is rather a thing I am in doubt about. I cannot say I have a good idea whether it is any good taking guns with cavalry at all—whether I would not take pom-poms or machine guns. I am not quite sure about that.

17376. I do not think you have touched upon the value of the lance as a weapon for cavalry anywhere?—No, I have not.

17377. There have been several opinions before the Commission in connection with that. Do you like the lance yourself?—Yes, I would have a certain number of Lancers. I would keep, for instance, the number of regiments of Lancers that there are now, and I would take away the lance from all the others. I would not have the Dragoons armed with the lance.

17378. As a cavalry officer you probably might not enter into the feelings of the colonels of the infantry regiments as to their best men being taken for the mounted corps?—I enter very much into their feelings. I think it is a thing that ought to be considered very carefully. I was a great deal in command of mixed forces in South Africa, and a continual complaint made by colonels of infantry regiments was that their officers were away with mounted infantry and so on. I remember a commanding officer complaining most bitterly to me that he had to do actual subaltern's work, because he had so few officers with him.

17379. (Sir John Edge.) You said with regard to medical services that the medical services were always sufficient, but that some of the Colonial ambulance corps seemed to be equipped more suitably for operating with mounted troops than those sent from England. Which Colonial corps does that refer to?—The Australian. I remember riding in an ambulance on purpose just to try it for half an hour, and I found that they went better over the ground and appeared to be much lighter; it was the ambulance that was brought out under the supervision of an officer whose name I forget—he was an Australian, a very good man.

17380. Was it with any particular Australian Corps? I only wanted to identify it?—I can identify it for you and let you know; I cannot at this moment.

17381. If you would let the Commission know we should like to know it. Did you find that that ambulance stood the rough work well?—I thought so. These particular ambulances that I am talking about were much more calculated to do the rough work of mounted troops than our own.

17382. Then is that the form of ambulance that you would recommend for the British Mounted Service?—I would recommend those advantages to be adopted, but whether it was the actual form I would recommend I am not sufficiently versed in ambulances to say, but I think it had advantages over ours.

17383. Have you been asked to make any report on that subject?—No, I have not. I was very much struck by this ambulance, and rode in it myself, and lay down in it, and tested it also on the march, and I was very much struck with how much easier it rode than the other one.

17384. (Viscount Esher.) Were your signallers who were with you mounted?—I had signallers with me.

17385. Were they always mounted?—Always mounted.

17386. We have had a suggestion made to us by one General Officer Commanding a Division that it would have been a great advantage to him to have had his signallers mounted, so that I suppose it was not usual in all cases?—No, I do not think it was.

17387. But I suppose it would be a great advantage to an officer commanding a Division, or even a brigade, to have his signallers mounted?—My own opinion is that signallers ought always to be mounted.

17388. But no actual steps have been taken, have

they, to institute mounted signallers?—Not so far as I know.

17389. Is that a point on which you would have complete discretion in your Army Corps?—No, that is a great question of principle.

17390. (*Sir George Taubman-Goldie*.) That involves money?—That involves money.

17391. (*Viscount Esher*.) You said you think on the whole that cavalry officers are good horsemasters?—I think they are very good.

17392. Do the young officers have any special training in veterinary work?—Yes, they go through a veterinary course; every young cavalry officer is supposed to go through a veterinary course, and does.

17393. And farriery—do they understand that?—Farriery is included; it is part of the course.

17394. But practically do young cavalry officers know how to shoe a horse?—Yes, I think they do. In every regiment, I believe, it is a matter that is looked to very carefully. In my regiment I know young officers had to go to the forge and do it themselves, and they were passed in it by the veterinary surgeon.

17395. That is not usual, though?—I think it is usual. It is certainly laid down in the regulations that the Commanding Officer should take steps to see that it is done.

17396. Then with regard to mounted infantry, you have not issued any new regulations, have you, for the mounted infantry at Aldershot?—No.

17397. Then the Mounted Infantry Camp is not actually formed, is it?—It will not be formed until about the end of April or the beginning of May, because of the necessity of putting men under canvas.

17398. Are you contemplating any changes with regard to their training?—No, I think they have been trained very well, as well as they can be, up to now, under the supervision of some very good officers—Colonel Alderson and General Hutton—and I do not think their training can be improved upon at all.

17399. So long, I suppose, as there is no change in the actual organisation of the mounted infantry?—Exactly.

17400. And that is not a question with which you want to deal specially?—No, I should not like to deal specially with that unless the whole question came up, and one had an opportunity of really thinking it out. I have my own ideas on the subject.

17401. You know, of course, that one of the principal advantages claimed for this Army Corps organisation is decentralisation?—Yes.

17402. How far do you consider that that is carried in the case of the First Army Corps?—I do not think it is carried far enough. The General Officer Commanding has not a sufficiently free hand as regards finance, for instance, and questions of that kind.

17403. Is there anything you would like to say especially with regard to that?—The powers of the General Officer Commanding to deal with questions involving expenditure are very restricted.

17404. By whom?—By the War Office. For instance, it is laid down, "Except in cases of theft or fraud the General Officer may authorise the writing off of losses, deficiencies, or over-issues of cash not exceeding five pounds, providing recovery presents special difficulty or would cause considerable hardship, or over-issue made through excusable misunderstanding of regulations." I think it absurd to limit the sum to £5.

17405. You think it is too small?—Very much too small; it used to be £1—it has now only lately been increased to £5.

17406. You think a great deal of discretion might be given?—A great deal of discretion might be given, and a great deal of correspondence saved.

17407. Is it mainly in financial questions that you think you are not sufficiently decentralised at present?—There are other questions besides finance in which the General's powers are restricted. He might have more power as regards discipline, for instance.

17408. Can you give an example of that?—It is difficult to give an actual example. My point is, that the General Officer Commanding an Army Corps should be entrusted with full powers to decide finally all questions—whether disciplinary or financial—which arise in his command. Take the case of an officer's conduct being called in question. Such cases have

often to be referred to the Adjutant-General. If they were dealt with by the General Officer Commanding without reference to him, and it afterwards came to the knowledge of the War Office (as it always does through the papers), the General would be asked why he had not referred it; whereas I think a General should be encouraged to give a decision, which should be considered as final.

17409. But taking all the purely military questions as regards the training of troops, the moving of troops, within your own Army Corps district, and points of that kind, have you there an absolutely free hand?—I have not.

17410. Would it be competent to you to move a battalion from one barrack to another without reference to any Department?—Theoretically I have the power, but sometimes when battalions join the command, they have been directed from the War Office to join certain specified barracks. The allocation of ten groups in the command should rest entirely in the hands of the General Officer Commanding. Decentralisation is also not complete as regards grants for military training. May I read this paragraph about special grants for military training, manœuvres, etc.?

17411. If you please?—"The expenditure of above is so far in the hands of the General Officer Commanding that he may allocate the fund in any way he likes, but it is specifically provided that no portion of such sum can be expended in any way not provided for by regulation." When the General Officer Commanding under this paragraph allocated a sum to cyclists during cyclist manœuvres for purposes he considered necessary in connection with the manœuvres, the grant was queried by the War Office as being unprovided for in regulations. The query was subsequently withdrawn on representations being made. That is an example of what I consider to be useless interference.

17412. That again is on the financial question?—Yes, it is; it was simply an example rather bringing out what you meant, perhaps. Manœuvres, of course, do depend upon finance, and whether you are able to do something or not able to do it, and if it is not covered by regulation, and you cannot produce chapter and verse for doing it, you would not be allowed to do it.

17413. (*Sir George Taubman-Goldie*.) Are staff rides dependent on finance at all?—Yes.

17414. So that even in those you have not a free hand?—Yes, I have; they are provided for by regulation.

17415. So that you could extend those to any extent you please?—I could not extend them to any extent I please. I am limited by the sum placed at my disposal for the purpose.

17416. (*Viscount Esher*.) Would you then be checked or restrained to a certain extent by the amount you have to spend on staff rides?—Yes, I would.

17417. Have you a special sum allocated to you?—Yes.

17418. And within the expenditure of that sum have you complete discretion?—No. As I stated in the case of the cyclists, if I spend any sum in a manner which is not exactly covered by some specific regulation, the sum spent will be queried, although it is spent entirely in connection with the operations in question.

17419. You have a financial officer at Aldershot?—Yes, an Auditor.

17420. Is he only an Auditor?—He is only an Auditor.

17421. Do you refer questions to him beforehand as to whether you can or cannot spend money?—Yes, continually.

17422. Does he report independently of you to the War Department?—He can if he likes, but he is obliged to furnish me with a copy of what he says.

17423. He corresponds direct with the Financial Secretary then, does he?—No, with the Accountant-General.

17424. But he has to submit to you a copy of what he sends?—He has to submit to me a copy of what he sends.

17425. Do you consider that he is under your command?—No. He is the representative of the War Office authorities in the command.

17426. Has he a large staff attached to him?—He has one principal assistant and 14 or 15 junior clerks under

Lieut.-General Sir
J. D. French,

him. I can read you the original Order when he was appointed a year and a half ago.

17427. If you please?—“(1) The Army Corps Auditor will be the representative of headquarters in the command. He will carry out locally the audit of all the accounts of the Army Corps, and will record the expenditure in the command. (2) The Auditor, as the representative of the Accountant-General, is empowered to inspect the accounts of any paymaster, accountant, or sub-accountant in the command, and any records on which money claims are based. Whenever as the result of such inspection an official report is made by the Auditor to the Accountant-General, a copy will be furnished to the General Officer Commanding. (3) All claims, even if exceeding £100 in amount, will, except as provided in paragraph 5, be examined and paid by the District Paymaster,” and so on. “(4) All cash accounts referring to the financial year 1902-3 and all supply and store accounts rendered to the War Office after the 1st of April, 1902, will be rendered to the Army Corps Auditor for local audit. (5) Until further orders no change will be made in the present practice as regards the payment of claims for Engineer services; those under £100 being paid locally and those of £100 and upwards being paid at the War Office, or as regards the rendering and audit of accounts for such services, except that the Engineers’ stores accounts and rent accounts will be rendered to the local Auditor and audited locally.” That is the original Order.

17428. You see there he is spoken of as the representative of the Accountant-General?—He is the representative of the Accountant-General. He is not practically under my command at all.

17429. But he does not merely fulfil the duties of an auditor, because you would probably send for him, would you not, if you had any doubt beforehand as to whether you were, or were not, justified in certain expenditure?—Certainly at once.

17430. Do you remember what the sum is that is allocated to you to spend in your command?—This year £60,000, of which sum £40,000—I am not quite certain whether I am right in the sum—two-thirds of it at least has to be kept for big manœuvres, which are to be held for a few days in September under the superintendence of the Commander-in-Chief.

17431. Taking that two-thirds, would you have a discretion as to how you would expend it?—It is to be kept entirely for manœuvres. I should have no discretion at all. I should have to use it as I was ordered to use it. Manœuvres would be under the superintendence of the Commander-in-Chief.

(After a short adjournment.)

Major-General Sir BRUCE M. HAMILTON, K.C.B., called and examined.

Major-
General Sir
Bruce M.
Hamilton,
K.C.B.

17448. (Chairman.) I am not quite sure at what point you went out to South Africa?—I went out on General Clery’s staff as Assistant Adjutant-General.

17449. To Natal?—Yes.

17450. Were you present throughout the operations in Natal?—Until a month after the relief of Ladysmith.

17451. And then you went round?—I joined Lord Roberts at Bloemfontein and got the command of a brigade.

17452. And after that you commanded a brigade?—I commanded a brigade to the end of that year, and then I got the command of some mounted columns, and I had various commands then until the end of the war.

17453. You have been good enough to prepare some notes on the memorandum (*Vide Appendix, page 575 post*) which we submitted to you. The first head was with regard to the adequacy of the forces?—Speaking generally, the forces were adequate in strength to the work they had to do. As regards the commencement of the war, this refers only to the troops in the field about the time of Colenso, and after that date. At this period of the war the want of mounted men was greatly felt. Infantry were not sufficiently mobile to take advantage of their numbers against the mounted Boers. Had there been a force of 6,000 mounted men capable of moving for

17432. And you could not draw upon that two-thirds in any case for any other purpose?—No.

17433. With regard to the other one-third, how far does your discretion go there?—I must be covered by the regulation in what I do.

17434. Is that one-third ear-marked at all?—Yes.

17435. It is all divided up into a sort of subheads, so much for this, that, and the other?—Yes.

17436. Would you have the power of transferring a sum from one object to another without reference?—I may allocate the sum amongst the subheads, but I must not go outside them.

17437. Then you do not consider that at present the decentralisation which we have heard so much about is as complete as it might be?—I do not think it is.

17438. (Lord Strathcona and Mount Royal.) May I ask if you had any opportunity of forming an opinion of the medical service and ambulance corps of the Canadian contingents?—No, I had not.

17439. (Sir George Taubman-Goldie.) You mention manœuvres. I should like to ask whether you consider that you have sufficient manœuvring ground, and suitable manœuvring ground in your command?—No.

17440. Is it possible in this country, in England, to find suitable ground?—I think it might be by extending the Manœuvres Act, but it is very difficult.

17441. And as regards Ireland?—It would probably be easier to find suitable ground in Ireland.

17442. Do you know the West of Ireland well?—Fairly well. I have hunted there a great deal some years ago.

17443. Might it not be possible to find suitable manœuvring ground in the west of Ireland?—I think it might be very possible; it is all a question of money.

17444. It would be much more easy to find manœuvring ground there than it would be in England?—I should think it would.

17445. The compensation claims, too, would be much smaller than on this side?—Yes, I suppose so.

17446. I was asking with reference to further manœuvres by other Army Corps?—Yes, I should think perhaps it would be easier and less expensive to find ground in Ireland than in England.

17447. (Chairman.) Is there anything else that you wish to add to your evidence?—No, thank you.

three or four days without baggage the operations would have been very different. In the latter stages of the war the numbers were sufficient, but increased numbers would have produced quicker results.

17454. You mean that to Sir Redvers Buller’s force a mounted force of 6,000 men would have made a great difference?—Oh, yes, because it could have gone round independently.

17455. (Sir George Taubman-Goldie.) Gone round where?—Potgieter’s Drift, for instance. They could have gone on one night and occupied the ground on the far side of it, and I think 6,000 men would have been sufficient to hold their own. The infantry could have been there the same day. They would only have had to hold it for a few hours, and even if there had been 10,000 Boers against them I think they would have done very well.

17456. (Chairman.) But without the mounted men the Boers were too mobile?—The Boers could always see us coming; they always knew our movements, and could be there before us.

17457. Is the movement you refer to the same sort of movement as that of Dundonald round by Acton Homes?—Yes, but I think it might have been much wider if we had been stronger, and we could have taken greater risks.

17458. In the later stages of the war the deficiency of mounted men was less marked?—Of course, we had nothing but mounted men at the end of the war; the

Major-General Sir
Bruce M.
Hamilton,
K.C.B.

27 Feb. 1903.

infantry were only used for the lines of communications, and the protection of baggage. We fought then entirely on the lines of the Boers, but it does not do to assume that every war would be the same as this. Still, I think that any side which has a large number of mounted men would have a very great advantage, and I have no doubt from our experience in the Transvaal that we have the means of forming a large force of mounted men that no other country has.

17459. As to the mounted men in your column, they were principally Irregulars, I suppose?—Regulars and Irregulars. I had lots of cavalry and Yeomanry, and Colonials—Cape Colonials and Australians.

17460. (*Viscount Esher.*) When you speak of that force of 6,000 mounted men, which you would have been glad to see in the earlier stages of the war, are you speaking of an infantry soldier on horseback, or are you speaking of cavalry?—For the Boer war I think the infantry soldier would have been equally good; in the Boer war we practically used them all for the same work, and there was no difference.

17461. I am speaking of that 6,000 men you say you would have liked to have had in the early stages of the war; would you have preferred an infantry soldier on horseback, that is to say, a mounted infantry man, or would you have been satisfied with cavalry for that particular purpose?—I would have preferred mounted infantry, because I think they would have been steadier; it would have been holding a position against attack when they got there.

17462. (*Chairman.*) The second point is as to the quality of the men?—The shooting of the Regulars was good, although inferior to that of the Boers, and capable of great improvement. Some Colonials shot well and some indifferently. The second lot of Yeomanry knew nothing at all; they did not know how to handle a rifle at the commencement. The marching capacity was good. The infantry always did what was required, and I believe could have done longer distances. It was very often a question of boots. On our way up to Pretoria there was great difficulty very often in getting enough boots, and we often had to leave men behind because they had worn through them. The Brigadiers had to arrange, and I had to arrange myself, for the supply of boots very often, to send an officer off to bring them back, and the brigade which happened to get the most boots could go on marching the furthest, but the marching was very good, I think, all through. It does not compare as regards distance with the marching of Continental armies, and the Continental Powers seem to be able to get their men to march longer distances, but I think our men are really just as good. I do not know how the authorities of the Continental armies manage it; perhaps they train them up just for their manoeuvres, and do tremendous distances for a short time, and I think they push them more. I think if we marched our men so far as the Continental countries do at manoeuvres it would affect recruiting.

17463. (*Sir George Taubman-Goldie.*) Do you think our men are as well shod as the Germans?—That I do not know.

17464. Have you ever seen the shape of the German shoes?—They seem to wear a kind of Wellington boot.

17465. I refer to the shape of the feet?—Yes, I dare say that has a great deal to do with it. I have been quite surprised at foreign manoeuvres to hear the distances they have gone, but still I think our marching in South Africa was very good.

17466. (*Chairman.*) Is it not one thing to march at manoeuvres and another to march throughout a campaign?—Quite a different thing. Then, as regards the horsemanship, the horsemanship of regular cavalry was good, also of some Colonials. The others soon could ride well enough. The mounted infantry were often quite unused to riding, but after a period of two or three weeks became fairly efficient for the purpose required. They should be able to mount and dismount quickly, and ride at a fair pace over rough ground. They should also have some training in the care of horses, in the treatment of sore backs, and in fitting saddles.

17467. (*Viscount Esher.*) Is not that a very important point for a mounted infantryman?—I think so—a slight knowledge. When we took numbers of men straight from the regiments, who did not know anything about it at all, they were quite indifferent. They did not under-

stand that they might lay their horses up for three weeks if they were not careful about putting the saddle on, and I think it very important, but sufficient instruction is not very easily given.

17468. But it is important that a mounted infantryman should be trained not only in horsemanship, but in horsemastership?—Yes. Horsemastership is very much a question of discipline. The artillery and cavalry were much better horsemasters than the auxiliary troops. The artillery system is excellent. As to cover, the men had not been taught sufficiently the value of cover, but they soon learnt it during the early part of the war. Regiments which had been on the Tugela would at once entrench themselves on getting into camp, and the men worked voluntarily when they realised the security it gave them. All entrenchments should be such that a man is comfortable in them, and has protection from bullets, and can fire without exposing his head. Entrenchments of outposts should be a matter of drill, and never omitted when the ground is available. The general physique and morale of the men was excellent, and their fighting capacity could not be excelled, but their intelligence was not equal to that of the enemy, nor to that of many of our irregulars. Even at the end of the war the men were not at all observant, and the private soldier was easily caught in a trap by the Boers even quite at the end of the war.

17469. (*Chairman.*) We have had some evidence that they improved in intelligence very much during the war; is that not your experience?—They did get sharper, but I think their intelligence was always inferior. They were not anything like so well educated, and they were not anything like so good as regards intelligence as the Boers, or as some of the Colonial troops.

17470. For instance, it was put to us that the force which marched into Ladysmith at the time of the relief was as good a fighting instrument as you could get—that, taking it all round, as a fighting machine your force which went into Ladysmith after all the battles on the Tugela, had developed into as good a fighting machine as you could wish to see?—I think it was a very good fighting machine, certainly.

17471. (*Viscount Esher.*) Is not that rather for dogged fighting than for the sort of work you were doing with your columns at the end of the war?—Yes. I think at the beginning of the war it was necessary to start according to our pre-conceived ideas of Continental warfare. We could not be expected to start straight off according to the system of the Boers.

17472. But for the sort of work you were doing at the end with your columns, did you not require a higher degree of intelligence than was required for the style of fighting on the Tugela?—Certainly more individual intelligence. I think for the style of fighting at the beginning of the war a more carefully worked out system and officers who understood the system thoroughly was wanted.

17473. (*Sir George Taubman-Goldie.*) At the end of the war you were carrying on a guerilla war as the Boers were?—Yes, and everything depended on the individual much more, and the individual commander more, and it did not depend so much on the system—it was not so much the work of a machine. The most important point as regards the training of the men is to improve their shooting, and greater facilities for voluntary practice should be given than exist at present. When ranges are near the barracks the shooting of a regiment improves. The difficulty in obtaining the use of a which is not compulsory. Sites for long ranges are hard range, the distance to go, the expense of getting there, and of buying ammunition, prevent almost all practice to find, but short ranges could be made in most places. This should be done near all barracks, and ammunition issued at a nominal charge. Good shots at short ranges would soon shoot well at long, and the shooting in the Army would rapidly improve.

17474. 500 yards—300 yards?—I think 300 is quite enough.

17475. You think that if a man can shoot well at 300 yards he picks up the other easily?—I think if a man is a good shot at 300 yards he would very soon shoot very well at any other range.

17476. That would solve the range difficulty in England?—Yes. I went down the other day to a depot and found the sergeants going down to a shooting match. It took the whole day to get there and back, and they said, "We would go every day if it did not cost so much." They had to have a drag to take them

Major
General Sir
Bruce M.
Hamilton,
K.C.B.

27 Feb. 1903.

there, and that is always the case. I think a great many officers will agree with me upon that point as to short ranges close to the barracks. Of course it is expensive, but I think it is worth an Army Corps.

17477. (*Chairman.*) How did our shooting compare with the Boers?—The Boers were much better shots I think. I think they were more ready, and more accustomed to field work. Some of our men shot very well.

17478. Was it not the same case with the Boers—that some of them shot very well?—Yes, they did vary, but, as a lot, they were much better than ours. If we got a small commando we found that a larger proportion—it is very hard to tell exactly, but I think a much larger proportion—of them would shoot well than of our men, because a far larger proportion were more accustomed to outdoor work and life on the veldt.

17479. There is a certain amount of difference of opinion apparently upon that point from the evidence we have received?—I think British officers are very anxious to stick up for the shooting of their men, but there is no doubt at all that our shooting could be very much improved if the men had plenty of practice.

17480. (*Viscount Esher.*) Was it not very difficult really to judge of the shooting of our men?—Yes, it was.

17481. Because you so seldom saw a mark?—Yes, it is hard to give a very decided opinion.

17482. (*Sir George Taubman-Goldie.*) A belief was stated here by one of the witnesses that the Boers for the most part held their rifles up over the trenches so as to keep their heads covered, and fired; do you agree with that?—No; I certainly do not. They were very good at making themselves safe.

17483. Of course this witness stated there were some marksmen among the Boers who were excellent; he was speaking of the majority when he stated that belief?—Well, there are many officers who may have had more opportunities of seeing. I will not say it is impossible that in some commandoes they did that, but I think, taken generally, the Boers were very good shots. I do not think they were so plucky individually as our men, and if they were at all near our fire, and it was pretty warm for them, I can quite imagine their doing that, although they were good shots, but if they were in a safe place, as they very often put themselves into (they generally put themselves on the top of a hill, and if they saw numbers coming, went off pretty quickly), then I am sure they shot excellently. Another point in regard to the training of the men is that the strength of the company should be increased. Companies of infantry are now so weak that officers lose interest in the training of so few men. They see hardly any men on parade, and the captain of a company, who has served 15 or 16 years, becomes disappointed. My experience is that if officers and non-commissioned officers are well trained, a comparatively simple course is sufficient for the men. In May, 1901, I had nearly 3,000 of the new Yeomanry to organise and train.

17484. (*Chairman.*) That is the Second Contingent?—The Second Contingent. In some regiments I was able to pick out the officers and non-commissioned officers that happened to be immediately under my own control, and when I was able to do that all those regiments rapidly became efficient; other regiments remained almost useless up to the end of the war, because they had not good non-commissioned officers and officers. I believe that good schools of instruction are very useful for the education of non-commissioned officers, but they should be very carefully organised and managed by specially selected officers. The Swiss schools are excellent, and their course of instruction well thought out. The course of instruction in ours is not, I think, so good. As regards the training and selection of officers, the most difficult question is the selection and advancement of the most efficient officers. Young officers should be able to see on entering the Service that if they make themselves efficient their prospects will be improved. At present there are few inducements to work, and a young officer, if he fulfils the requirements of his commanding officer, is promoted by seniority without regard to his efficiency or the reverse. Field sports should be encouraged, and young officers induced to improve themselves voluntarily rather than by forced work. Promotion should be by selection.

17485. Even in the junior ranks?—Yes, I think it ought to be by selection in the junior ranks; but, of course, you cannot be quite so certain while a man is a

junior, and you could not select so deeply among the subalterns.

17486. (*Sir George Taubman-Goldie.*) Who would select?—I think the Commanding Officer and the local General. I think that the promotion up to the rank of major ought to be in the hands of the General under whom an officer serves. The Commanding Officer's recommendation of a subaltern, be the Commanding Officer good or bad, will be to the best of his ability; if the Commanding Officer is asked to give his best officer he will conscientiously try to give him, and he will very often, if he is not a very good judge himself, be influenced by the opinion of the regiment, and the officer chosen will be the officer who is recognised as the best.

17487. (*Viscount Esher.*) Do you not think some consideration ought to be given to the amount of effort which a young officer makes?—I was coming to that; I think that a system might be introduced of giving rewards of two years' substantive seniority on certain lines: as a reward for active service, to Adjutants who have done well, to officers who distinguish themselves at the Staff College or elsewhere, to subalterns who have taken honours in a professional examination after two or three years' service somewhat similar to the Navy.

17488. You could do that under the present system without actually having an examination by taking into consideration how a young officer does in the military courses through which he passes. If a young officer goes in for a course of musketry, we will say, if he does exceptionally well, he is classed when he comes out, is he not?—Yes.

17489. If you were to take into consideration the way he performs when going through these various courses it would obviate the necessity of having a special examination?—Yes, if the way he passes through his examinations for promotion in theoretical subjects is taken into consideration.

17490. But the examination for promotion is rather a farce now?—I mean if the examination was made a second test.

17491. The point I put to you is that in order to obviate any special kind of examination, could you not, under the present system, even promote the best subaltern by taking into consideration how he does in the courses through which he actually passes—musketry and engineering, and so on, which are voluntary courses now with the exception of musketry?—I think so, but I think the examinations ought to be such that they would be a good test.

17492. You would prefer a more stringent examination for promotion?—Yes, for the young officer; I think it is a great thing to make them work. You want men who are capable of work. One does not believe in examinations entirely, but it is a great deal to get people who have the power to work and who will exert themselves.

17493. Do you not think when it comes to examinations there is always a risk of cram?—Yes, there is, certainly: I agree about that.

17494. And in that way you may not always get the most highly qualified officer; some men, as you know, have a much greater capacity for cramming than others?—In the Navy you find men who take honours at Greenwich—I am not quite sure about this, but they take three or four firsts.

17495. They go to Greenwich to a regular Naval School, and that is rather different?—Also at the gunnery Island at Portsmouth; if they take a first at gunnery it helps their promotion.

17496. You are quite right, only it is rather different from anything in the Army; would you suggest that young subalterns should be sent to a military school at a certain stage in the same way that these young Naval officers go to Greenwich?—What I should like is a good professional examination, theoretical and practical. I do not think the present system of courses provides sufficient test, nor are they in the subjects which it is most important for an officer to study.

17497. Do you not think there would be some advantage in making all these courses compulsory instead of voluntary? Take the signalling course; no young officer is now bound to go through the signalling course, and it is voluntary; do you think that that voluntary system is advantageous, or would you make all these

courses compulsory for young officers?—I would not make them all compulsory.

17498. (*Sir John Edge.*) Would signalling be a course which would be necessary for every officer in the Service?—Signalling was very useful in South Africa, but I do not think it is necessary for every officer.

17499. I suppose if you were a little stringent in the field examination you would get a very good estimate and be able to judge whether the man who had passed the book examination had crammed or not?—I am rather in favour of a theoretical examination for youngsters.

17500. You mean a purely theoretical examination on paper?—In addition to the field examination.

17501. I am not disputing that at all; I say the field examination would enable you to form a judgment as to whether the man had scored high by cramming or not?—Yes, I think it would.

17502. You could always test it?—Yes, and even allowing for cram, I think, a good examination does find out intelligent men. Examination honours is only one of several ways I have suggested by which young officers could gain advancement.

17503. (*Sir George Taubman-Goldie.*) Apart from the courses, are you in favour of leaving a great deal to the selection of the Colonel?—Among the subalterns, yes.

17504. Would you insist on the Colonel being a celibate?—No.

17505. How are you to avoid favouritism?—There might occasionally be a little favouritism, but the general result would be satisfactory.

17506. Cæsar's wife is not always above suspicion?—Still, it is wonderful how conscientious men are when they are selecting in the regiment.

17507-8. (*Viscount Esher.*) There is always the public opinion of the regiment?—Yes, I think that would keep it in check.

17509. (*Sir John Edge.*) You think you could trust the Colonel so far as the promotion of the good of the regiment was concerned?—Yes.

17510. But would you be quite so certain if the Colonel was applied to for a man for another service, say for an Adjutancy of Volunteers, for instance, that he would send you the best man?—I think if the Colonel was asked for his best man in such a way that it would be to the officer's interest to be selected, he would always try to select his best man.

17511. You mean that you think you could always trust the Colonel to select the best man and send him out of the regiment for five years as Adjutant of a corps of Volunteers?—I think that the nomination of the Colonel, under the supervision of the General, is the best thing that can be done.

17512. (*Viscount Esher.*) Anyhow, you think that there is not a sufficient incentive now for a young officer to take a great deal of trouble in his profession—is that your point?—That is so.

17513. There is not enough incentive, and some incentive should be invented or created—that is your point?—Yes; of a definite reward as regards his prospects.

17514. (*Chairman.*) Did you find any difficulty in the war in consequence?—It was always very hard to find out which were our good officers; they did not know exactly, and I think we had not been trying always to find out. I think if we were to substitute this system of giving two years substantive seniority for the reward by brevet, by the time an officer became a Major he might possibly have received three of these rewards, and a large number of Majors might have got one of them, thus making a better class to select from than exists at present. This would also enable efficient officers to come to the front, even if they had not had the chance of going on active service. Until the South African war the choice of Generals was limited to those who had been lucky enough as youngsters to go to some small war—because the only promotion that could be obtained at all was by getting a brevet for active service, and it could not be got for anything else but active service. The present system of reward by brevet produces false situations, and is very irregular in its effect, giving some men eight years advantage and others none at all. Many good officers now leave the Army because they have no prospects, who would remain if they saw a chance of advancing themselves by proved efficiency. The quality of our officers was excellent, but owing to defects in our system of selection and training

the best regimental officers were not at the top at the commencement of the war, and the want of leaders ready to take responsibility and risk was often felt.

17515. (*Viscount Esher.*) What was the cause of that?—I think we had not a sufficiently high standard for regimental commanding officers.

17516. We heard there was great difficulty in finding column commanders towards the end of the war who were efficient?—There was a difficulty, but there was a very large number of columns. I should think there were nearly as many small column commanders at the end of the war as there were regimental commanding officers at the commencement. These small column commanders were up to a very good standard, and this shows that the men were there.

17517. When you say those officers were disinclined to take risks, was that from inefficiency in some cases, or were there any other causes at work?—I think it was principally from inefficiency.

17518. Do you think the fear of being dealt with rather summarily and drastically in case of failure had any effect in weakening the initiative of commanders of columns?—I would not say that. I think that the men that had initiative would take the chances, provided they felt they would be reasonably supported.

17519. Did you hear of any cases where officers who had done well up to a certain point in the war rather shrank from responsibility towards the end?—I cannot remember; no doubt there were men who did not do so well after a long time, and I suppose the continued strain had some effect upon them, but I cannot think of cases which meet exactly your question.

17520. However, I suppose it was generally understood, was it not, as the war came to a conclusion, that if a mishap occurred to an officer in command of a column he would be superseded?—It was not invariably the case.

17521. I know it was not invariably the case, but was not that rather the feeling among officers in command of columns?—Yes, I daresay it was, or rather I would say they felt they would be superseded if not considered efficient. This was the usual reason why men were superseded—not for mishaps. I refer to the latter part of the war.

17522. Do you not think that would be rather inclined to make a man shrink from taking a big risk?—I think he ought to feel that he would not be superseded unless it was considered he was to blame, because you may have a mishap which is not your fault.

17523. Do you think that was the feeling?—I do not think that fear had a very great effect as far as my judgment goes. It is very hard to tell. I think that an efficient man would have proved himself an efficient man in spite of the fear of being superseded in case things went wrong.

17524. (*Sir John Edge.*) He would take the risk?—I think so.

17525. He would do his duty and take the risk?—I think so. It certainly does make a difference to an officer whether he is trusted or not; I quite agree about that. If a man feels there is a doubt about him that might cramp him. No doubt subordinates should be made to feel they will be fairly treated, and their difficulties considered.

17526. (*Viscount Esher.*) Did you have to work much in conjunction with other columns?—Not much. I think I know the point you were going to put, and I think that columns working in the same district should be placed under command of the senior officer, and not merely told to co-operate.

17527. (*Chairman.*) What is your next point?—With regard to the present system of training officers in the various arms, that of the artillery appeared to me excellent. The junior officers rarely, if ever, left their own particular sub-division of their unit, and were absolutely responsible for it both in the field and in camp, whereas subalterns in the cavalry and infantry are always liable to be removed to another squadron or company, on account of the seniority in their regiment. The squadron organisation is good, but should be more self-contained. The infantry subaltern has never had a command of his own within his company; he is merely the Captain's assistant, and has no responsibility such as the subaltern officer of artillery. He is constantly away from his own company temporarily commanding another, and therefore lacks the training which a definite command and definite responsibility would give him. If infantry battalions were organised on the same lines as artillery and

Major-General Sir

cavalry, it would be possible to give the senior officers of a battalion a command suited to their standing and service, and would enable the responsibility for the training of the men to be thrown on the company commanders. If battalions were organised in four large companies instead of eight small ones, each company having an establishment of one Major, one Captain, and a subaltern for every 50 men of establishment, then the commander would be absolutely responsible, and each subaltern would have his definite command and responsibility. Officers should never be shifted from one company to another unless under very exceptional circumstances. In the absence of a subaltern the section should be commanded by the senior non-commissioned officer. The senior non-commissioned officer of the company could then be employed as a field instructor, and the pay and clothing duties could be carried out by another non-commissioned officer as company quartermaster-sergeant. If it could be found practicable to make the company and squadron a self-contained administrative unit, as in the case of a battery of artillery, so much the better. As regards the training of staff officers, an organised system of selection and training for staff officers should be introduced. At present a proportion of our staff officers receive a certain amount of staff training at the Staff College, but as soon as they are appointed to the staff their principal work is the routine and discipline of the Army, which has little to do with their work in war. Also a considerable proportion of our staff officers have no technical staff training at all, and officers without and previous staff training whatever have sometimes been put in important staff posts. The result is that a very confused idea prevails as to what is required for staff work and as to its distribution. This was specially noticeable at the beginning of the war. The staff should be divided into two branches: (1) Those who prepare the Army for war; (2) those who carry out interior economy and discipline. This division of work was made on the Headquarter Staff at Pretoria. The former should be carefully trained, and of proved ability, so as to ensure their all being up to a certain standard of intelligence, and also that they are conversant with certain fixed principles as to the maintenance and movements of troops. In peace time the most urgent work is often routine and discipline, and unless the above division is made a busy staff officer is often obliged to neglect the more important work of training the troops for war. I think some of the best Staff College graduates should go as instructors at Sandhurst for a couple of years before appointment to the staff. This would enable them to digest what they had just learnt at the Staff College. Ambitious and rising instructors would foster the proper spirit among the cadets, and have more influence with them than any other class.

17528. Had you any difficulty in getting an efficient staff?—I had a very efficient staff.

17529. You had no difficulty in getting it?—I had no difficulty myself; the selection of the staff lies entirely in the hands of the Commander-in-Chief, and I was very fortunate in having a very good staff.

17530. Staff College men?—No, they were not all Staff College men, but I think they would all have been better for being at the Staff College. Of course, the technical training did not come in so much towards the end of the war. It would have been much more important, I think, at the beginning of the war, where we were engaged in divisions in regular organisation. I think manœuvres are very important, and that we should have them every year; they should be a regular part of our training, and the money for them always included in the estimates.

17531. (Sir George Taubman-Goldie.) Have you served in Ireland at all?—Never.

17532. (Chairman.) You next refer to supplies?—The supplies were satisfactory. As to the horses, they never came up to requirements in quantity, and their quality left much to be desired. The great waste in horse flesh was no doubt due to the fact that it was impossible at any time to fully mount up any unit with horses in hard condition, and fit for work. It was constantly necessary to use weak or unfit horses which a long day's work would render useless for many weeks. Every endeavour was made to classify them as (a) horses fit for work, (b) fit for slow work, (c) unfit for work. But the necessity of taking out troops in sufficient numbers interfered with this. The Engineer services were excellent, and they had a very good system of employing natives, mounted on Kaffir ponies, with the field detachments, to do digging and general labouring work. I think it would be a very good thing to

have a large force of mounted infantry, and that we ought to keep up the cadres in peace time of regiments of mounted infantry; that is, the commanding officer, adjutant, and a few staff sergeants, and pass the men through, so that directly we go to war we can at once expand them into so many regiments of mounted infantry. It would be a little more expensive than the present system, but a defect of the mounted infantry in the war was a want of discipline, and that would be obviated a good deal by having the regimental staff ready. Directly the men became mounted infantry they seemed to deteriorate in discipline.

17533. They were away from their own regiment?—Yes, in a regiment of mounted infantry there were four companies, each from a different regiment. Even companies were not always formed from one regiment, and there was no regimental system.

17534. (Sir George Taubman-Goldie.) Are you rather in favour of permanent corps of mounted infantry as opposed to the system of drawing the best men away from the battalion at the critical moment?—I do not think enough men to form permanent corps can be kept up, and I think three months' training is sufficient.

17535. But the disadvantage has been put before us of the regiment, at the critical moment, losing its best men just when they are wanted the most; their best shots, their best officers, and their keenest men. What do you think of that?—It is no doubt a great disadvantage to the regiment, but I think such a much larger number of men can be got by drawing in that way that it is a very great advantage to the Army as a whole.

17536. Practically you would like to see the whole of the infantry trained as mounted infantry in turn?—A large number; I once mounted a whole infantry regiment, and they had only the same proportion of mounted infantry as other regiments at the beginning of the war, but they very soon became quite as good as the other mounted infantry, and much better as regards discipline and interior economy.

17537. (Chairman.) Have you anything to say about the guns?—I had rather a good idea of the field gun; it had not so long a range as the Boer gun, but it did much more damage.

17538. You are speaking of the field gun, not the Horse Artillery?—It is the 15-pounder I am talking of; the Horse Artillery guns were not so long range.

17539. Could you move the 15-pounder quick enough for your purposes as a mounted column?—Yes, I took double teams; I used to leave a lot of things behind and take double teams for the guns, so as to make a long march more easily.

17540. Had you any of the heavier guns with you?—I had a couple of these 12 cwt. 12-pounders, naval guns, and they were not so mobile, and they would stick much oftener, but they got about in a wonderful way.

17541. They would be more suitable to go with infantry?—Yes. They are capital guns, and would not delay infantry.

17542. (Sir George Taubman-Goldie.) They kept you back to some extent, I suppose?—It was only an improvised carriage, but they were heavier for going about, and they were not so certain to get through. I took the others for choice when I was going on a long march with mounted troops.

17543. In such a case the length of range is not quite such a vital matter as mobility?—No, not quite.

17544. We have had a good deal of evidence that an extreme range was not of very great importance?—During the latter part of the war the Boers had no artillery, and therefore there was no very fair means of judging. If you cannot shoot as far as the enemy the moral effect is bad.

17545. Going back to the earlier part of the war, did you attach as much importance as the newspapers did to the extraordinary range of the Boer guns?—The Boers out-ranged us there is no doubt, but their long range guns that did much damage were heavy guns. Their light guns did little damage; they had a 9-pounder Krupp which threw a shell a long distance, but it hardly ever did any harm.

17546. It was only their guns of position which were very effective?—Their heavy guns were very effective.

17547. As guns of position?—Yes, but they managed to move them about much more than we did.

17548. (Chairman.) Is there any other point you would like to mention?—No other point.

APPENDIX "A."

REPORT ON SUPPLY SERVICES WITH CAVALRY FORCE. (May 6th to May 31st, 1900).

(Handed in by Lieut.-General Sir J. D. French, K.C.B., K.C.M.G. Vide page 301.)

Bloemfontein to Kroonstad.—May 6th to May 12th.

Rations Issued.—The 1st, 3rd, and 4th Brigades left Bloemfontein with four days' supplies at full field service rates. The 1st and 3rd Brigades replenished at Vet River; the 4th Brigade wagons halted to fill up, but as this Brigade pushed through without halting for one day on May 8th, as did the others, its wagons did not come up until May 13th in Kroonstad. The 3rd Brigade accompanied Army Headquarters, and have not been with General French's force since that time. The 4th Brigade took two days' supplies from its wagons at Du Preeze laager on May 10th. During the action that day the whole baggage and supply train fell behind with the Mounted Infantry, and did not overtake the column until 13th May, in Kroonstad. Thus the 4th Brigade was out of rations on May 11th, the 1st on May 12th. A sufficiency of flour was obtained at Rodepoort to feed the men of the 4th Brigade on the 11th, and plenty of oat hay and mealies for the horses of both brigades. On May 12th two days' complete rations for both brigades was purchased in Kroonstad.

Fresh Meat.—There was a large number of sheep and cattle in the country; the whole force has had fresh meat during this and at all periods of the operations.

Receipts.—Receipts were given for all supplies taken from inhabitants. Payment was not made, as in every case the actual owners of the farm were bearing arms against us.

Halt at Kroonstad.—May 12th to 26th.—As experience proved it was impossible for a divisional supply column to overtake Cavalry on the move. The General Officer Commanding issued instructions that the Brigade supply column should be doubled, making 24 wagons in each, and that the force should move with five days' forage and nine days' biscuits and groceries distributed as follows:—Three days' biscuits and groceries and two days' forage on horse, two days' biscuits and groceries and one day's forage in regimental supply wagons, four days' biscuits and groceries and two days' forage in Brigade supply wagons.

Owing to the difficulties of obtaining supplies from the base, the force has never been able to obtain more than half this amount at one time. On Saturday, May 19th, every available wagon with the force was ordered to Holtfontein siding 14 miles south of Kroonstad to fill up, then to come up to Rhenoster Kopje, meeting the column there.

Kroonstad to Johannesburg.—May 20th to 30th.

Two Days' Supplies.—The force marched with two days' rations for man and horse on the saddle. On the 21st the supply column met it at Welgelegen with four days' for man and horse.

Welgelegen: Three-quarter rates.—On the 21st the force was on half rations, which was increased to three-quarter rates for the men on the 22nd, and 10 lbs. for the horses.

This rate has continued up to the present time, and has been in force throughout the Army. From May 28th the ration for horses has been reduced to 5 lbs. per horse; this has been fully supplemented by oat hay and mannah hay obtained from the country.

Mealies.—Mealies could also be issued for English horses, but commanding officers object to feeding their horses on them.

On May 23rd the empty wagons with the force were sent back to Honing Kopje Station with sick.

Rietfontein (three days' supplies).—On May 28th a supply column met the force at Rietfontein with three days' supplies for men and horses for the two Cavalry Brigades and Mounted Infantry. This was issued on the morning of the 29th; during the issue the enemy opened shell fire on the wagons. No damage was done.

General Hamilton's Force.—On the 29th May, the force was joined by General Hamilton's Division; the latter were without rations for the 31st. The General Officer Commanding ordered the supply officers to hand over any supplies they had on hand, surplus to what was required to feed the Cavalry until Friday, June 2nd. Two thousand pounds of flour was all that could be spared. Rodepoort would have provided two days' supplies for the force; the bulk of this was left for General Hamilton, who was notified of the amounts obtainable.

The force has never been without rations during the present operations, and, except in the case of groceries, sufficient has been obtained from the country to supplement the reduced rates.

NOTES.

Wagons cannot overtake column.—Owing to the length and pace of Cavalry marches, unless the force halts one day in three, no reliance can be placed on supply wagons meeting the column or even its own baggage train keeping up.

Drawing supplies from country.—Under these circumstances, arrangements have to be made to draw supplies from the country; empty wagons should always accompany the Brigades for this purpose.

When no wagons are available the only method is to detach foraging parties under an officer from each regiment.

A small escort should be provided for supply officers on foraging duty, as wagons while filling up at farms often lose touch with the force.

Butchery Implements.—When troops are fed entirely on meat from the country, butchery implements should always be carried on a pack horse by each unit, as difficulty has been experienced in killing animals when wagons have not come up.

Resources of the country.—The farms during the whole march have been scattered; the only supplies that can be counted on with any certainty are cattle, sheep, oat or mannah hay, and at this time of the year whole mealies. Kaffir corn is also obtainable, but it is not safe to feed horses on it. Boer meal is sometimes found in small quantities, but generally speaking bread stuff and groceries are not obtainable except in towns.

Supply Officers.—Since leaving Kroonstad, both supply officers have accompanied their brigades; this is absolutely necessary when supplies have to be drawn from the country.

Both Lieutenant Hazelton, 4th Cavalry Brigade, and Lieutenant Evans, 1st Cavalry Brigade, have done excellent work in this respect. The latter has been particularly energetic.

D.A.A.G. (6) Cavalry Division.

Berg Vlei, June 3rd, 1900.

APPENDIX "B."

Report.

VETERINARY REPORT FOR THE MONTH ENDING 31ST MAY.

(Handed in by Lieut.-General Sir J. D. French, K.C.B., K.C.M.G. Vide page 302.)

To A. A. G. Cavalry Division, Berg Vlei.
2nd June, 1900.

During the past month the 2nd and 3rd Cavalry Brigades have been detached from the headquarters of the Cavalry Division; consequently this report deals chiefly with the 1st and 4th Brigades, although during the time the Division was at Kroonstad, the 2nd and 3rd Brigades were frequently visited and the veterinary duties supervised. When the 1st and 4th Brigades marched from Bloemfontein on the 6th and 7th May, the horing could not be considered satisfactory. Both Brigades had only very recently received a large number of remounts, which were not in a fit state to stand hard work, many suffering from Catarrhal Fever, while all were in a soft condition. On arrival at Kroonstad many of the horses were exhausted and others were suffering from sore backs, but a large number recovered during the week's rest they were given after the town surrendered.

Remounts.—At Kroonstad on the 17th May, the 4th Cavalry Brigade received 352 remounts. These animals were distributed as follows:—171 to 8th Hussars, and 181 to the 14th Hussars. They were animals of various breeds, and were in a very unsatisfactory state. A board of officers was assembled to report upon them the day after their arrival, when 112 were found unfit for immediate work. Of these, 21 were destroyed, 65 sent to the veterinary hospital for treatment, and 26 were taken along the road to be placed in the ranks when fit for work. On the 20th May, 350 remounts were received by the 1st Cavalry Brigade. These were in a better state but could not be considered good. On the 22nd May, between Welgelegen and Roodeval, 75 remounts were received by the 4th Cavalry Brigade. These were all animals which had been in different regiments and re-issued by the Remount Department. They were very exhausted on arrival. Eight were suffering from catarrhal fever, eight were lame. Eventually seven had to be destroyed, and several others were brought along to Johannesburg without doing a day's duty in the ranks. Taken as a whole the remounts were very unsatisfactory. They arrived unfit for hard work, and the majority of their feet were in a very

neglected state. Several had suffered recently from pneumonia and were consequently unfit for fast work.

Forage.—The horses of the Brigades lived to a great extent on the country, receiving oat and mannah hay in fair quantity, which partly made up for the occasional short ration of oats. They can never be said to have been starving, but considering the work they were performing they rarely received sufficient food, especially the larger English and Australian horses.

Disease and Injuries.—During the month eight horses and eight mules were destroyed for glanders. A considerable number of animals, chiefly remounts, suffered from catarrhal fever, which rendered them unfit for hard work and caused them to lose condition. The remounts' backs were injured by the saddles, and the more seasoned horses as they gradually lost condition became unfit for duty from the same cause. A number of suitable draught horses whose backs became unfit to carry saddles were handed over to the Artillery to be used in draught. There were fewer cases of laminitis than in previous months, owing to the force of travelling at a slower pace.

Farriers.—As usual on active service the casualties amongst the farriers has put a considerable strain on the remaining men, and caused considerable difficulty in keeping the animals properly shod and the sick and injured attended.

Sick Animals.—At Vet River, the 1st, 3rd and 4th Brigades sent back chargers and 180 troop horses to Bloemfontein unfit to proceed north, and at Kroonstad all horses unfit for further service were sent to the veterinary hospital which was opened there.

Casualties.—The attached return shows the casualties as far as they can be ascertained at present since the divisions left Bloemfontein. The large percentage of casualties was chiefly due to continuous marching with unfit and over-weighted animals. The horses now remaining with the 1st and 4th Brigades are, on the whole, leg weary and require rest. Those of the 1st Brigade are far fitter than those of the 4th Brigade.

(Signed) L. J. BLENKINSOP, Vet. Captain,
S.V.O. Cavalry Division.

FORTY-FOURTH DAY.

Wednesday, 11th March 1903.

PRESENT:

The Right Hon. The Earl of ELGIN AND KINCARDINE, K.G., G.C.S.I., G.C.I.E. (*Chairman*).

The Right Hon. The Viscount ESHER, K.C.B., K.C.V.O.
The Right Hon. The Lord STRATHCONA AND MOUNT-ROYAL, G.C.M.G.
The Right Hon. Sir GEORGE DASHWOOD TAUBMAN-GOLDIE, K.C.M.G.

The Hon. Sir FREDERICK MATTHEW DARLEY, G.C.M.G.
Admiral Sir JOHN OMMANNEY HOPKINS, G.C.B.
Sir JOHN EDGE.

BERNARD H. HOLLAND, Esq., *Secretary*.

Major-General Sir CHARLES E. KNOX, K.C.B., called and examined.

17549. (*Chairman*.) You have been good enough to send us some notes (*vide Appendix, page 662 post*) upon which I will ask you questions. When did you go out to South Africa?—I sailed with two battalions of my brigade on the 22nd December, 1899, landing in Cape Town on the 14th January, 1900. The two battalions were the 1st Battalion of the Buffs and the 1st Battalion of the Oxford Light Infantry; the other two battalions followed afterwards.

17550. What was your brigade?—The 1st Battalion of the Buffs, under Colonel Hickson, 18 officers, and 786 non-commissioned officers and men; the 2nd Battalion, 23 officers and 716 non-commissioned officers and men;

the 1st Battalion of the West Riding Regiment, under Lieut.-Colonel Lloyd, 23 officers and 789 non-commissioned officers and men; and the 1st Battalion of the Oxford Light Infantry, under Lieut.-Colonel the Honourable A. E. Dalzell, 20 officers and 595 non-commissioned officers and men.

17551. You landed at Cape Town?—Yes, with two battalions, the Buffs and the Oxforas, and we went straight up to Naauwpoort Junction, in the Colony. We stayed at Naauwpoort for about 10 days, and then I went off with those two battalions to a place called Thebus, where we had to repair a railway bridge which was broken. That is on the Rosmead Junction line

Major-General Sir Charles E. Knox, K.C.B.

11 Mar. 1903.

towards Stormberg; the Boers had blown up that bridge and we went there with some Engineers and repaired it. Then we returned, and from there we went straight to the Modder River, and were joined then by the other two battalions, under Lieut.-General Kelly-Kenny. The whole division was then concentrated; instead of the 12th Brigade, which belonged to the division, we were given the 18th Brigade, and the division then consisted of the 13th and 18th Brigades. The 12th Brigade, under General Clements, never joined the division until we got to Bloemfontein; they had gone with General French in the first instance.

17552. You took part in the advance on Bloemfontein under General Kelly-Kenny?—Yes.

17553. What part did you go to then?—I went from Modder River in a flank march to Klip Kraal Drift, Paardeberg, and so on to Bloemfontein.

17554. And after Bloemfontein?—After Bloemfontein the division was broken up.

17555. And afterwards?—I took command at Kroonstad afterwards; I was sent up to command at Kroonstad, and the division was broken up.

17556. You remained at Kroonstad?—I remained there from the 7th June to the 1st August, and then I was given command of a mobile column working out to the west towards the Vaal—an infantry brigade—and after that I went to a place called Heilbron. I had a mounted column always after that, and the infantry were more or less put in garrisons.

17557. It is your opinion from that experience that the strength of the forces was not sufficient for the work throughout?—We never could make our occupation effective; when we were at Bloemfontein the whole of the south of the Orange River Colony had under Lord Roberts' first proclamation given up their arms, and were perfectly contented, and were back on their farms, and it was only afterwards, when they were forced by not having any help given to them, that they rejoined De Wet, and all the other commandants.

17558. Your point being that if you had had sufficient troops then to guard the Boers from their own people, you would have kept the south part of the country quiet?—Yes, and when I was at Kroonstad the whole of the west, Bothaville and right up to the Vaal, from Hoopstad right up to the Vaal, if we had been able to keep garrisons in the various towns and to police and give protection to the inhabitants, I am sure they would never have risen again.

17559. But to police meant more mounted men?—They were always saying to me, "Why do you not send patrols to protect us?" because the commandants used to send out recruiting parties, and they forced these people to join again.

17560. But you had not enough mounted men to do that?—No, nor infantry either; they had all gone on with Lord Roberts.

17561. Do you know how many mounted men were available at that time?—In the whole force?

17562. Yes?—No, I cannot say.

17563. Of course the circumstances of the war were peculiar in that respect?—Yes, it was an enormous country, and we could not have had the men in any case, I think.

17564. And the disadvantages under which infantry were placed in competition with mounted men were greater there than probably would be the case on other occasions?—Yes, I marched about for six weeks with an infantry brigade, and I never could do anything, because the Boers used to move about around me every day, and if I went to a new place I found them in my rear, so that the infantry were no use at all.

17565. It was not that the infantry did not march well?—No, they marched uncommonly well. I do not think you could have had a better marching division than the 6th, and they did some tremendous marches.

17566. Were they seasoned troops?—Yes, mostly Reserves; they were nearly all Reserves at the time that all the marching took place up to Bloemfontein, although the battalions were very much under strength.

17567. From the beginning?—On the 12th February, the day we started on the flank march round by Enslin to the Modder, the strength was 189 officers and 6,656 men, and on the 14th of March, the day we arrived at Bloemfontein, the strength was 129 officers (we had lost 60) and 5,190 men. We had lost 1,466 men in that time.

17568. (Sir George Taubman-Goldie.) Did you get the right proportion of officers?—Yes, the officers were up to establishment, but not the regiments; 1,082 was the war establishment.

17569. (Chairman.) When you say you had lost them, what does that mean?—I have here an explanation of the decrease; there were eight officers killed in the month, and 176 non-commissioned officers and men were killed; died of wounds, three officers and five non-commissioned officers and men; wounded, 790; missing, two officers and 52 men. We suffered tremendously from sickness at Bloemfontein directly on arrival.

17570. Is that included in those figures?—Yes, I have here with me a note about the Sixth Division, written by Major Caunter, who was Deputy-Adjutant-General at the time.

17571. Were those losses made up at Bloemfontein?—No, not until the drafts came out; when the drafts came out they were made up, but I was not with the division then. All the regiments were then separated; the 18th Brigade joined the Guards' Brigade, and went up with Lord Roberts, and the 13th Brigade was all broken up into regiments, and went to different places. There was only one division, I think General Rundle's, that ever was kept intact throughout.

17572. As to the shooting, what have you to say?—I thought the men were quite up to the shooting of the Boers, but they did not shoot in the same way. They did not shoot with their heads, they did not know what they were shooting at very often, but they shot away. The Boers are all trained game shots, and they hardly ever shot without hitting something or other.

17573. Do you think they were all so?—Yes, in the first part of the war, I think certainly; afterwards they had a scratch lot, and then towards the end of course they were left with the very best trained men—all their men were perfectly trained men then, the same as our men were; the longer the war went on the better training they got, and there is no doubt that in the forces they had at the end there were very fine riflemen and scouts, and they could not have had better. Every man was a trained man in every respect.

17574. As to the mounted infantry?—They were very bad at first. They had no idea of country, and they were too cramped in all their movements from the training they had had at Aldershot. They had very cramped ideas; in fact, the general complaint was that we could never get them away from the infantry, and they were always hanging on to the ranks of the infantry instead of being miles out on the flank. They got over that very quickly, and they improved enormously.

17575. Those were the Regular mounted infantry?—Yes.

17576. Did you find any complaints from the regiments that their best men were taken for these companies of mounted infantry?—Yes, they were always objecting to send their men away, that is when they thought that the infantry regiments would be kept together; then they did not like to send their best men away, but afterwards when they found that the rôle of infantry was almost given up they were only too glad to get all their men mounted. One regiment, the Royal Sussex, mounted the whole regiment, and they were only too glad to do so. Towards the end of the war, or even in the middle of the war, the officers commanding infantry battalions were very glad if they could get the whole regiment mounted, because they saw how absurd it was for infantry to march 12 or 14 miles a day.

17577. But that was not the system; the system was to form companies out of each regiment?—Yes, that was the regular system at first, and then, of course, they objected because they said, "We want our battalions," when they thought they were to fight as men on foot. It was not so afterwards.

17578. Did you think they were not sufficiently taught to ride even for purposes of mounted infantry?—No; the idea always was that all a mounted infantryman wanted to do was to be able to sit on a pony, and if he could sit on a pony and get from place to place that was all we wanted him to do, but that was not the case, because after a very short time of that sort of riding they had no ponies to sit on, and they did not know how to take care of their horses. A great number of them did not know how to put a saddle on a horse. With that sort of man riding on a horse it did not last very long; on a long march a man riding in that sort of way very soon gives the horse a sore back, and when the

Major-
General Sir
Charles E.
Knox, K.C.B.
11 Mar. 1903.

horse had a sore back the man did not know what to do with it, so that the horses went from bad to worse.

17579. The mounted infantry man ought to know something about horsemastership?—It is the first thing; if you take a motor car and send a man out to drive it, he may drive it very well, but if anything happens the man is done, and I look on the mounted infantry in exactly the same way. The first thing to teach them is a little bit of veterinary practice—first aid to the horse—and then how to look after him and take care of him and how to feed him; they do not know anything about that, and the cavalry are much the same.

17580. But the object of the mounted infantry is distinct from the cavalry?—Yes, it was, but I do not think it will be now. I do not think we want any cavalry. I think we want men mounted with rifles, and who can shoot.

17581. The whole of the mounted forces ought to do so?—Yes. Of course, the lance now has been done away with; the lance is an absurdity. I know General French is very much opposed to this view, but the great point is as to whether the sword is any use, and I do not think a cutting sword is any use; it should be mostly a sword for pointing.

17582. But do you not think a weapon of offence for regular cavalry is necessary beyond the rifle?—I know that General French does think so, but I would sooner charge firing a repeating pistol than go at the enemy with a sword; in a charge with the sword all the men cut; they cannot be made to thrust; they will always cut, and they always used to cut with the lance if they had the chance. When one gets to close quarters like that I do not think much harm is done with the sword; you may get a cut at one man. If we could fire like the Boers did when they charged—they charged firing their rifles—we could do far more damage than by waiting until one gets close with the sword, and it is doubtful whether one ever does get home.

17583. Will it not be different in a war where they are opposed by cavalry?—It may, but to have cavalry of that sort they must be kept fresh in reserve for a charge, whereas it is doubtful whether we would ever have sufficient cavalry to be able to keep them fresh—to be able to do all the patrolling work, and then to have a sufficient force of fresh cavalry ready. The European armies will have masses of cavalry who have never done anything at all, and who will be kept until there is an opportunity.

17584. But there are distinct functions for cavalry?—Yes, if we could have cavalry in that way it would be different, but the great object is to have as many men as we can mounted on horses who can shoot well, masses of men mounted so as to get about quickly.

17585. With a view of mobility?—Yes, I think that will be the great feature of armies in the future—the means of getting about. That is the way the Boers gave us so much trouble.

17586. Did you have anything to do with the Yeomanry?—Yes, when I first got a mounted division I had a great number of Yeomen, Australians, New Zealanders, and the whole of the Colonial Division.

17587. With regard to the Yeomen from this country, was it the first or second contingent?—I had the first, too; I had very good Welsh Yeomanry, excellent men, under Colonel Forbes.

17588. And the second contingent?—Were very bad; they could not be anything else. I do not know where they were got, but they had no idea of riding, shooting, or anything else. We got a free hand to send away all that could not be trained, and then we trained the rest, and at the end they were good.

17589. We have had a good deal of evidence about the second contingent, and it was said that those that stayed out were good men?—Yes, they were trained; they had a year's training, and any man can be trained in a year, I think, in a country like that. Of course, they were weeded out; we had a free hand to send any one away we liked—officers and men.

17590. And as to the Colonials?—The Colonials varied very much, some of them were very good and some indifferent. The ones I had with me were fairly good; I had Thorneycroft's Mounted Infantry, and they were right through the campaign from the very start—very good, excellent men. Then the Australians were very good—first rate. The reason why these men were better than others was that they had lived in South Africa or Australia, and they had an idea of

country—an expanse of country. They were not like the other men who were sent out from home, whom I always used to complain about, and said that they missed the streets; that is just it, and they had no idea of country—the enormous expanse. They could not see to begin with.

17591. Did you have Canadians?—Yes, I had for a very short time, only a fortnight, just before they were disbanded, Strathcona's Horse, and they were very fine men—excellent.

17592. And of all those branches of Yeomanry and Colonial corps what was the quality of the horsemastership?—The Colonials were very good; they understood how to look after their horses on the veldt, and they had been accustomed to it more or less. They are very hard men on horses, however, and they did not take much care of them, they rode them terribly hard, and so on, but still they could look after them; they understood how a horse ought to be fed out there.

17593. Are you speaking of the African Colonials?—Yes.

17594. And the oversea Colonials?—I do not think they were quite so good; I do not fancy that in Australia and New Zealand they are accustomed to go long distances on their horses as they are in South Africa; I do not know exactly about that, but in South Africa no man ever walks, and they ride enormously long distances, and have to look after their horses, off saddling and grazing and feeding, and all that sort of thing. All that the South African Colonial knows, being taught it from his very youth up.

17595. He knows he must spare his horse?—He must, and they could get more out of a horse. They know the proper pace to go for a journey, and so on. Our men learnt that in the end, too.

17596. In any training of future corps, whether regulars or contingents, horsemastership must be an important matter?—The first thing. Sir Evelyn Wood called on me for a report in view of the mounted infantry programme now coming out, and I put that first—teach the man first—or at any rate at the same time as you teach him to ride—about his horse, and I am sure it is necessary.

17597. Do you think it could be done?—It must be done. And then the officers too; it is wonderful how few officers in the infantry know anything about a horse—the most trifling things they do not know—how to treat it; simple little things.

17598. Which could be easily taught them?—Yes, it ought to form part of the training.

17599. (*Viscount Esher.*) Do you think cavalry officers have much veterinary knowledge?—No, I do not; there are some that have, some also are fine riders, but taking the majority of cavalry officers they are not good at all. The artillery are the best all round, they have a very fine system, and they never vary; it does not matter whether they are in barracks or on the field, it is exactly the same.

17600. (*Chairman.*) To what do you attribute that?—The regular system they have got which never varies. I have seen after a march of 30 miles all their officers at stables, just as if they were in barracks at home. You would not see that in the cavalry, and certainly not in the mounted infantry.

17601. (*Viscount Esher.*) Do you know whether the veterinary course is compulsory for officers in the cavalry?—No, it is voluntary, so far that only two officers from each cavalry regiment at home are obliged to attend each year; there used to be a six weeks' course at Aldershot to which an officer could go if he wished.

17602. (*Sir Frederick Darley.*) Do they understand shoeing?—No, I spoke only the day before yesterday to a mounted infantry officer about that, and I said that they ought to learn shoeing too, but he said it was impossible to teach them shoeing, and that if you had two or three good farriers it would be sufficient, but the time could not be given to teach the men, and probably they would never be taught to shoe a horse.

17603. (*Chairman.*) To teach the men?—Yes.

17604. (*Sir Frederick Darley.*) But the officers?—I do not think they ever go through a course of shoeing; they have so much to learn that it is better to strike out things that are really not absolutely necessary, and I do not know that it would do them much good if they could shoe. I think they ought to know whether a shoe is properly put on or not.

Major-General Sir Charles E. Knox, K.C.B.

11 Mar. 1903.

17605. That is what I meant?—They ought to know something about the system of shoeing horses, and whether a horse would do better in one class of shoe than another. I do know something about horses; I have all my life been with horses, and I found it an advantage out there. I had a very fine English horse who was always going lame, and last of all I told the man to shoe him with what they call seated shoes, so as not to press on the sole, and he never went lame again. A farrier would not have done that; I just thought I would try it, and it succeeded, and that horse carried me the whole time. I think that they ought to know those little things about a horse's feet.

17606. They ought to know whether a horse is properly shod or not?—Yes, that ought to be included in a sort of course of lectures on veterinary practice, and I think officers and men ought to go through that during their course of mounted infantry. Of course, they can strike out a great many things; for instance, they are supposed to learn how to shoot in their battalion, and to teach them how to signal, and that sort of thing is not necessary.

17607. (Chairman.) In the training of cavalry you think the difficulty is getting sufficient ground?—Yes.

17608. Do you mean a sufficient expanse?—Yes, the only place I know that we have got is down at Salisbury on the Plain, and that is not very big. It is possible to go from one end to the other in a patrol.

17609. What is the remedy you see for that state of matters?—I do not know whether this new ground in Scotland would be any better. I think the only training ground for cavalry is in India and in South Africa.

17610. (Viscount Esher.) Is it specially scouting you have in view?—I think all cavalry ought to be taught to scout. I do not mean by scouting skirmishing, but the art of scouting; that is not taught, and I do not think any one in our Army could teach it except Baden-Powell, who has written a little book about it; but I do not think he knows anything about it.

17611. That is what you have in your mind; when you say you want a great extent of ground, is that what you want?—Yes, for scouting and patrolling, and teaching them how to observe, and write reports, and that sort of thing. It might be done at Salisbury Plain, but I am certain it cannot be done at Aldershot. I think they never seem to have any idea how far cavalry can go, and what a horse can do in a day if he is looked after. The Boers thought nothing of going 60 miles in a night, but if one of our cavalry officers was asked to march that distance he would be astonished.

17612. That is the experience you ought to give them?—Yes, that is what we ought to teach them, and to do that the horse and the saddle must be lightened, and everything made as light as possible.

17613. I was thinking of your point of there not being sufficient training ground; it seems to me that it is for scouting more than anything else that you want it?—Not for drill.

17614. Or for horsemastership?—No; drill is nothing, and it is merely to teach them to have an idea of country.

17615. (Lord Stratheona and Mount-Royal.) Would you have a distinctive body of scouts apart from the ordinary cavalry—of mounted infantry?—No.

17616. (Chairman.) You say that you know the Boers looked on the artillery and infantry as magnificent?—Yes, they were always saying that about our artillery and infantry. They did not think anything of the cavalry, but I do not think they distinguished between the cavalry and mounted infantry; I do not think they knew which was which.

17617. As regards the artillery, you agree?—Yes, I do not think the artillery can be improved; their guns can be improved from time to time; that is a matter of experience, but I am certain their methods and system and so forth cannot be improved. There are little things like the harness being made lighter, and they want more horses; all the artillery officers told me that they want more spare horses, and so on.

17618. But otherwise you would leave them as they are?—I would, indeed.

17619. With regard to the infantry, it is a question of greater initiative, is it not?—Yes, and that is a big question. I do not think the class we recruit from are very intelligent men, as a rule, and it is very difficult to teach them anything. One in ten may be got whom it

would be worth while to teach scouting, tracking, and all that sort of thing, but I do not think we would be able to teach them more self-reliance and individuality, because the infantry work in denser formation, and they are always together, at all events a section would be the smallest number of men we would have working. Two men would not be sent away patrolling as mounted men are sent.

17620. They are very much split up now in an advance, are they not?—They are extended to a greater degree, there are 10 or 20 paces between the men, but that is not much, and they are always together, more or less, under their officers, and they always look to their officers and non-commissioned officers for every thing. Where more individuality and self-reliance are necessary is when a man finds himself out on out-post and has to act on his own initiative; that could be taught more, I think.

17621. You think they have sufficient intelligence for that?—I think so fairly; some of them are awful fools, and they could not be taught anything.

17622. But even advancing in extended order, a man must look out for a stone or whatever there is as cover for himself, must he not?—Yes, we can teach them that all right, and it is easy enough when there are plenty of bullets flying about; they do not want teaching about taking cover then, and the thing is to teach them not to take too much. I think that is born into the man. The Boers always said, "Your men do not seem to care about their lives a bit"; but when men are advancing like that they must go on. The way the Boers did was that individual men acted alone, and they were always running about from rock to rock and hiding, but we could not do that in an advance of infantry.

17623. Can an officer be trained to have more initiative?—Yes, some are very good, and others are not so bright; you cannot expect them all to be the same. You see our system is rather against it; with a regiment in barracks an officer has to go and see whether the men's dinner is all right, and he has to see every single thing like that takes place, so that the men always look to the officer for every single thing, just like children; they cannot do anything unless an officer is there to see that it is all right. We are getting better now in that way by giving them a more free hand; they can go away all right now, and be back again in the morning, and that shows the men they are trusted more.

17624. Do you approve of that system?—Yes, I think it will do a lot of good; some commanding officers do not like it, but the only reason they do not is that when there are a lot of men in barracks it is rather a nuisance to the other men if men come in all night long, and that is why they do not like it. The men who were in bed at 10 o'clock and did not want to go out have no rest at all, because the others are coming in all night long, some of them drunk, and it is not very pleasant. That is the drawback of that system.

17625. As to staff officers?—I think they are too much in the offices; there is such a lot of office work to be done, and they are too much confined to them.

17626. Do you not approve of Staff College officers on the staff?—I approve of the education they get at the Staff College, but I think that then they ought to go away and have more practical work afterwards.

17627. Do you mean with their regiment?—At the different big manœuvring stations, like Aldershot and Salisbury, and send them abroad, too, and anywhere, so as to get them field work before they take up any appointment. They do join at Aldershot and are attached to a cavalry or infantry regiment to do office work and that sort of thing, but I do not think it goes on long enough.

17628. But I suppose you would like officers who serve on the staff to go back to regimental work?—Yes, they must go back.

17629. And it is an advantage that they should?—I have never been on the staff, and I believe in the regimental officer and the ones who stick to their regiment.

17630. Were you satisfied with your staff during the war?—Yes; but, of course, I had lots of changes.

17631. Had you both Staff College men and non-Staff College men?—I had one, Colonel Kincaid, R.E., who I do not think was ever at the Staff College, and the other one I had, a Brigade Major, was a Staff College man.

Major-
General Sir
Charles E.
Knorr, K.C.B.

11 Mar. 1903.

17632. But you recognise that the Staff College is an advantage to a man on the staff?—The education is, of course, an advantage.

17633. As to supplies, I do not think I need ask you except about the horses. You say the quality of the horses was good?—I do not know what the number of horses in the country was. That paragraph of my *précis* (*vide Appendix. page 663 post*), beginning "The Remount Depot," should be the Remount Department, and not any particular dépôt. They were all right at the end, but they took a long time to learn what was wanted.

17634. You say a little before that the quality was good, but the horses were never given the chance to recover?—Never; they were landed, and probably in a week or a fortnight they were out at work, whereas in South Africa they want to get acclimatised. The system which we had at the end of the war, when they were put into a large dépôt, where they were worked four hours a day, being driven round a ring two hours in the morning and two hours in the afternoon to get them fit, was the right system, and they were fit then to go to work. We were never allowed to work them to a finish; directly a horse got bad, overworked, at the first station we touched these horses were sent back, and fresh ones were issued. That was the proper system, and we were all right; a horse then went back, and was resuscitated, and was probably fit for work again in a month; but in the beginning we could never get any fresh horses, the horses were ridden to the end as long as they would carry a man, and directly they fell they were left to die on the veldt.

17635. The Army Service Corps you found not sufficient?—I never had any privates of the Army Service Corps; I only had officers. They were always employed in the different garrisons.

17636. But that corps requires strengthening?—Yes. I would make use of them as conductors, and that is their department. We employed Colonials altogether under the Army Service Corps officers.

17637. You mean natives of South Africa?—Yes.

17638. And natives too?—Yes. Of course all the drivers were natives. We were obliged to have native drivers, and I do not think our men would have been able to drive a team of sixteen mules.

17639. But for the proper organisation there ought to be some means of expansion of the corps?—I think so; I think if we had men trained as conductors and drivers of all sorts, mules, oxen, and so on, then they could be overseers in case of war, whatever country we had to operate in, and we could have camel men and all that sort of thing. Of course, in India they understand that kind of thing.

17640. The same remark as to expansion applies both to the medical and engineer services?—Yes, certainly to the medical service. We had to get a larger number of civilian medical officers, and of course that shows that wants easy expansion. We ought to know who to get and where to get them.

17641. But the work done was good?—I think so. Of course at Bloemfontein we were terribly rushed at the beginning, as there were no tents, and the men were dying like flies; there was a tremendous rush then, but it was not the fault of the Medical Department.

17642. That was until the railway opened?—Yes, that was just the fortune of war. If we had had good hospitals at that time it would have made a difference.

17643. You think the 12-pounder was a useless gun?—Very; that is the Horse Artillery gun—perfectly useless.

17644. What would be your recommendation with regard to the guns?—I think the guns that they have now at Aldershot, the quick-firing guns, are the ones, and we must have quick-firing guns. We have still the 15-pounder, but the breech has been altered; it is a very nice gun, but not a quick-firing gun. At Aldershot I think they have two batteries of German quick-

firing guns. General Marshall tells me they are beautiful guns, and there is a slight modification of the same gun for horse artillery. We must have quick-firers. I suppose from time to time there would be improvements in guns; the worst of it is that I do not think we sometimes take the trouble to find out what the improvements are, otherwise we would never have gone out to South Africa with the guns we had. I think that is a matter for artillery officers to keep themselves up to date in.

17645. And the rifle?—The rifle is a very good rifle. I have not seen the new rifle, the modification with the shorter barrel, and so on, but a better rifle than the Lee-Metford is not wanted, only having a clip loading instead of the magazine; only five cartridges can be put in together by means of a clip, and I believe that has been done, but I have not seen the rifle. It is a better rifle than the Mauser, I think—a better made rifle.

17646. You spoke of lightening the weight on the horses, but you wish also to lighten the equipment of the infantry?—Yes, that is rather a difficult matter; according to the regulation a man has to carry 100 rounds, but we always carried 150 going into action; that is a good lot to carry, and the man ought to be able to carry some food in case he cannot get his ration for the day, and it is a difficult thing to know how he is to carry all the things he wants.

17647. We have heard also that the great coat is a difficulty?—We carried a blanket instead of the great coat. Something ought to be carried, whether a blanket or a great coat does not much matter, but a man ought to be able to carry the one or the other. Then they ought to have bandoliers, not pouches; two bandoliers to carry 150 rounds, and a great coat and haversack would load the man pretty well. I have seen them equipped like that, and it is marvellous that they can march at all.

17648. What is your recommendation?—They must have the ammunition, and I think it all goes back to the old thing that they must have a company cart to carry the entrenching tools, and something of that sort.

17649. To be close up?—Yes, to follow always with the company, or say a double company. I think that is the only way out of it, and in fact that is what did happen; their kits were always carried for them. We gave up carrying the blankets in the end too; the carts always carried them.

17650. And that is practicable?—We could do it out there, because we had mules, and I do not see why it should not be done. I believe it will come to having motors or some mechanical means of draft. It was absurd to ask the men to carry the valise, but they do want to carry a certain amount. I have seen different things tried, and I know it always came to this, that when I was going with a mounted column I generally had 100 infantry whom we carried on the carts. We did not ask them to walk, and their kits were carried for them also; even then they could not carry their own kits, they must carry 100 or 150 rounds of ammunition, and some way must be found of carrying their blankets and their kit.

17651. (*Lord Stratheona and Mount Royal.*) How do you propose to do that?—In company carts, I think or squadron carts, because you must carry entrenching tools. The men used to carry a Wallace spade, but they threw them away as they were no use; they threw them away on board ship, and when we landed at Cape Town there were few Wallace spades.

17652. (*Chairman.*) They cannot have tried them on board ship?—No, but they knew what they were to carry, and they did not intend to carry them. We had one man in a section who had to carry a spade, and he did not intend to carry that, so they threw them out of the port-holes.

17653. (*Lord Stratheona and Mount Royal.*) What is the present weight carried by an infantry soldier?—I could not quite tell you.*

* The witness subsequently sent in the following information:—

Equipment Carried by the Soldier.		lbs. ozs.	lbs. ozs.
Rifle and bayonet - - - -	10 10	Great coat - - - -	6 2
100 rounds ammunition - - - -	6 0	Belt, straps, etc., say - - - -	3 0
2 bandoliers - - - -	2 10		
Water bottle - - - -	1 1	Total - - - -	33 11
Mess tin - - - -	1 8		
Haversack with 1lb. bread and 1lb. meat	2 12		

If one blanket is carried in place of the great coat, the usual before going into action, add 3lbs.

total will be 32lbs. 1oz. If 150 rounds are carried, as is

Major-General Sir Charles E. Knox, K.C.B.

11 Mar. 1903.

17654. (*Sir Frederick Darley.*) You would only ask him to carry his ammunition, I suppose, and one day's provisions and water?—His water bottle, his ammunition, and a haversack containing whatever he liked to put in, bread and cheese, or whatever he could get.

17655. For one day?—Yes, that is all. I would carry his blankets or his greatcoat, or whatever it was, in carts.

17656. (*Chairman.*) You say that deer stalking would be the best thing for them?—Yes. Sir Evelyn Wood has got a plan—of course, I do not believe in it because I am not a bad shot with the gun, a good ordinary average shot—but he is going to try to teach them to shoot clay pigeons with a rifle. I said "I cannot hit them with a scatter gun, and I do not think that Tommy Atkins will have much chance with a rifle. We have, however, got the rifles, and we have little cartridges with shot in them, but they will never hit them. The idea is to make the men shoot quickly, and that is one system. Of course, the other system is crafty shooting—stalking as the Boers did; they stalked our men as they would stalk a springbok, and when they saw the springbok looking up in alarm, they would lie still or get round some other way, whereas our men would go straight for it, and never get a shot at it at all.

17657. Are they training the men on Salisbury Plain in that way?—There are no men on Salisbury Plain yet; they only come there on the 1st May; when they pitch the encampments on the 1st May there will be a tremendous lot of men training. We have nine batteries of artillery now, and they have a splendid artillery range.

17658. And finally you say the most important corps is the Intelligence Corps?—That is where we suffered most of all.

17659. What do you exactly mean by an Intelligence Corps?—What we had at the end; every column had an Intelligence officer attached to it, and his business was to collect guides, to collect all the information he could from the people about—anyone—any sort of intelligence that was any use, and he wrote up the diary of the day, and all that sort of work. In the beginning of the war we never had any guides; we never knew exactly where we were.

17660. Was he a member of the General Staff?—Yes, and he had guides under him.

17661. What was he called?—The Intelligence officer; that was his title.

17662. What rank did he take on the staff?—Deputy Assistant Adjutant General. We cannot do without them. Of course, operating in France a man ought to speak French thoroughly; in South Africa we generally had men who could speak Dutch.

17663. Is not that provided for under the ordinary system that each General should have some member of his staff for that purpose?—He tells one off, but I want a trained man who knows exactly what to do when he starts. The General could tell off a man, but I know one division which, when they had arrived within four miles of Bloemfontein, did not know where Bloemfontein was. It was at night certainly, but the Intelligence officer ought to have known exactly where he was, and where Bloemfontein was, and they were only four miles off and did not know. We often got like that—that we did not know where we were.

17664. You were deficient in maps in South Africa?—Yes, very deficient—not in the end, because then we had some very good maps, and of course as time went on we did not want maps. I knew the Orange River Colony as well as I knew London, and perhaps better, and I did not want maps.

17665. (*Viscount Esher.*) Before you had that special Intelligence officer attached to you what did you do?—We went according to what the conductors of the wagons used to tell us, and by the map. The Intelligence officer was a very important man—he was the man.

17666. And the whole time you commanded a column did you have an Intelligence officer with you?—Yes.

17667. Always an officer of the General Staff?—Always an officer. The last man I had was a civilian; he was an excellent man, too. He held the same position, but did not belong to the Army; he was an Australian.

17668. Did you always have a trained Intelligence officer with you?—Yes, always when I was commanding a mobile column: I would not go without one.

17669. I gather from your *précis* that you think that one of the principal lessons of the war, if not the principal lesson of the war, is the necessity for mounted infantry?—Undoubtedly.

17670. When you say that you think a large force of mounted infantry should be trained, but not kept up as a mounted establishment, does that mean that you approve of the system that they have adopted at Aldershot of gradually passing infantry soldiers through the mounted infantry course?—Yes. The establishment of horses necessary could not be kept up, but that has been improved upon now; by the last order they are to pass an entire company of a battalion through in the year.

17671. Do you think it would be advisable, having passed one company of the battalion through the mounted infantry this year, to pass another company through next year?—Yes, it would go on every year.

17672. And do you not think, on the whole, that is preferable to having a special mounted infantry establishment?—I do, because we gradually train all our men, and it does not matter whether they go to the Reserve or not, they are still able to come up and be mounted men, and if we could train the whole nation that would be a good thing.

17673. What is Sir Evelyn Wood doing with the Second Army Corps in the way of training mounted infantry?—No training commences until the 1st May, because we have not got the barracks; all the men will have to be under canvas, and the horses picketed, so that nothing will be done until 1st May. On the 1st May 400 mounted infantry come up for training under the new system; each battalion sends from each of its companies one section.

17674. And they are forwarded in companies?—Yes, and when they are trained, four more sections come, and so it will go on until the whole battalion has been trained. They are increasing the numbers, and the qualifications will not be so high; they will not ask the men to be first-class shots, and that sort of thing, but they must have good eyesight.

17675. Is the commander of the Second Army Corps tied down by regulation in the training of mounted infantry men, or may he vary, for instance, the system adopted at Aldershot?—We have not got the new regulations yet; yesterday at Salisbury I got a notification that the new regulations were coming out for trial, but they have not come, and I do not know exactly what the system is to be.

17676. When the new regulations are out will Sir Evelyn Wood be bound by them, or will he have discretion to vary them if he pleases?—No, I think there will be a uniform system throughout the whole Army.

17677. I suppose you do not by chance know whether any system has been adopted in India for training mounted infantry?—No, but I know they are training the native troops.

17678. The native infantry; you do not know that?—Yes, because they are employing some of the native mounted infantry in Somaliland.

17679. (*Sir Frederick Darley.*) What was the name of the officer who commanded the Australian corps under you?—Colonel Knight.

17680. He was a Regular officer, was he not?—Yes, he is either at the Staff College now, or he has gone back to his regiment; he belongs to the Loyal North Lancashire Regiment.

17681. It so happened that the contingent he commanded were all Bushmen?—Yes, the first lot were bushmen, and an excellent lot.

17682. As to those men, you have no fault to find with the distance they could ride in a day?—No, they were first class men. We could not have better men than that, but they were men who had learned it from their youth up. Although they were called Bushmen they were not all Bushmen, but there was a sufficient sprinkling amongst them.

17683. They were all from the country?—Yes. We have lots of men in London who have never seen anything but London; and the same thing applies to all big towns, Liverpool, Manchester, and Sheffield. What do they know about the country?

17684. They were good horsemasters as far as knowing how to treat horses was concerned, although they might ride the horses very hard?—Yes, they brought their own horses with them, and splendid horses they

Major-General Sir Charles E. Knox, K.C.B.

11 Mar. 1903.

were, too; it was their business to look after them. They were good horsemasters.

17685. Had they spare horses with them?—No, I do not think so.

17686. Did they get spare horses?—At one time they did, because they were under Colonel De Lisle just before I got them, and Colonel De Lisle said that if Lord Roberts would mount him properly he would guarantee that he would catch De Wet, and they had three horses each, but they never did catch him.

17687. They used to drive their horses before them when they were on the march?—No, the spare horses were generally ridden and led by the black boys in the same way as the Boers did.

17688. Were the spare horses ridden?—A black boy would lead one and ride another; the black boys could ride and lead three or four horses.

17689. On the march did they change horses sometimes?—Yes, they were always given a free hand, and could do exactly as they liked about that. If one horse was tired the man had not to go and ask an officer if he could get on another.

17690. In that way you could cover a great deal of ground in a day?—We could march 60 miles in a day; we always did 30, and it is not a very great push to do another 30. I suppose, as a matter of fact, the flanks generally did about 40 miles, because they covered a great deal more ground than the column.

17691. Are the regiments in your division now at Salisbury up to their full strength?—There is no division yet; when the barracks are built, in about four years' time, there will be a division there, but at present that division is quartered, some at Plymouth and some at Pembroke Dock, and all over the place. I could go and see my regiments if I liked any day, but they are all under other generals.

17692. Do you happen to know whether any of the regiments are up to their full strength?—I am certain they are not up to war strength; they would probably be on the home establishment.

17693. What is the home establishment of an infantry regiment?—700.

17694. Are they up to that, do you think?—No, I should not think they were but I cannot tell you for certain. I know they are getting recruits very fast now, owing to bad trade and want of work, and so on.

17695. Can you tell me what number of men are told off in a regiment for duties outside regimental duties?—I thought about that point, because I wanted to suggest something. I should think at least a hundred men a day are employed, including officers' servants, cooks, men who have got to stay in the barracks—what they call barrack room orderlies, school orderlies, and general orderlies.

17696. In cleaning up barracks?—Cleaning up and doing different work; the place must be cleaned up.

17697. So that if a regiment is up to 600 or 700 men there are 100 of these not on military duty?—You may take it that at least 100 are employed as officers' servants or in the officers' mess, the sergeants' mess, and all the different things they have to do. They always keep two men in every barrack room, who are called barrack room orderlies.

17698. Does not that interfere very much with the military training of men?—It does, but when a company is struck off for training no men are taken out of that company for these things, and the other companies find them. When a company is taken off for its month's training none of the men are taken out of that company, and all the men in the company go back to duty.

17699. But it is only the officers in that company who are being trained with their men?—It cannot be done all through; that is why I think every regiment ought to have men who are not doing any duty at all for these jobs; either reservists, or let a man, after he has done his three years, join what I would call the regimental reserve for fatigues, officers' servants, cooks, and so on; he would serve on and do nothing in the year except a course of musketry.

17700. The objection to that is that it would cost a great deal of money?—But I would not give them any extra pay.

17701. Do you think the money could be better spent?—Yes, I would let them go on at their regimental pay. We should then be employing men we

knew instead of having other men brought in, but all officers ought to have reservists as servants.

17702. When there is a short system of service, three years, the whole time ought to be taken up in the training of the men?—Yes, of course, it is little enough, but these things must be done; the men must have their dinners cooked, the officers must have servants, and the barracks must be cleaned.

17703. But it ought not to be done by the men in the actual course of learning their profession?—No, of course not. It is the same with the officers; they have so much to do that although some people look on the regimental officer as an idle man, all day long he has work to do, and not only that, but he is now responsible, or has always been so, for paying his men, and very often they suffer great pecuniary loss from that. They are given a colour-sergeant whose whole time is taken up keeping accounts and paying the men, and that sort of thing ought to be done as in the Navy, by a paymaster, and the officers ought not to have anything to do with paying the men.

17704. Is the company officer's time taken up with other kinds of work rather than company work?—Yes, he has not to look after the canteen as he had before, but he has a great deal to do, and as to the colour-sergeant, who is the man next to an officer in the company, all his time is taken up keeping accounts.

17705. And his special business ought to be training the men?—If anything happened to one of the subalterns he is the next man. Last night I was talking to Colonel Bowles, who commands the Yorkshire Regiment, and he complains bitterly of the need for more non-commissioned officers. He says that in a company a non-commissioned officer is taken away as caterer, another for the gymnasium, and another for the school, and there are not sufficient non-commissioned officers in a company. He wants more non-commissioned officers. A large number of them go away to classes; some go to Hythe to the School of Musketry; some go to Aldershot to learn the gymnastic work, signalling, and all that sort of thing, which takes an enormous number of non-commissioned officers from the regiment.

17706. Your opinion is that with a three years' service the whole time of the non-commissioned officers and men ought to be devoted entirely to learning their military duties?—Yes.

17707. And that the work which now devolves on these men, although it costs money, ought to be done by men who are not going through the three years' course?—Undoubtedly.

17708. (Sir John Hopkins.) Under the head of the Remount Department, it is stated in your précis: "And this, taken in conjunction with the indifferent horsemanship of mounted infantry and Colonials"—by Colonials there you do not mean any but the South African Colonials?—No. As to the others I have no experience, except of the first bushmen, and they were first rate. I believe the second lot were not at all of the same class as the first, but I know that a large number of the Colonials, Kitchener's Scouts, and a lot that were raised at the end of the war, merely loafers from Cape Town, were quite as bad horsemen as the Yeomanry were.

17709. If this is read as Colonials, it will mean the New Zealanders, the Australians, the Canadians, and so on?—I did not mean that. I might say, "A portion of the Colonials."

17710. (Sir George Taubman-Goldie.) You say you think the Reservists who went out in the beginning of the campaign were far superior to the drafts of young soldiers who arrived from England later on?—Yes. In every way; I only saw those drafts later in the block-houses, and so on. At the time my division was broken up we had the old Reservists still with us, and the drafts had not come up.

17711. During the later portion of the advance on Bloemfontein, say in the 4th, 5th, and 6th months of the war, you must have had a number of men sent out as reliefs or new troops?—No, the only drafts for the division arrived at Bloemfontein after we had got there. We had a draft of 120 men for the Oxfords, who joined us at Bloemfontein, and they could not join us before, as they had not arrived in the country. When the railway was opened they came up from Cape Town.

17712. Practically as regards the earlier movements of the war up to Bloemfontein you were working, as far

as the Regulars and Reservists were concerned, with men who had been trained for war?—Quite so; no drafts arrived until we got to Bloemfontein for my brigade.

17713. Our difficulty in South Africa was that we had of course in extending our forces largely to work with a large number of men who were not trained for war?—Quite so; I do not suppose that even when they went out the larger portion of these men had ever been on active service before.

17714. By being trained for war I mean that they had been trained for the purposes of war, but had not been to war?—Yes.

17715. We had, of course, ultimately nearly 400,000 men sent out as against 80,000 men we were prepared to send out; did you notice in your subsequent operations much disadvantage from having practically untrained men?—Certainly; the Yeomanry were a very good example—absolutely untrained for anything.

17716. Leaving the Yeomanry and coming to the Militia?—When I gave up the infantry brigade, which I mentioned I was operating with in the western part of the Orange River Colony, which consisted of one Militia regiment and one Regular regiment, I ceased to have anything more to do with infantry.

17717. So that I cannot ask you about infantry at that time?—No; I had 100 men of the Grenadier Guards whom we put on carts, and who went about with us, and I had no infantry afterwards.

17718. From your general experience as a soldier, would you say that an infantryman can be trained fairly in about six months?—Certainly not.

17719. How long do you think it would take to make a man an infantry soldier?—One year from the time he joins.

17720. You are taking the average recruit?—Yes, I would train him in a year, mounted infantry, and all.

17721. The average recruit?—Yes.

17722. Supposing you got men from an intelligent class you would do it in less?—Yes; as to the first three months at the depot, it takes them all that time before they have been through a course of gymnastics and been made all right; then they have done no shooting, and they would take another three months to learn shooting, that is six months; in the other six months they would be repeating that, and at the end of the year they would be turned out all right.

17723. Taking the nation as a whole, I take it that the less educated classes will require a year, and the more educated classes six months?—Yes; if an officer of that class was to enlist I think he could be taught in three or four months to do all that is required; it all depends upon the intelligence.

17724. That brings in my point, which is this, that supposing the nation were to submit to universal military education at the age of 18 for a year—three months, six months, nine months, or a year—as they did submit to universal Board Schools—I think with much of the volunteer class they could be taught in six months.

17725. But supposing the nation submitted to that system, you would have enormous reserves for volunteers to come from in case you wanted great expansion for a great war?—Yes, I think it would be quite easy to teach them, because I do not believe we need to teach any drill; a man can be taught sufficient to move about in a fortnight, and all that is necessary to teach him is to shoot and ride.

17726. What about marching?—Marching is a matter of training; for instance, I could not march ten miles now, but I think in a month I could do so.

17727. But that training is important?—Undoubtedly. I do not see why a man should have a vote in the Government of his country without also being able to bring up a rifle and defend it. Before giving a man a vote I should rule that up to 30 he should be able to prove that he can ride and shoot. Why ought he to vote for the Government if he cannot defend his country?

17728. Might you not go further, and say that as every boy is obliged to learn the three R's he should also learn how to shoot?—Yes. Of course there would be great opposition to that.

17729. (Lord Strathcona and Mount Royal.) The question put by Sir John Hopkins as to the outside Colonies is of some little importance, as in the Colonies

they might be somewhat sensitive, as to an opinion with regard to their intelligence; were you perfectly satisfied with all that you saw of the troops from the Colonies, both Australia and Canada?—Yes.

17730. Did you look upon them as intelligent and good soldiers, and especially good mounted infantry?—Certainly, the first lot of Bushmen from Australia and New Zealand; there were two batches, and with regard to the second lot I cannot say anything. I never had any with me after the first lot.

17731. But so far as came within your own observation?—They were very hard men to deal with; great drunkards, and that sort of thing; they had not much idea of discipline, but they knew what you wanted to do, and they would do it, but they would do it their own way.

17732. And they had intelligence too?—Yes, but they were a handful rather to take care of; if we got into towns, for instance, they would play mischief, but they were just what you would imagine Bushmen from Australia and New Zealand would be. They had no idea of discipline.

17733. Still, they were a very useful set of men?—Excellent, and Strathcona's Horse was a very fine regiment.

17734. Altogether both from Australia and Canada those you had were very good men?—The only men I referred to here were some wasters, who had been picked up in Cape Town and Durban, people off ships, and all sorts of riff-raff.

17735. Have you given much attention to the question of having special bodies of scouts attached to brigades or divisions?—No. Do you refer to infantry brigades or divisions?

17736. Yes?—I think every infantry battalion should have a certain number of mounted men always ready, but so they would have.

17737. And you would have them trained for that purpose?—No other training would be required, but what every mounted man should have—good intelligent men.

17738. Would you not select for that purpose those of special intelligence, these who are alert, active, and of keen vision?—Yes, but that is what I would make all mounted men.

17739. Then you would not have special corps for scouting?—No; out in South Africa there were special corps called Kitchener's Scouts, and So-and-so's Scouts, but they were just the same as the others, and it was only a difference in name; every mounted man if worth anything must have all those qualifications; he must have good eye-sight, he must be able to observe everything keenly, or what is the good of mounting him?

17740. But you can hardly have in the same body of infantry or mounted men only those who are equally intelligent?—I quite agree you cannot have that. I see your point, that you want picked men.

17741. Yes, and that this should be done not in the field only but in the time of peace; that you should train such bodies; you are aware such is the case in the United States?—Yes.

17742. And they are found most useful there?—If we had corps of that description I would have them all composed of trained scouts like the American scout, Burnham.

17743. Take, for instance, Lovat's Scouts, they were very good scouts, I believe?—But they must all hold certificates of training, because otherwise a man calling himself a scout might be no use at all.

17744. You would be able to choose, at any rate, for that purpose?—Yes, but there, again, those corps would be more useful with cavalry who are going quick than with infantry going slow; it is not necessary to employ an expert of that class with a slow moving body.

17745. But having them you would be able to utilise them as might be required?—Yes, but I would attach that sort of man to the Intelligence Department, that is where they will be wanted, and not in the corps. I should make that part of the Intelligence Department, so that if I was commanding a division I would say "I want so many trackers and so many So-and-so," and they would send me the men.

17746. But you would be in favour of specially trained men?—I think we must try to train all our men as much as we can to scouting, but we cannot do that unless we first get a body of trained scouts who can pass an ex-

Major-General Sir Charles E. Knox, K.C.B.

11 Mar. 1903.

Major-
General Sir
Charles E.
Knox, K.C.B.
11 Mar. 1903.

amination in scouting and tracking, and all that sort of thing; then those can be instructors for the rest. There is no officer in the Army knows anything about it except Baden-Powell, who has written a book, and I do not know that he knows anything himself. He has had some practice, I believe, under scouts out in Rhodesia, and probably he is the only man who has any idea about the art at all.

17747. You mentioned that our troops fired by regulation, and the Boers by the head; that is to say, that the British Army generally go on the regulation, and they fire in a great measure as if they were firing at a fixed target, without regard to the circumstances of the place or of the moment?—Yes.

17748. While the Boer takes advantage of anything and everything that he can?—Yes, he will probably creep about for half an hour, without firing at all, whereas our men would fire, and go on firing.

17749. And there is no reason why the British troops should not be so trained and educated, is there?—I daresay we could train a great number of them. I will tell you a story about a man at Naauwpoort. He belonged to the Cork Militia, which had just come out, and he was on outpost. An officer who was commanding the outpost went round to see what the men were doing, and he asked this man what he was doing, and he replied: "I am looking out for the enemy." The officer asked, "Do you know where the enemy are?" and he said, "No, but I am looking for them." The officer then said, "They are in those hills," and the Irishman then said, "Be jabbers, you don't say so," and he started and loaded and fired at the hills for about half an hour, until he had fired all his ammunition away.

17750. You would have a change with regard to that, then?—Yes, that man was very keen; he knew he was there to find the enemy, and directly he heard where they were he began firing. That is a perfectly true story.

17751. Then speaking of the staff and the staff officers you said, "And worst of all they are often deficient in common sense and unable to give an opinion on any strategical or tactical problems." Do you consider they are men who ought not to have passed out of the College as being qualified to take positions on the staff?—No, the men might very easily pass the examination.

17752. Yes, but should they be recommended for that purpose with the testimonial—or whatever it may be—that they are fit for staff purposes?—Well, I think a great many of them I would not care to employ on the staff.

17753. Then you think there is a defect in that respect in the College and in the education and training given in the Staff College?—I think a man might very easily pass the examination, and yet not be a good strategist or tactician.

17754. And not a man of good common sense?—You might take a hundred and not get one who would be any use in that respect.

17755. Are they not reported on from the Staff College?—I do not think the course at the Staff College or passing the examination to pass out of the Staff College would make a man a good General, for instance. Why should it? He might have a good general knowledge, but he would be no use. I think it is the same in every profession, is it not? You get barristers who pass examinations, and so on, but it is not necessary that they are all made Lord Chancellors. They have a knowledge of the thing.

17756. Still, there must be some defect in the system when a large number are so deficient as this statement in your précis imports: "And worst of all they are often deficient in common sense"?—Well, I think they are. I sometimes wanted advice, and I said, "What do you think about this?" and they did not know. I do not care what you are doing, you sometimes want someone else's advice—of course, I cannot mention names, but that is what happened. I do not mean to condemn the Staff College altogether, although it is rather the system in the

Army to condemn the Staff College. I think they are stuck too much in the Staff College, and they want to go away, at all events, after their course is over, for a practical course.

17757. And be a regimental officer?—No, more to work in the field with the staff of divisions, and so on; I think myself that is what they want. I think they had a very fine training in South Africa, but that is rather an expensive sort of training.

17758. (Sir Frederick Darley.) They learn theory in the Staff College, and you think they ought to learn the practice afterwards?—Yes, I think they cannot learn the practice in the Staff College. How can they?

17759. (Lord Strathcona and Mount Royal.) Still, it is useful?—Yes, of course; that is what I mean. I do not think they get the practice in the Staff College.

17760. (Sir Frederick Darley.) Just as the barrister you speak of learns theory from his books, and practice in the courts?—And I do not think even after all that it is a necessity for every man who is passed out of the Staff College should be a first-rate staff officer.

17761. No, but you find a great many so?—I think there are a great many so, but there are a great number who are not so.

17762. (Chairman.) Is there anything you would like to add?—No, only about relieving the officers from all sorts of duties, such as paying the men, clerical work, and that sort of thing, which takes up a great deal of their time, and which renders them liable to great pecuniary loss if they are not financiers.

17763. (Sir Frederick Darley.) Has the colour-sergeant had any experience in account keeping?—No, and it is his business to teach the men as well as the officers; they call them pay sergeants, but, as a matter of fact, it is always the colour-sergeant who is the pay sergeant. An officer can make anyone in his company the pay sergeant, but it is generally the colour-sergeant, as there is a shilling a day extra pay attached to it. I would relieve the officers of all that kind of work, and it would simplify matters, because the accounts would only pass through one hand; let every regiment have a paymaster who does the business of paying the men, and he might also assist the commanding officer and adjutant; he would be a sort of second adjutant, so that the adjutant of the regiment could be out in the field, and not stuck in the office all day long as he is now. Anything that would relieve the officers and the men, and give them time to stick to their regimental work—soldiering—would be an improvement.

17764. It used to be considered that the adjutant was responsible for the training of the men?—Yes, he drills the battalion, not the company; the officer commanding the company is responsible, but when these companies are in the battalion, then it is the adjutant who trains them.

17765. If the adjutant is in the office all day how can he do that?—He has a morning parade from 7 to 8, and then the orderly room begins at 9, and he does not get out again until 11, when he has probably another parade, if the commanding officer has a parade, and then the whole of the rest of the day is office. The extent of the correspondence and the returns from the regiment which have to be kept up is enormous, and the adjutant is responsible for all that. I would make the paymaster responsible for all that work, and also paying the men.

17766. (Lord Strathcona and Mount Royal.) You spoke of the great extent of the sickness. Do you consider that that was owing greatly to insanitary conditions which could have been prevented?—No, at Bloemfontein it was owing to the want of tents, which we had not got; the men were lying on the ground in terribly wet weather, and also owing to the very severe march we had had.

17767. But the conditions of transport at that time were such that it was impossible to have the tents?—Quite impossible. We got them as soon as the bridge at Norval's Pont was opened.

17768. It was not preventible at the moment?—No, it could not be helped.

Lieut.-Colonel ARCHIBALD MURRAY, D.S.O., called and examined.

17769. (Chairman.) You were first Deputy Assistant Adjutant-General for Intelligence with Sir George White?—Yes.

17770. And you were present at Talana?—Yes.

17771. After that you took up your duties in Ladysmith during the siege?—Yes.

17772. After the siege, where did you go?—I joined the new division, the 10th Division, formed under General Hunter, as Assistant Adjutant-General and went to the relief of Mafeking.

17773. And after that?—I crossed from the Mafeking Border to Heidelberg with the 10th Division, and there I joined the staff of General Sir Ian Hamilton as Assistant Adjutant-General—we changed staffs really—General Hamilton broke his collar-bone and General Hunter took his place, and it led to a change of staffs. From that time up till January, 1901, I was with General Hamilton.

17774. Then you went home?—I was temporarily attached to Lord Roberts' staff, and came home and got command of my battalion in India. I went to India and my battalion was ordered to South Africa, and I went back for the second time to South Africa in the capacity of a battalion commander.

17775. And there you were wounded?—Just at the end of the war, last April.

17776. The greater part of your service in South Africa was as an officer on the staff?—Yes.

17777. For Intelligence principally?—I was not very long in the Intelligence Department, only till the end of the Ladysmith siege, after that I was a staff officer, Assistant Adjutant-General, and had nothing to do with Intelligence.

17778. At the time you were at Dundee what arrangements were there for Intelligence?—I was sent up to join General Penn Symons as Intelligence officer, and a small nucleus of Colonial farmers were given me to work with, and I started the Intelligence for General Penn Symons there, working in conjunction with the Ladysmith Intelligence Department. I had a certain number of farmers who were joined to my staff, and a certain number of Basutos. We were in touch all along the Natal border with the advancing columns of Boers, and knew exactly every movement of theirs. We had full information.

17779. How do you mean that the farmers were attached to your staff?—The farmers were civilians, of course, working under me as Intelligence agents, and I also had a few Basutos with me.

17780. What did they do—go out as scouts practically?—A few Basutos would go with one of these farmers, and they would assist the farmers, and scout for them, or lie in places where a white man would be noticed but a Basuto would pass unnoticed.

17781. That was the system by which you collected information?—Yes, apart from the cavalry work.

17782. That was your own particular branch?—Yes.

17783. And you think you got full information?—I only went up on Sunday, and Talana was fought on Friday, so that we had not long to inaugurate the system, but knew fully what to expect from the advance of the columns from the north and the west, at least my General knew fully what to expect.

17784. And you accompanied that column back into Ladysmith?—I changed my capacity rather; I was the senior unwounded staff officer, and I did more the executive work as Assistant Adjutant-General. The intelligence work was not so necessary then, and I was doing Assistant Adjutant-General work.

17785. You did not require much intelligence?—No, beyond the scouting round the column, and seeing to the safety of the column. I still had these excellent farmers with me, who acted as guides and did a great deal of scouting for me.

17786. The farmers proved useful?—They were a most excellent class of men, the Northern Natal farmers.

17787. Were they British?—All British.

17788. In Ladysmith you were again Intelligence Officer?—I was constantly taken away from my Intelligence work; the Intelligence Staff was very strong there, and under very capable direction, and I did a

great deal of executive work on the staff there. For instance, on the 6th January, and after the 6th January, I was entirely attached to General Hamilton's staff on Caesar's Camp for work outside Intelligence work—staff work.

17789. But you knew the organisation of the Intelligence?—Yes, I worked for three months in Ladysmith.

17790. What was the organisation of the Intelligence Branch in Ladysmith at that time?—There was an Assistant Adjutant-General for Intelligence, Major Altham, and two Deputy Assistant Adjutant-Generals for Intelligence, Major David Henderson and myself; we had an excellent Corps of Guides, mostly composed of farmers, and we had a large staff of natives who were in touch with the Boers and communication with us, when we could get the information in; there was a network of natives and a great many of the native chiefs were in communication with us from the outside.

17791. I suppose it was not very easy to get the intelligence in?—Sometimes we would wait five or six weeks before a native chief could send in an agent to us, but at the same time the Intelligence Department was of use to Sir Redvers Buller, as it enabled Sir George White to tell him most of what went on behind the scenes, as it were, on the Ladysmith side. We could tell the movements of the Boers north of the range of the Colenso Hills, for instance.

17792. That was valuable for Sir Redvers Buller?—Yes, because we sent the information out two or three times a week by pigeon, until the heliograph was working, and then we sent it out every day.

17793. Information you had gained?—Yes, by movements of Boers, either visible movements owing to our having five or six telescopes going with a large radius of action, or from what we gathered from our own agents. Every day that information was sent out.

17794. We know that one of Sir George White's difficulties was that his plans were apparently known to the enemy. Did that fall to the Intelligence Branch to deal with?—No, not entirely; it fell to us to try to stop it, and see where the leakage occurred.

17795. That is what I meant?—Many times we tried to ascertain the leakage, whether it was done by signal or runner. It was rather a big community to watch, and a very big perimeter, and the Intombi sick camp made it especially difficult. That is where the refugees were. They were on the perimeter of our defence, and I think that communication through Intombi was possible, and it was very difficult for us to prevent information going out with the sick to Intombi.

17796. Was that the special duty of the Intelligence Department?—No, not more than trying to find out where the leakage did occur.

17797. Do you think you were able to stop it?—No, I think there was information going out right up to the end, but I do not think it was as much as was thought, nor do I think it was done by signalling by lamp or adjustment of lights in windows. That is a very simple plan and very hard to detect, as such a signal might convey information to those outside, and still be very innocent in appearance to those inside.

17798. Was that supposed to have been going on?—Yes, that no movement took place without a certain adjustment of lights which could be seen from the Boer perimeter, but we traced a great many of them, and as far as we could see they were from natural causes.

17799. Do you think an organisation like that which you have described—with farmers and natives—is a satisfactory organisation for Intelligence?—We were working at that period of the war with, you might say, a trained Intelligence Staff, Major Altham and Major Henderson being both trained men; we had very good men, and were working on a small scale. Later on in the war we were working on a large scale over very big country, and we were not able to demand the same number of trained skilled Intelligence Officers. I think we suffered during the war through the want of trained men in the Intelligence Department, not only to collect, but to collate and get the information down into a useable form. I think highly trained officers are wanted for that.

17800. Special training beyond the ordinary staff training?—The ordinary staff training is useful, because it teaches them exactly what points to look for. I think

Lieut.-Colonel
Archibald
Murray
D.S.O.

11 Mar. 1903

Lieut.-
Colonel
Archibald
Murray,
D.S.O.

11 Mar. 1903.

the man who is an intelligence Officer is more or less a specialist, but he wants the ordinary staff training to graft it on to.

17801. How would you get him the special training?—Nearly every officer in the Intelligence Department now is a Staff College officer, and he has the special training of the Staff College, and the special training of the Intelligence Department. During the war the difficulty was that it was not capable of rapid expansion to suit a big theatre of war.

17802. The work of the Intelligence Division in London is in a separate branch from the work of the Intelligence Officer of an army in the field?—Yes, but most of the Intelligence Officers from the War Office were in the field, and were trained to Intelligence work, collating and collecting evidence.

17803. But surely the work in the office of the Intelligence Division would not be the only means of training an officer for Intelligence work in the field?—No, they can be trained with the different corps in India, and with the different staffs of the Army. At the present moment, I think, that is being done.

17804. Has that been done in the past?—I do not know; in India it is done, but I do not know how far it has been done at home.

17805. May I ask if you have had any training?—The only training I had for Intelligence work was that I had an intimate knowledge of South Africa before the war, having been there five years. I knew the country very well, and had been in Natal and Zululand for three years. I was sent out as Intelligence Officer because of my knowledge of the country and the Boers, whom I knew very well. Apart from that I had no special training beyond my Staff College training.

17806. For an Intelligence Officer in operations in different parts of the world you generally require a man who knows the different localities?—With local knowledge, yes. At that same time, I think, that an Intelligence Officer ought to be trained in certain ways as to what he is to get, and the best ways of getting it, and then, when he has got the information, the best way of collating it, so as to put it before the man who has to use it. All that requires training.

17807. All that can be got on the staff of the General?—To a great extent it can. I think an officer can be trained to write concisely, and to digest what he gets, and to study methods of getting it, because, after all, what is wanted is to put the matter shortly and clearly before the General—the vital points, and not reams of stuff.

17808. Every General in command of a column ought to have an Intelligence officer with him on his staff?—It is absolutely important—of vital importance.

17809. Who would collate the information and have scouts under him, and put the information before the General in a form on which he could act?—Yes, the Staff Officer would put it before the General in a form he could work on.

17810. Is there sufficient provision for that in the Army as it stands?—I think the Intelligence Department wants largely augmenting; it is a difficulty in peace time, as these large staffs for Intelligence work cannot be kept everywhere in peace time, but it is a department that wants to be organised, so that in case of war it could rapidly expand to meet the circumstances of the case. Certain named officers might be on a list, for instance:—"List of officers available for South Africa with experience who would be suitable for the Intelligence Department."

17811. That means that different officers ought to study in different parts of the world?—There is no doubt that they ought.

17812. You are prepared to speak in the first place with regard to the efficiency of the organisation of the Army?—I have said in my *précis* (see Q. 17816) that I never saw any brigade or any division organised in peace that took the field in war; all the brigades and divisions that I saw and worked with were organised during the war.

17813. You mean that the Army Corps that went out, for instance, never acted as an Army Corps?—That particular Army Corps I never saw at all; I may have seen parts of it afterwards, but the troops I first worked with were battalions, squadrons, batteries, and staff put together at the required moment.

17814. The theory, I suppose, was that a division or a brigade, or an Army Corps, sent out from this country

would work under those denominations?—Yes, but the circumstances were too strong for the theory.

17815. Did they suffer in consequence?—I can only say that I think it would have been better if the organisation had existed in peace time too, but I think it speaks well for the material of the battalion, battery, and regiment that such excellent work was done with an organisation hurriedly put together.

17816. You have been good enough to give us some notes which you now put in?—Yes:—

1. During the war I never saw any division or brigade that had existed in peace, but I saw several brigades and divisions formed during the war. As the exigencies of the service demanded it, squadrons, batteries, battalions, ammunition columns, etc., were put together to suit the particular circumstances of the case. Though a far from satisfactory method, the result, in my opinion, proved how really sound the organisation of the regiment, battery, and battalion is, otherwise the brigades and divisions could not possibly have formed the useful fighting forces that evolved from this hasty formation. The difficulties of emergency organisations are found, not in the putting together of squadrons, batteries and battalions, but in obtaining the requisite medical services, ammunition columns, supply and transport services to accompany the fighting arms. From a considerable experience during the war, I think the greatest praise is due to the officers of the artillery, medical, transport and supply branches of the Headquarters Staff for the able manner in which they coped with large and urgent demands to complete divisions hastily required to move out to take the field. The difficult work of the Staff of the General Officer Commanding Artillery, called upon urgently to improvise an ammunition column to carry every kind of ammunition for 4·7 guns, 5-inch guns, 6-inch howitzers, 15-pr. Elswick guns, Canadian guns, pompoms, and infantry ammunition, must have been seen to be appreciated. The principal medical officer, though hard pressed for field hospitals and bearer companies, never once sent any force, with which I was connected, away with insufficient medical units. Other officers are better able to go fully into the question of the supply and transport services, but I should like to say a word of praise for the junior officers of the Army Service Corps who were ever ready to accept responsibility and to cope with a difficulty. The same may be said of the young officers of the Royal Engineers.

2. I am strongly of opinion that infantry cannot carry a position in the face of the modern rifle unless assisted up to the last moment by artillery fire.

I advocate the employment of mounted infantry, and welcome this force on the battlefield to threaten and envelope the enemy's flanks and so set free the cavalry for wider turning movements and more independent action. It is essential for the thorough training of the Army that all arms should be exercised together.

No one arm is complete in itself, and the different branches must constantly train together. In my opinion all peace stations for single units should be done away with.

3. With regard to the training of officers, I am a strong advocate for as many officers as possible passing through the Staff College, and as I do not think the present two years' course could be with advantage shortened, I should like to see the number of instructors and students at the Camberley Staff College very much increased. I do not think a competitive examination always secures the best men for the Staff College, and I advocate in its place a qualifying examination to ensure a high standard of general and military education, and the students to be selected or nominated from those qualified. Carefully framed regulations would be necessary for this selection or nomination. From an experience of many officers working on the same staff as myself I am certainly of opinion that given two men, one Staff College and the other not, of equal soldierly qualities, the Staff College man is the most useful, for he has studied method, conciseness, and has acquired a useful technical knowledge of all arms. In order to increase the number of trained staff officers, during the period of Division and Army Corps training, selected officers should be trained for staff work in the field, under existing staff officers. The training of the young officer with his unit is not a difficult matter so long as he has received a good education, but becomes a heavy responsibility on his commanding officer when he is poorly educated. Many regiments are feeling this very much at the present time. To teach young officers to act on their own initiative and to think, their daily outdoor military work should be always based on some

Lieut.-
Colonel
Archibald
Murray,
D.S.O.

11 Mar. 1903.

small military problem to be solved practically on the ground. By this means officers and men learn to think for themselves, and all ranks work with a keenness which is absent from work of a perfunctory kind.

4. With regard to the training of the men, considering the class the recruit is drawn from, their general want of education, and the fact that they join the Army at any time of the year, I am of opinion that three years is not sufficient time to train men to the necessary standard requisite for the small highly trained Army that we require. I recognise that this short service has been introduced to obtain the necessary numbers for war without undue expenditure during peace, but I am of opinion that the quality of battalions, regiments, and batteries will not be of such a high standard as when men had seven years' training before they passed to the Reserve. To make the three years' service system a success the recruit on joining must be more developed mentally and physically.

17817. The difficulty was not so much in putting the regiments together, but in getting the field services necessary?—That is a point I laid stress on rather, and it is very easy to put eight battalions together and make a division, but the difficulty comes in where it is necessary to arrange for the supplementary services like the ammunition column and the medical people.

17818. And that, you think, was well done?—I only speak from the experience of two or three times having to start the reorganisation of a division, and on every occasion the Royal Artillery staff did exceedingly well, I thought; it was very difficult to form the ammunition columns for all classes of guns, Elswick's, Canadian batteries, etc.

17819. But they did do it?—Exceedingly well, and the same with the medical service.

17820. The medical service was complete, as far as your experience goes?—I know they were very hard pressed to find the services we required for our divisions, but on no occasion did they send us out without adequate medical provision—enough to get on with.

17821. With the use of different arms under modern conditions, infantry, you think, cannot carry a position without artillery fire?—I think no one arm is complete alone; I think, in face of the modern rifle it is almost impossible for infantry to do the last 200 yards unless strongly supported by artillery fire up to the very last moment, unless it is in the nature of a surprise by night, fog, mist, or something of that kind. In daylight, I think it is impossible. At Talana the infantry would never have got to the top of Talana Hill if the artillery had not fired until even our own infantry suffered by it.

17822. We have had some evidence that, in addition to the shrapnel, there ought to be common shell?—I think all batteries ought to carry a certain number of common shell; they used to do it; it does not want a very large proportion, and I think all batteries ought to carry it. It is useful against material.

17823. As to mounted infantry, do you think that would be as important in other wars as it was in South Africa?—It was absolutely important in South Africa, but I think it would be very useful in any war in any country, not to replace cavalry, but to give a mobile infantry—an infantry capable of quick movement.

17824. And with regard to the training of officers, have you anything to add to what you have given us here?—No; with regard to the training of senior officers, I am a very strong advocate for the Staff College training.

17825. You think that as many as possible should be passed through the Staff College?—Not to make it for the few, but the many, and the more the better that go through.

17826. But it is no use sending a man to the Staff College unless he is capable of benefiting by it?—Therefore, I advocate a high educational qualification before a man is sent there; he wants to be a well-educated man in every way to take advantage of the training.

17827. Is not that the case now?—Yes; at the present moment they are admitted by competition, most of them, and the best educated men are got to go there, I think, for that reason. At the same time, you may get a very well educated man and a very clever man, who does not make a very good staff officer.

17828. After he has been through the Staff College, what do you think ought to be his course? Should he continue on the Staff, or go back to his regimental work?—I think he ought to go backwards and forwards

until he has done his period of the command of the regiment, battalion, or brigade division of artillery.

17829. The regimental work is quite as necessary to train the senior officer as staff work?—I do not think a good staff officer will ever be obtained who is not thoroughly in touch with the regimental work, and to get that a man must go through it himself. I do not think the Assistant Adjutant-General with a division can thoroughly sympathise with the battalions, unless he has gone through it himself and commanded a battalion, and then he knows what the difficulties are.

17830. And the younger officer?—The younger officer, I think, can be trained easily enough in the regiment, as long as he has a good education to start with. What we are suffering from now is commissions being given to men who have not the necessary education to enable them to take advantage of a military education and get on with the military subjects.

17831. You mean just at this particular moment, in consequence of the war?—Yes, during the last few years, and we are beginning to feel it now.

17832. Do you think the ordinary young officer in a regiment does do his best to equip himself with military knowledge?—I think it entirely rests with the Colonel commanding the regiment. The young officer is quite willing enough to work as hard as he is required, as long as the Colonel knows what line to take, and puts him in the right line; it rests entirely with the regiment.

17833. If he is put on the right line, granted a fair capacity, he can be trained into a good officer?—I have no doubt of it, or, if he cannot be trained, he ought to be got rid of. It rests entirely with the commanders of regiments.

17834. With regard to the training of the men, are you satisfied with the class of men you get now?—No, except in exceptional cases; I think the Guards' recruit is a fine recruit, but I do not think that the infantry recruit is mentally or physically what we shall want for a three years' soldier.

17835. A good many witnesses have said that the soldier we now have in the ranks developed in the war into a very good man?—Oh, yes.

17836. With sufficient intelligence?—That was not the point I wanted to impress upon you; the men I had in the early part of the war were men who had been abroad, I suppose, on the average, four or five years, and there were no Reserves at all.

17837. Those were the men from India?—India or the Colonies. Then the next battalion I was with were nearly all regiments from home, with Reserve men, and, of course, they were older and steadier, and fine men, too; and, finally, I went from India with a regiment entirely composed of what you might call long service men. I had 500 men going on for twelve years' service, and I saw all kinds in that way, and they all made good regiments, each in its own particular way. But I do not like the idea of only a three years' service in the ranks.

17838. I was speaking more of the intelligence of the class, and the intelligence of the class will not alter because a man has been in peace time for several years in the ranks?—I think he will develop.

17839. You can develop the intelligence?—Yes, in the same way as the physique of these immature boys who join can be developed.

17840. You would say the men you now get into the ranks would have sufficient native intelligence, if it could be developed?—Given the requisite time, which the seven years did give.

17841. (Sir Frederick Darley.) You mean that for the class of men we get three years is not sufficient?—We want a very high standard for our small army, and I doubt our being able to get it by men staying three years. The physique of the recruits is so poor that for the first year they are not able to take full advantage of their military training, and that really only leaves a two years' course of training.

17842. (Chairman.) A good deal has been said of the intelligence of the class, and it has been argued that if you had a more intelligent class, you could do with a smaller army. As I understand you, you think the class we now get, if it has sufficient time for training, can be made into an intelligent soldier?—Yes; I think the class we are now getting, given sufficient time, can be made into an intelligent soldier, but if the period is to be reduced to three years, then I think a class superior

Lieut.
Colonel
Archibald
Murray,
D.S.O.
11 Mar. 1908.

will be wanted to take advantage of the three years to equal what we have got at the present moment.

17843. Have you anything to add?—No.

17844. (*Lord Strathcona and Mount Royal.*) Would you be good enough to explain the difference, as you regard it, between a competitive examination and a qualifying examination?—In a competitive examination the men that make the most marks gets into the Staff College, in a qualifying examination a fixed standard is reached by a certain number of men.

17845. Do you consider that the examination at present is not sufficient to show the qualification in education of those entering the Staff College?—Yes, I think it is quite sufficient to show the qualification, but the point I raised was that I did not want a competitive examination for the Staff College. I wanted a qualifying examination to get a certain standard, the men to be nominated from this list of qualified men.

17846. How would you ascertain those who are qualified?—I would have an examination test, but not a competitive examination, that is to say, the men reach a certain standard in an examination.

17847. Those who have been in the universities, or otherwise qualified for the position?—They have very

much the same examination at the present moment, but at present it is a competitive examination, that is to say, a certain number at the top of the list get in; I would rather have a qualifying examination, so that a certain number of men, five or six times the number, reach a certain standard, and are regarded as being qualified, and from these qualified men I would select.

17848. In enumerating the guns, I see you mention amongst others the Canadian guns. Did they differ in any way from the ordinary guns?—They were a horse battery gun, and they had neither the mobility of the horse artillery, nor had they the power of the field artillery, so that I would say they were not entirely wasted, but their place would be better taken by a battery of field artillery.

17849. (*Sir Frederick Darley.*) Speaking generally, the junior officer during the war displayed every quality necessary for an officer?—Yes, I have a great respect for the junior officer. I always found him ready to accept responsibility and generally able to carry out intelligently anything he was given to do. I am speaking of the most junior ranks.

17850. The subalterns?—Yes, and captains.

17851. That was your experience of the war?—Yes.

(*After a short adjournment.*)

Major-General Sir H. M. L. RUNDLE, K.C.B., K.C.M.G., D.S.O., called and examined.

Major-
General Sir
H. M. L.
Rundle,
K.C.B.,
K.C.M.G.,
D.S.O.

17852. (*Chairman.*) You have been good enough to send us some notes (*Vide Appendix, page 664, post*) upon which I will ask you questions. When did you go to South Africa?—I sailed with the first of my division on the 9th March, 1900.

17853. Where did your division go to in the first instance?—It first of all went to Cape Town, and we landed a portion of it there. At that time the relief of Mafeking was in the air, and Lord Roberts ordered my division to proceed to Kimberley, and those were the first orders I received. But while they were in the course of disembarking the Wepener incident occurred, and the pressure became so great in the south-eastern portion of the Orange River Colony that I was diverted to Dewetsdorp and Wepener, and General Hunter was brought round with his division from Ladysmith to accomplish what was first given to me. My troops, instead of all landing at Cape Town, were landed partially at Cape Town, partially at East London, and partially at Port Elizabeth, which I conclude was done for the facility of moving them up country quicker, as the railway was somewhat congested at Cape Town.

17854. And after that you had command of the south-eastern portion of the Orange Free State?—Yes.

17855. What was the special object you had in view?—The special object given to me by Lord Roberts, which he impressed upon me in a personal interview that I had with him, as well as by written instructions, was to prevent any recurrence of the Wepener incident, and he also impressed upon me that any advance on Cape Colony while he was moving forward with his main force would seriously complicate matters so far as he was concerned, and that object up to the fall of Pretoria (which, I understand, is all I am giving evidence about) was what I kept before me during the whole time, viz., to prevent any attempt of the enemy to get down into the Cape Colony.

17856. And you held that position up to the taking of Pretoria?—Up to the taking of Pretoria.

17857. What troops had you?—I had my own Division, which was at first short of one battalion, the Leinsters, which had not arrived at the time we advanced. I had eventually given me in addition the Colonial Division and about 800 Yeomanry.

17858. What does the Colonial Division mean?—The Colonial Division was organised by Lord Roberts when he went out there. He selected General Brabant, a very distinguished Colonial soldier, who organised this Division under Colonial officers, with a certain number of Imperial officers as Staff officers.

17859. These were South African Colonials?—South African Colonials. They consisted of the Cape Mounted Police, the Kaffrarian Rifles, and several corps of that sort.

17860. They were not over-sea Colonials?—No.

17861. And what was your opinion of those troops?

—I have the highest opinion of their fighting qualities, their knowledge of the country, and their general capability of looking after themselves in almost every circumstance, and in those matters they were absolutely and invariably invaluable to me.

17862. (*Sir John Edge.*) Did you find the discipline of the South African Colonials equal to that of the British Army?—Yes, when they were commanded by Imperial officers, or officers who had been in the Imperial Service, and I would specially mention in this instance Brabant's Horse, commanded by Lieut.-Col. Grenfell. I should like also, in this category, to speak in the highest terms of both regiments of the Imperial Light Horse, one of which, I ought to say, was commanded by an Imperial officer, and one by a Colonial, which is an exception to what I have just said. They had a tendency to over-transport, which was very difficult to control.

17863. (*Chairman.*) And the Yeomanry that you had, what were they?—They were a most interesting force. They were composed of hunting men, steeplechase riders, and every description of riding man almost in the country.

17864. Was that the first contingent?—That was the first contingent. I had several commanding officers, Members of Parliament, masters of foxhounds, whom I can only speak of in terms of the highest admiration for what they did, their intelligence, and everything about them.

17865. Did they remain with you throughout?—They remained with me throughout the whole of the period we are now talking about, and for a very long while afterwards.

17866. The first contingent of Yeomanry, of course, began to go home, did they not?—Not for some time after that. I did not lose my Yeomanry until, it must have been, a year and a half, nearly two years, after the time I am talking of.

17867. They were enlisted for a year?—Or the war? There was a question about that; it is a contended point, which perhaps the Commission would like to hear about.

17868. We have heard all that?—But the result with me was that they remained over their year, and, in fact, very considerably over, and there was considerable discontent in consequence; but, I must honestly say, it did not affect their fighting qualities, or their working qualities, so far as I was concerned.

17869. And you had a great many of the Reservists in your Division?—Yes, my Division was principally composed of Reservists.

17870. And the Reservists, you thought, did well?—Admirably; a most excellent body of men. They were men of a certain age, who had given hostages to fortune; they were really the backbone of the force that went out, in my opinion.

17871. (*Sir Frederick Darley.*) How long had the bulk of those Reservists been away from the colours?—I could find that out for you. I could not say off-hand. That you could easily get from the statistics of the War Office.

17872. I thought, perhaps, you might have known?—No, I do not.

17873. (*Viscount Esher.*) Did you find that class of Reservist differ from another?—No, not a bit.

17874. (*Chairman.*) We have heard from some witnesses that the Reservists, having been away for some time from their regiments, were not quite acquainted at first with the modern conditions or even with the rifle that they were called upon to use; did you find any difficulty in that respect?—None. I never found any difficulty. Of course, naturally, there was a certain amount of rustiness; but that must be expected. It was fully made up by the increased intelligence and the extra age of the men who came back, and it very soon wore off. Would you like to hear what a commanding officer of the Guards said? This is one of my Guards' battalions. "The quality of the men, I think, could not have been improved upon. Shooting was good, intelligent, restrained, marching could not have been better. There was no falling out, except when camp came in sight for the purpose of collecting cow-dung, fuel" (that was one of our difficulties, there was no wood), "and avoiding various fatigues on arrival, which was easily checked." I had another officer commanding a battalion of Guards, who speaks of his Reservists in the highest terms—Colonel Lloyd. I cannot turn his letter up at the moment, but it is to the effect that he really depended on his Reservists. I should like to state that the whole *esprit de corps* and the discipline of the Guards' battalions are magnificent. The Guards are so impregnated with the idea that they are the Guards of the Queen, as they then were (now of the King), that it influences the whole of their duties from the simplest to the biggest. I had two battalions of them under my command for two years.

17875. You attach considerable importance to *esprit de corps*?—Enormous importance.

17876. Do you think that has fallen off of late years in the Army?—No, I cannot say that I think it has.

17877. We have been told that there is not so much inducement now for a soldier to feel for his regiment as there was under the old system?—I think it depends upon the regiment; if you get a good regiment you get *esprit de corps*; if you get a bad regiment you do not get any; if you get an ordinary regiment you get very little. I do not think, myself, *esprit de corps* is any worse now than it was 20 years ago; in fact, I think it is better.

17878. Does the territorial system lead to *esprit de corps*?—Enormously. I had the Manchester Regiment under my command and the Staffordshire Regiment, and the people of Manchester and Staffordshire took an interest in everything connected with their battalions; with the men of the battalions their one idea was to go back to the county from which they came proud of themselves and their regiment. I think the territorial system has had a very good effect. That is my experience of it.

17879. And as to the different capabilities of the men; has the shooting improved, do you think?—It is a very curious thing, but the shooting of the Boers was much worse than it was in 1880 and 1881. I do not think that the shooting of the Boers this time was very much better than that of our own men; but the difficulty, of course, was that there was nothing to shoot at.

17880. Because the Boers kept under cover?—And also because smokeless powder has introduced a new factor. There is really nothing to shoot at, and, therefore, you cannot say that a man shoots badly when he is shooting at nothing. We seldom had anything to shoot at except features.

17881. And with regard to the marching, have you anything to say about that?—The marching was excellent. The only thing was that we took men off ship, and, naturally, we could not rush them into marching; but when the men got settled down we could have marched them anywhere and gone any length we liked. That all my commanding officers were unanimous about. The men responded to every appeal made to them. One battalion marched 45 miles in 48 hours, and fought a successful action at the end. That was at

Prinsloo's surrender, when we joined hands with General Hunter.

17882. (*Sir John Edge.*) Have you any objection to mentioning the name of the battalion?—It was the Royal West Kent.

17883. (*Chairman.*) What have you to say as regards horsemanship?—The horsemanship of the Colonial troops was excellent, it could not have been better; and also that of the first lot of Yeomanry, for the reasons that I have given in a previous answer.

17884. You had no cavalry?—I had no regular cavalry ever under me.

17885. And the horsemastership was not so good?—The horsemastership was very bad.

17886. Throughout?—I think so. Not of the Colonials, of course; the Colonials understood the animal of the country, and treated him accordingly. But the horsemastership of the Yeomanry was very indifferent, and it was almost impossible to get the men to get off their horses when they halted; they would sit upon them for half an hour unless somebody told them to get off.

17887. I think you had some difficulty in getting the troops to take cover?—Yes, we had. I wrote a memorandum on that subject, which I thought the Commission would like to see, as it expresses my views.

17888. If you please?—It is a memorandum which I wrote to my Commanding Royal Engineer, dated June 13th, 1900:—"According to telegrams I have received from Lieutenant-General Kelly-Kenny, who has assumed command of all troops he can communicate with, it is quite possible that a crisis has arrived in the present war; it is essential that I should have a portion of my force mobile. This can only be done by making the posts, which I have left, secure and defensible from a modern point of view. For this reason I deputed to you the duty at Ladybrand and Thabanchu of organising the defences of those places. I take it for granted that Ladybrand and Thabanchu are in a position to stand a siege; that the defences are so constructed that they will give protection against modern guns, and that they are capable of making a prolonged defence. I now wish you to do the same at Ficksburg and Willow Farm, and when these are completed to proceed to Hammonia, and place it in a state of defence in accordance with the instructions issued by the Field-Marshal Commanding-in-Chief (Chief of Staff Circular Memorandum No. 17, 'Instructions for Officers Commanding Posts in the Orange Free State'). After you have done this you will report to me through the Chief Staff Officer. I may add that up to date I have failed to see any intelligent use made of entrenchments by Brigadiers or by the troops under their command; they appear to think that a few stones hastily gathered together or 6 in. of earth hastily scraped up at haphazard is adequate protection against modern gun and rifle fire. They possess in their commands educated officers, who, in passing for promotion, Staff College, and other courses prescribed by the Regulations, must have been taught theoretically very differently from the practical outcome of their work in the field. I feel sure that the defences you have organised at Ladybrand and Thabanchu will not come under the criticisms I have felt it necessary to make as regards other positions. I am sending a copy of this memorandum to Brigadiers, with directions that your orders on the subject are to be considered as coming from myself."

17889. With regard to Ladybrand and Thabanchu, which are mentioned in that memorandum, could you give us some particulars?—The paragraph in that memorandum, in which I stated to my Commanding Royal Engineer that I took it for granted that Ladybrand and Thabanchu were in a position to stand a siege, and that the defences were so constructed that they would give protection against modern guns and they were capable of making a prolonged defence, was fully justified some months later, when the garrison of Thabanchu, which consisted of two companies of the Worcesters and one company of Imperial Yeomanry, successfully resisted a siege by 3,000 Boers, with artillery, for some days, until relief arrived under General Bruce Hamilton from Bloemfontein.

17890. You consider that British troops have an antipathy to forming entrenchments and cover?—I would say, as a general statement, that British troops have a curious antipathy to forming entrenchments and cover.

Major-General Sir
H. M. L.
Rundle,
K.C.B.,
K.C.M.G.
D.S.O.

11 Mar. 1903.

Major-General Sir
H. M. L.
Rundle,
K.C.B.,
K.C.M.G.,
D.S.O.

11 Mar. 1903.

17891. And you think that view is shared by the officers?—That view is undoubtedly, to a great extent, shared and fostered by the officers, who, though knowing the immense superiority that entrenchments would at times have thrown into their hands, would for days occupy a position of doubtful strength, without any attempt to entrench themselves, unless they were distinctly ordered to do so. This was true of the infantry, but especially true of the mounted forces. On several occasions it was only by strong measures that I could get the officers and men to entrench at all, and as late as September, 1900, little or nothing of the kind had been attempted at one station, although it had been occupied for a fortnight. British officers of infantry and cavalry are too dependent on the Engineers, instead of taking the work of entrenchment as part of their own job.

17892. They did not understand the tactical use of field works?—They were too apt to forget the offensive rôle, and there was at first a tendency to crowd their men together, which, in the latter phase of the campaign, experience had taught them not to do.

17893. (Sir John Edge.) That is in entrenchments?—In entrenchments.

17894. (Sir George Taubman-Goldie.) You, as a general, hold that entrenching is one of the principal things that a soldier should do?—Yes, I think that he ought to entrench just as naturally as he eats his dinner.

17895. (Chairman.) Were the men capable of entrenching?—Yes, they were capable of entrenching; and, subject to what I have said in the memorandum which I have already read, they greatly improved with experience.

17896. (Viscount Esher.) The whole system of entrenchments is undergoing a considerable change now; that is one of the effects of the campaign, is it not?—That opens up the question of entrenchments. It depends very much upon the ground. If you are digging in clay, or digging in sand, or digging in rock, the work of entrenchment takes such very various forms. A company is sent down on Salisbury Plain to entrench, and it is taught what is thought very good entrenching; it goes to South Africa, and has to entrench on a kopje, and its training on Salisbury Plain is absolutely useless to it.

17897. What do you consider the remedy for that?—I think only common-sense and telling an infantry officer that he has got to entrench. There is no mystery about it.

17898. (Sir Frederick Darley.) And then there is some art, is there not, in choosing the site of the trench?—Yes, but that is one of those things about which there are always two opinions. It is a most difficult question. The point, to my mind, is that they must entrench, and it must be done with the personal superintendence of general officers, and regimental officers, on the spot, and as the circumstances require.

17899. (Sir George Taubman-Goldie.) How do you think the Boers got their extraordinary skill in entrenching?—I never understood how the Boers got anything. I wish you could tell me. It puzzled me for two years. I cannot answer that question.

17900. (Viscount Esher.) Still, I suppose a good many lessons have been learnt, have they not, from the war as to the best forms of entrenchment? There have been new regulations, for instance, issued quite lately, have there not?—Yes, but, of course, the Paardeberg trench, which is the celebrated trench which revolutionised the whole thing, was only a pit about *that* broad (describing), of whatever length was wanted. The earth was dug out and simply scattered to show nothing. A man walked round under cover down in the trench, and he simply put his head over; you never saw him. That would not be possible in certain ground.

17901. (Sir George Taubman-Goldie.) And exactly the same form of trench existed at Colenso?—Did it?

17902. (Viscount Esher.) But in point of fact the men are being taught how to entrench differently from what they were taught before the war; is that not so?—I cannot say off-hand, because we have not begun yet field training. I will look it up. Certainly in my division we adopted the so-called Paardeberg trench the moment we discovered it, and it came upon us like a revelation when we first saw it. We always used to entrench our outposts whenever the ground would allow in this deep trench, with the earth scattered. But that

could not be done everywhere; it could not be done on rocky ground.

17903. (Chairman.) The equipment of the troops for entrenching at the beginning of the war was what was called the Wallace spade, was it not?—Yes, but the Wallace spade is a most benighted article. Nothing ought ever to be put upon the men to carry. We ought to treat our entrenching tools as we do our guns, and they ought to have equal importance in the line of march.

17904. We have had some evidence to the same effect: that there ought to be quite efficient entrenching tools, but that they ought to be carried in a cart. That you agree with?—Quite.

17905. Then, with regard to supplies, your division practically lived on the country?—That is so.

17906. Would you explain how that came about?—We had our groceries, of course, to a limited extent, which I had to more or less curtail, and I seized some flour mills out of which I got a lot of flour; and then I got any amount of cattle, and sometimes I got vegetables. In fact, I took anything I wanted. We required a certain amount of flour, of course, to feed the force in that way. You will understand that the British soldier is taught in England that he is not to touch anybody's property, and is brought up in the right way of going about people's grounds with game and so on, and it took a little time to teach him that he was to look after himself and take anything he saw.

17907. You got flour from the flour mills?—Yes, I took it.

17908. And gave receipts for it?—And gave receipts for it; and in the same way for our cattle that we took.

17909. How did it come about that you had to live on the country; was it owing to deficiency of transport?—I suppose the Director of Supplies only had a certain amount of stuff to supply the main advance with, and therefore I had to shift for myself, which I did. There were great hardships to the men at first, because the British soldier naturally is brought up to expect to march into camp and find his tent pitched and his dinner all ready, and he is very much surprised when he is told that each man must cook for himself. Then there was a deficiency of wood, which was a great difficulty; there was no wood in the country, or, if we came across any wood, it was probably green. That had to be overcome by collecting cow-dung as we got into camp, and the same man who went to bed with very short commons when we first started was able two months after we started to cook his meal. One of the things I would like to bring before the Commission is that it is essential that we should teach our men to cook for themselves and not to be dependent on bully beef and biscuits.

17910. As a matter of fact your division for nearly eight months subsisted on the country?—Not quite; practically from April to August.

17911. And they were well fed?—I cannot say we were well fed exactly, but we were fed quite sufficiently to get along, and there was not an appalling amount of sickness or death. We did not "Jack up." The men suffered, and they grumbled, too, but they accomplished very long distances, and they lived to enjoy the railway when they got to it.

17912. But I thought I understood from your précis that there was a difficulty about transport?—I thought you were talking about the food.

17913. Yes, but I began by saying that it arose out of want of transport; was it not so?—Yes. You see I was ordered to advance when I had no transport at all, and by an accident I took somebody else's transport that I found and carried out my orders; and then we took the transport out of the country as we went along, until, eventually, we had the finest transport, I should think, in the whole of the campaign. We collected it from the various farms that we passed through.

17914. But you began with no transport at all?—Yes. I think we started with some donkey wagons and some mule transport which I appropriated.

17915. Was there none attached to your regiments; was there no regimental transport?—Yes, there was some.

17916. But not enough to carry the supplies?—Nothing like enough. But that was only an incident; it all passed away, and eventually the division became a perfectly self-supporting division with any amount of transport and with any amount of supplies. Really

it was one of the wisest things Lord Roberts ever did, because we tapped all these mills; it was a great question whether 10,000 men could be thrown upon the country in that way; but nothing went wrong over it.

17917. As to ammunition, what is your experience of that?—The ammunition was very good.

17918. And as to equipment?—The equipment was bad. I should like to say that the weight must be got off the men; it is practically always got off; but dealing with the regulations about all this valise equipment, I think the only thing they should carry should be their ammunition and either a blanket or great coat, and a haversack, of course, and water bottle. We shall never do what foreign nations do, get our men along with all sorts of kits and things packed upon them; it is an exploded idea.

17919. We have had some evidence to the effect that the great coat is a troublesome thing to carry?—I think it may be, but if you carry it when you start and you eat out your wagons you can always put your great coats on to the wagons that you have eaten out; and thus use the wagon for your great coats.

17920. One point that was mentioned about the great coat was that it showed, that if a man took cover it was an object?—But they have altered that; it is a khaki coat now. That was quite true, and you might say the same of the Highlander's kilts, because they only wore the khaki cover in front, and when we retired a company or moved it to a flank they had the whole of the dark kilt showing behind; nothing would induce the Highlander to put the khaki cover over the whole of his kilt. The same thing of course happened with the great coat, but that is altered now because the great coat is the same colour as the men's clothing and the blanket, I suppose, too.

17921. Do you wish to make any other criticisms of the equipment?—I do not think so. I think that has all been dealt with, so far as I can see, by the issues they are making now, except that the puttie is quite the most useful thing that could be given to an infantry soldier.

17922. Have you anything to say as regards horses?—I had very little experience of horses in the early stages of the war as remounts, except the horses that the Yeomanry brought out with them, and they were excellent. A great many of them were their personal property, and nothing could have been better than the stamp of Yeomanry horse that I had to deal with. There was a certain amount of wear and tear, and we exchanged captured cattle with the Basutos, through the Resident at Maseru, and in that way we got the very best stamp of Colonial pony for mounted infantry work to be got in the country—that is to say, the Basuto pony. We practically depleted Basutoland of its ponies, and we gave the Basutos instead the cattle that we captured. I think it ran three oxen for one pony, and we never had any difficulty in keeping the division fully mounted.

17923. And you had plenty of transport afterwards?—Any amount, more than we were entitled to.

17924. As to the medical services, would you say they were adequate?—Owing to the exigencies of the service, I was short of a field hospital; they took it away for some other division, and, generally speaking, I think the medical service was overworked, undermanned, and under-ordered.

17925. The only other question that you raise in your *précis* is about the effectiveness of the guns, rifles, and other armament used; did you find them effective?—No, I did not, not from any fault of the gun, but because there was never any target. When the Boers gave a target I think the guns were most effective, but, of course, the Boers very seldom did. I think that was the reason of the want of effectiveness of the guns. They were wonderful in their life; the number of rounds that they fired was appalling before they showed any signs of giving out. The fuses at first were not as effective as they might be, but that was remedied by the Director-General of Ordnance, and the fuses eventually became very good; the effectiveness as regards artillery fire was never very great, but it was for that reason that the Boers never presented a target.

17926. (Sir Frederick Darley.) Previous to the war, were our regimental officers trained in entrenching?—Yes, all these things exist. We have any number of text books, and any amount of instruction in entrenching, but, as I said before, take, for instance, Dover, where I am quartered now. A man is taken out and taught to entrench on the Downs of Dover. It is a

totally different thing from teaching him to entrench in a hilly country like the Transvaal, and, until the country is varied, which means getting different sorts of manoeuvring grounds in England to entrench on, instruction will not be given in entrenching which will meet every case that is to be found on active service. That is what I mean by saying that the spirit of entrenching must be fully enforced, and people must be taught theoretically that they will have all sorts of different natures of ground, and it must be done on the spot, when they get there. No amount of entrenching on Dover Downs will teach people to entrench on the kopjes of South Africa.

17927. (Sir John Edge.) Had you to use the guns to cover the infantry in attack, in the operations that you have been speaking of?—Yes, always.

17928. And there, I suppose, they were of very great use?—Yes, of very great use, and the moral effect was very great. My contention is that a great deal too much is expected of artillery fire, and I think anyone who has had much experience of it would say the same of infantry fire. We are so accustomed to see experiments at Shoeburyness and Okehampton, and various places on targets and dummies, where they get a number of hits, that we expect to see the same thing in war, which I do not think will ever be the case; but, as regards the moral effect in support of infantry, I do not think the value of the guns by keeping them in action up to the last moment of the infantry attack can be over-rated. And they have also this effect, that they prevent the opposite side from putting their heads up and firing on the opposing infantry, which is half the battle.

17929. You found that they had that effect, I suppose?—Yes, absolutely—that men will not put their heads up and fire at you if they are under a heavy artillery fire.

17930. (Sir John Hopkins.) Were you satisfied with the range of your field guns, as compared with that of the Boers?—No, I do not think I was, but, then, the Boers, you see, more or less had a prepared position, and, therefore, they could lower the trail, and go through all sorts of tricks for getting the extreme range out of their guns, which did not give them very accurate shooting. Their shooting was never wonderful for its accuracy; it was wonderful for its range, but not for its accuracy. I came under Boer artillery fire, but it really had very little effect.

17931. But that is practically what we have heard, that, though their range was very extensive, they had very few hits?—Yes; therefore, I doubt very much whether our shooting can be compared with theirs, because we did not, of course, fire at extreme ranges.

17932. Would you be satisfied if you were entering upon a campaign with the range of our field guns as they are at present?—No, I would not, because my tendency is to go for a much heavier gun. I think we go for too light a gun. I do not think horses galloping about is necessary in modern warfare, and I think that horse artillery is almost a thing of the past. I want to see heavy field artillery brought in and dragged up by mules, traction engines, or anything that would do it; that would be my tendency.

17933. Have you any improvements to suggest in the Field Artillery, so far as equipment goes?—No, it is excellent. The whole of our harness and woodwork and splinter bars cannot be beaten; in fact, it is almost too good, everything, as far as I can see in the Field Artillery, is put together on the principle that it is to be thrown down a precipice one day, and left in a river for a week, and then come out and be just as workable. I think we might go in for much more lightness and less durability than we do.

17934. And get a lighter mount?—Yes, and lighter harness, too; all our harness is wonderfully good, and lasts; an elephant might be put into it almost.

17935. (Sir John Edge.) I do not know anything about these things, but if you were pressing a rearguard with your cavalry, would not horse artillery be of great use very often?—Yes. Perhaps I was putting it in rather an extreme way, but what I really wanted to emphasise was that I want to go for a heavier gun and a less mobile gun as regards trotting and galloping, which I do not believe in. I believe we can get the gun into action as the Boers did, with mules or oxen, which will conform quite well to the advance of our infantry, which is, and must be, very slow, and that we do not want all this trotting and galloping about.

Major-General Sir
H. M. L.
Rundle,
K. C. B.,
K. C. M. G.
D. S. O.

11 Mar. 1903.

Major-General Sir
H. M. L.
Rundle,
K.C.B.,
K.C.M.G.,
D.S.O.

11 Mar. 1903.

17936. What I was really driving at was this: that occasionally in warfare you want horse artillery to accompany the cavalry?—Yes; that is a rôle, of course, for which we must have a few light guns, but even then I do not see why field artillery should not do.

17937. Would they get along fast enough?—Cavalry, in a campaign, do not go so very fast, according to my experience.

17938. (*Lord Strathcona and Mount Royal*.) I gather, from what you have said of the antipathy or disinclination of both officers and men to forming entrenchments, that you do not think the advantages of entrenching and of selecting cover were profited by, generally, as they might have been?—No, not at first; but, of course, we gained by experience. The observations which I have made were on what was very marked at the beginning of the war. At the end of the war that passed away. I am sorry to say, at the end of the war even some had not learnt, but the majority had learnt by experience their value, and wherever they had learnt it it had a most marked result.

17939. (*Chairman*.) Is there any other point you would like to deal with?—I attach the greatest importance to the training of troops being in not too large bodies, and I believe that if we trained our companies and our squadrons and our batteries, and devoted time and money to it, we should get a better value than by manœuvring in large bodies, where instruction to the smaller units is practically nil.

17940. (*Sir George Taubman-Goldie*.) Would you approve of double companies rather than the present system?—If the double company officers are mounted, yes.

17941. If you mounted the double company officers you would approve of that rather than the present

system of single companies?—Yes, I am all for double companies, if the double company officers are mounted and the battalion commanding officer is treated as commanding so many units under him.

17942. (*Chairman*.) But you do not mean, by what you have just said, that you do not approve of manœuvres, do you?—No, I do not mean that. I like manœuvres, but I want the manœuvres to be for the training of the company officers more and the squadron officers more, not large masses of troops. I would like to see more time devoted to the training of the company officer if we are going to get the company officer the individual that we want to make him.

17943. But are the two things compatible? That you can have additional training of the company officers and yet for the management of a large body of troops have manœuvres on the large scale that they require?—I think the two things ought to be distinct. The manœuvres ought to be for training the troops, and the generals and the staff should be trained by staff rides without any troops. At present these large bodies of troops are trained, and the training largely goes to the generals and their staffs. The troops themselves go through an enormous amount of work of a most uninteresting nature, and the company commander gains nothing. I believe the generals and the staff could be trained equally well by means of staff rides, without any troops, and then the manœuvres could be devoted to the training of small bodies of troops, and not the generals and the staff.

17944. (*Sir John Edge*.) But if you had not manœuvres of large bodies of troops, how would you ascertain whether a general who had never commanded in the field was fit to command?—I do not think it can be ascertained till he is put into the field, and then I think it would be a toss up.

FORTY-FIFTH DAY.

Thursday, 12th March 1903.

PRESENT :

The Right Hon. The Earl of ELGIN AND KINCARDINE, K.G., G.C.S.I., G.C.I.E. (*Chairman*).

The Right Hon. The Viscount ESHER, K.C.B., K.C.V.O.

The Right Hon. The Lord STRATHCONA AND MOUNT-ROYAL, G.C.M.G.

The Right Hon. Sir GEORGE DASHWOOD TAUBMAN-GOLDIE, K.C.M.G.

The Hon. Sir FREDERICK MATTHEW DARLEY, G.C.M.G.
Admiral Sir JOHN OMMANNEY HOPKINS, G.C.B.

Sir JOHN EDGE.

Sir JOHN JACKSON.

BERNARD H. HOLLAND, Esq., *Secretary*.

Major-General H. C. O. PLUMER, C.B., called and Examined.

17945. (*Chairman*.) When did you go out to South Africa?—In July, 1899.

17946. And with what object were you sent out?—I was sent out to raise one of two mounted infantry regiments which were under the command of Major-General, then Colonel, Baden-Powell, whose instructions were, in the event of hostilities with the South African Republic, to operate on the northern and north-western borders of the Transvaal. The instructions that I had were dated the 10th of July from the Adjutant-General: "You will proceed by mail steamer of the 15th to Cape Town, where you will report yourself to the Governor and to the General Officer commanding, showing this letter of instructions to both."

17947. The purport of the instructions was that you were to go and raise these two regiments?—One of the two; Colonel Hore was to command one and I the other, and we were both under Colonel Baden-Powell.

17948. You have been good enough to prepare a short statement of your operations?—Yes, I have; I have prepared it from my reports which I sent in week by week at the time.

17949. We shall be glad to hear it?—In the first paragraph I have given the instructions that I have mentioned. Recruiting began at Buluwayo on 10th August, and by the end of September we had nearly reached our

establishment (450), and started to march to Tuli, about 80 miles south of Buluwayo, and about 20 miles north of the Limpopo River—the northern boundary of the Transvaal. General Baden-Powell at the end of September proceeded to Mafeking, where the other mounted infantry regiment, under Lieutenant-Colonel Hore, was being raised. He left me in command of the force in Rhodesia. I have here a copy of his instructions. Shall I read them now?

17950. If you please?—The instructions I received from General Baden-Powell on my arrival at Tuli at 8 p.m. on 10th October, 1899, were:—(1) To defend the border as far as it can be carried out from the neighbourhood of Tuli, as a centre. (2) By display of strength to induce the Boers to detail a strong force to protect their northern district. (3) To create diversion in the north of the Transvaal, co-operating with the invasion of the south by our main force, if necessary advancing into the Transvaal for the purpose. No portion of your force is to cross the frontier till you receive orders. Instructions will be sent to you as to the date for co-operation with the other column." As a matter of fact we were immediately cut off from all communication, and no other instructions were possible. The Rhodesian regiment—as my mounted infantry regiment was called—reached Tuli on 11th October. There were there about 100 men of the British South African

Plumer, C.B.
12 Mar. 1903.

Police, and a Maxim Nordenfeldt 12½-pounder gun, two 2·5 inch screw guns R.M.L., and two 450 Maxim guns on naval carriages. The total number of men was about 550. From the point of junction of the Transvaal, Portuguese, and Rhodesia boundaries on the east to Mafeking is about 500 miles, and the River Limpopo, which forms the boundary, is passable almost anywhere excepting for short periods when in flood; but the extreme eastern portion of the border was never threatened, and the western portion defence was undertaken by additional troops from Buluwayo—as will be explained—so that on the force at Tuli devolved the defence of about 200 miles of frontier. From the outbreak of war on the 11th October till the 26th November the Tuli force was constantly engaged on the Limpopo River with the Boers, who at one time had about 1,700 men there; but on the latter date they left the border, and retired back to Pietersburg and Pretoria, leaving only small parties to watch our movements. Owing to our small numbers, the difficult nature of the country, and the Limpopo River coming down in flood, we could not follow up the Boers much, though we made some incursions into the Transvaal, and it was not till about the end of December that we could ascertain that the Boers had retired south of Pietersburg. Meantime strong parties of Boers early in November had been seen on the western border of the Transvaal, apparently threatening Khama's country. To meet this Colonel Nicholson, the Commandant-General of the British South African Police, had collected and despatched to Palapye and Mochudi, about 350 men of the British South African Police and Rhodesian Volunteers. Palapye and Mochudi are on the railway from Buluwayo to Mafeking, distant from Buluwayo about 200 and 380 miles respectively. Mafeking had been cut off since the beginning of the war, and was closely besieged. As soon as it was certain that the Boers had retired from the northern border I left 100 men at Tuli, and marched with the remainder to Palapye (175 miles), and moved thence by rail to Mochudi, where I joined the force there, and moved southward with a view of endeavouring to relieve Mafeking. Gaberones, about 100 miles from Mafeking, was reached on the 14th January, the railway north of that point having been but little damaged. About 10 miles south of that place, however, the Boers had taken up a strong position astride the railway at a place called Crocodile Pools, and had blown up an important iron bridge which took us a long time to repair. We were constantly engaged with them, but it was not till the 25th February that they evacuated their position and retired southward. During January and February the strength of my force fluctuated, but I find that on 17th February I had, all told, 998 officers and men, and 502 horses. These numbers included sick and wounded, men along the line of communication, and on the armoured trains. These three armoured trains which had been improvised and despatched from Buluwayo were of the greatest possible assistance. When the Boers retired southward we followed, repairing the railway as we went, and on 6th March we reached Lobatsi, a station about 60 miles from Mafeking. During February we had been receiving despatches from Mafeking pretty regularly, and knew that the garrison were holding their own well. I had, however, realised that it was unlikely with my small force I should be able to advance much further along the railway line, and had despatched during February convoys of wagons with supplies to Kanya, the capital of the Chief Bathoen's country, about 30 miles west of Lobatsi and 70 miles north-west of Mafeking, and early in March had a small depot there. As was to be expected, the Boers when they found we had established ourselves at Lobatsi moved northwards from Mafeking with a view of cutting us off from our base at Buluwayo. They were getting round us on 16th March, and that night I sent the dismounted men under Colonel Houldsworth, 7th Hussars, to Crocodile Pools, and marched with the mounted troops to Kanya. On 17th March I had at Kanya 550 men with two 2·5 inch guns and one Maxim. Colonel Houldsworth, to defend the railway, had one 12½ pounder gun, one 7 pounder; one Maxim, and 350 men. On 21st March I reached, with the mounted troops, a place called Sefetili, about 30 miles north-west of Mafeking. From there I despatched a message to General Baden-Powell, saying that if he was in need of assistance I could advance at once, but that I could not bring in supplies. I had 11 days for my own force only, and with the railway only available as far as Gaberones, supplies from there had to be brought 60 miles by wagons, of which there were very few. On 28th March I received an answer from him stating that the circumstances of the Mafeking garrison were not

then critical, and not such as to justify an immediate attack by our small force. On 26th March (two days before that) we made an incursion into the Transvaal to within 12 miles of Zeerust, in the hope of drawing off in that direction some of the Boers besieging Mafeking, and on 31st March reconnoitred to within about six miles of Mafeking, but were attacked by a considerable force of Boers, and had to fall back to Sefetili. During April we had to remain stationary. The Boers round Mafeking, who numbered at the beginning of April about 2,000, were reinforced during the early part of that month, and by the 15th had increased to about 3,000. I had received a few recruits and convalescents, but had to send a great many men away owing to fever, and could never muster more than 500 men. I was in constant communication with General Baden-Powell, and he deprecated our attempting, until reinforced, doing anything except endeavour to pass in food. This we attempted to do in the shape of cattle, but without much success, very few getting in. On the 4th April Lieutenant Smitheman succeeded in getting through the Boer lines into Mafeking, and returned on 8th April. By his influence he induced the natives in Mafeking to endeavour to break out in small parties, and they did so so successfully that over 1,200 reached us between that date and the relief on 17th May. This was an enormous saving of food for the Mafeking garrison. During the month we had frequent rumours from natives of the approach of a British column from the south, and had runners constantly out on the watch for it. General Carrington was sending from Salisbury via Buluwayo to help us a Canadian battery and about 200 Queenslanders (without horses). These reached Buluwayo on 6th May. On 1st May 100 men of the British South African Police reached me from Mashonaland, and brought another 2·5 inch gun. On 12th May a telegram was received from Lord Roberts to the effect that a column from the south had left on 4th May, and might be expected near Mafeking about 15th May. Runners were sent out to communicate with this column, and on 13th May a message was received from Colonel Mahon saying he expected to be on the Molopo River on 15th May. He had about 900 men and six guns. On 14th May the Queenslanders and Canadian Battery (four guns) arrived from Buluwayo. I had withdrawn the 12½ pr. gun from the railway, so had altogether eight guns and about 800 men, of whom about 450 were mounted. All the guns were drawn or carried by mules. We marched that day and joined Colonel Mahon on the Molopo River on 15th. The two columns had a successful engagement with the Boers on 16th, and entered Mafeking at daylight on 17th May. On the 18th May I took my column back along the railway line to Pitsami to repair the railway. This was completed on 24th May, on which day a train with supplies was brought in to Mafeking. On 25th May we moved westward into the Transvaal, and occupied Zeerust without opposition on 28th May. General Baden-Powell moved out of Mafeking about 5th June, and we occupied Rustenburg on the 10th June, which was five days after Lord Roberts actually occupied Pretoria. I understand that you do not wish anything after that date.

17951. That is the period comprised in our Reference. What class of men did you get at that time?—I had up to that time South African Colonials, and I was joined, as I said in my report, by this Canadian battery and a detachment of Queenslanders. Subsequently to that I had Colonials of all kinds.

17952. Under your command?—Yes.

17953. I was speaking of this regiment that you raised?—They were mostly Rhodesians; they were recruited in Buluwayo. We could not get all the men we wanted in Buluwayo and Rhodesia, and we brought them up before the war from different parts of South Africa, Cape Colony, and the Eastern Provinces, Kimberley, and Cape Town.

17954. So that if I caught the number correctly you began with a strength of about 450?—Yes, that was what I authorised to raise and pay.

17955. Then in February you had 980?—Yes, we were reinforced from Buluwayo by Rhodesian Volunteers and British South African Police.

17956. They were separate forces?—Yes, they were under my command inasmuch as I was in command of the whole forces in Rhodesia, but they had different terms of payment.

17957. Were the men that you raised yourself in this regiment a good class of men?—Yes, very good; they were much better, of course, after the two months'

training. That is why I consider we could do what we did, because we began training on the 10th August, and war did not break out until the 11th October, which gave us two months to train the men before we had any hostilities at all.

17958. What were the terms on which they were enlisted?—They were enlisted for three months, or for such time as the Government might require their services—as long as the war lasted—at the pay of 5s. a day.

17959. And the officers?—I had seven Imperial officers with me, a medical officer, and a veterinary officer—nine altogether.

17960. Whom you brought out?—Whom I brought out from England.

17961. And as to non-commissioned officers?—The non-commissioned officers we had to make from amongst the troops, except one sergeant-major I had whom General Baden-Powell brought out of his own regiment, the 5th Dragoon Guards.

17962. And looking at your experience in raising a regiment of that kind, is that the sort of arrangement that you think suitable?—I had had experience in 1896 too, and I am very strongly of opinion that to get the full benefit out of Colonial troops Imperial officers have to be put with them.

17963. Commissioned officers?—Yes.

17964. And non-commissioned officers, too?—If possible, but I do not think that is so important as the officers. I should have been very glad to have had some non-commissioned officers, but they are not nearly so important as the officers.

17965. But Imperial commissioned officers you think are essential?—They are of the very greatest importance, there is no question, with all classes of Colonials.

17966. Have you been asked to draw up any memorandum with regard to the raising of a force of this kind?—No. The telegram that General Baden-Powell sent to me was: "The corps will be equipped on the same lines as your regiment in 1896." Those, of course, I had with me—conditions of service for the regiments I raised in Matabeleland in 1896, and I worked on the same lines.

17967. I meant have you been asked since to put your views on paper?—No.

17968. Have you any suggestions with regard to the matter which you would like to lay before the Commission?—I think the most important point is to have Imperial officers, as I have already told you. I think also the Commanding Officer ought to be allowed a free hand in the way of dismissal. That was a point on which I insisted at both times—that there should be a contract entered into in which the man should agree that if he was found by the Commanding Officer to be of no use without his having committed any offence, the Commanding Officer should have the power of dismissing him. That I found was the best instrument to have in the hands of the Commanding Officer.

17969. That is more effective than any form of punishment?—Yes, it is the best power that can be given to Commanding Officers.

17970. Had you to exercise a power of that kind?—Yes, at the beginning we did—quite freely.

17971. While they were recruits?—Yes, not after war broke out. Then I wanted every man, and I hesitated to throw away even an inferior man; but at the beginning certainly I exercised it freely.

17972. But I understood from another witness that even in the field the power was a great advantage?—Yes, and, of course, if one was in a position where one could get reinforcements easily, one would exercise it then certainly.

17973. But, as a matter of fact, you did not have occasion to exercise it much then?—Not after that for that very reason—that I was very short of men; and by that time, of course, we had got men who were pretty reliable.

17974. Those are the main suggestions you have to make on that point?—Those are the main suggestions, I think, on broad lines. Of course, if the question of pay and so on is gone into, we have to see what the situation at the particular moment is to attract the recruit.

17975. Although our Reference is limited as regards military operations to the date of the occupation of

Pretoria, any experience that you had during the whole of the war we shall be glad to have the benefit of?—Quite so. I have based the remarks I have made in my précis on my whole experience.

17976. You said just now that you had yourself other Colonials under you. Have you any remarks to make with regard to them?—General remarks, do you mean, or on what particular point—about the class of men?

17977. Yes?—The over-sea Colonials were a very fine class of men, and especially the earlier contingents.

17978. What Colonials had you under you?—I have referred to the Canadians, and I had Queenslanders, New South Wales, Victorians, West Australians, and New Zealanders.

17979. And generally they were a good class of men?—Generally they were a very fine class of men indeed.

17980. (Sir Frederick Darley.) Did those men land at Beira?—I had some that landed at Beira.

17981. New South Wales men?—Yes, the New South Wales men came in that contingent. The New South Wales men, then the West Australians, a small contingent of Victorians, and some of the Queenslanders came, and then I had afterwards other contingents from the same Colonies, but different contingents.

17982. (Chairman.) You have mentioned as the chief point the need of Imperial officers. Was there any difficulty with regard to that in the over-sea Colonial corps?—We did not have Imperial officers as such, of course, with any of these contingents, but there were among the officers a certain number who had had previous training in the Regular Army—officers who had gone out to Australia. I can mention a major who left the West Yorkshire Regiment and had gone out to Australia afterwards, and came out with a contingent. His contingent was one of the very best. Colonel Craddock, who commanded the New Zealand contingent, had previously served as a subaltern in the Carabineers. His contingent was excellent. I might mention another contingent of New Zealanders commanded by Major Andrews, who is now serving in the Hyderabad contingent in India, and was in Australia on leave: his contingent was good. I always found when officers had had previous experience the results were better, with the exception of a very few of the Colonial officers. But, as a rule, where the Colonial officer failed was that he was very good up to a certain point, up to the command of about 200 men, but there were very few indeed in my experience whom we would care to send out with a force much larger than that on their own responsibility—independently. They were quite capable of carrying out orders with a force of about 200 men, many of them, but very few indeed beyond that point.

17983. You mean men who had not been in the Regular Service?—Yes, men who had not been in the Regular Service.

17984. (Lord Strathcona and Mount Royal.) Had you amongst the Canadians any who had been officers of the North-West Mounted Police?—No, I do not think so. I had only one battery of the Canadian Artillery.

17985. They were not men from the North-West?—No, I did not have any Canadian infantry or mounted troops, only one battery of artillery.

17986. (Sir Frederick Darley.) Do you remember who commanded the New South Wales contingent that landed at Beira?—Colonel Airy.

17987. He had served with the Regular Forces?—He had been with the Regular Forces, and I think out there he was an artilleryman; that was a curious thing, because he was commanding the Mounted Rifles.

17988. He had served with the British Forces in Burmah?—Yes, he had.

17989. And he got the Distinguished Service Order there?—Yes.

17990. (Chairman.) You have gone over the different points in your précis. First of all, what have you to say about the shooting?—I think the shooting was very disappointing.

17991. The shooting of all the forces?—Of all. I had very few Regular infantry, of course—in fact, practically none—or cavalry. I think the shooting of the Colonials was very disappointing. I thought the over-sea Colonials would have been much better shots than they were; there were some exceptions, of course, fine individual shots, but on the whole they were very disappointing.

17992. (*Sir John Edge.*) Including the shooting of the guns?—The Canadian Battery after they had been three months in the field were very fair, but that was the only one battery I had—that Canadian Battery.

17993. (*Chairman.*) The shooting of the men did not compare with that of the Boers?—The Boers were the best.

17994. Do you mean collectively or individually?—Individually certainly, and I should think collectively too.

17995. (*Sir John Edge.*) What class of Boer did you have against you?—I think I had every class. I had every portion of the Transvaal; I had most of the Orange River Colony commanders—De Wet, and so on.

17996. Did you find the shooting of the later levies of the Boers was as good as the shooting of the earlier levies?—No, I do not think it was; and, of course, ours improved.

17997. Then which levy are you comparing the shooting of with the British?—I think generally. Generally, I think the Boers' shooting was better than that of the troops I had.

17998. Including both levies; including the earlier levies and the later levies?—When you talk about levies, at the end of the war there were men in the Boer forces who had been fighting right throughout from the start; in fact, it was almost at the end the survival of the fittest among the Boers; some of the best men were still left fighting. In the action we had on the 4th January, 1902, the Boers fought very well, and charged right home to us. They had then some of their very best men under Christopher Botha, and those were certainly as fine fighting men as any I met with at the earlier part of the war. That was about the hottest fight we had so far as man to man was concerned, in the whole war.

17999. (*Chairman.*) But our men improved?—Yes, of course they did with practice.

18000. And eventually they became equal to the enemy?—I should have said that at the end of the war the Boer, man for man, was the better shot.

18001. Except the British South African Police?—Yes, I should say perhaps they were better, because they had had a lot of previous training; some of them had had a year and more training in the police, and had had a good deal of shooting, and they were certainly better. I do not think they were exceptionally good, but I think they were better.

18002. Were they a good force?—A very fine force. They were thoroughly well trained, and were good in many ways which others failed in, such as horsemanship; their horses were well looked after.

18003. The horsemanship as a rule was not good?—The horsemanship, I consider, was not at all good, and the over-sea Colonials were disappointing in that way. As I have said in my précis, both horsemanship and horsemastership improved very much during the campaign. The horsemastership did, of course. There again was where the Regular officer came in; those contingents which had Regular officers were certainly much better in that way than those which had not.

18004. It was to some extent a matter of discipline?—Certainly.

18005. What do you say about physique?—The general physique of the South African Colonials that I had was very fair, and that of the over-sea Colonials very good. That would be natural, perhaps—they were all picked men. The morale and intelligence of both were good. The intelligence of all developed very rapidly during the campaign, and their fighting efficiency increased proportionately, and the way they worked was very satisfactory. I think at the end, so far as that kind of work with intelligence was concerned, we were quite equal to anything we had to meet.

18006. Man for man?—Man for man, so far as intelligence, looking after himself, and finding his way about the country, and scouting, and so on. After a year they were as good as anything we could want.

18007. So that the fighting value increased?—I estimate the fighting value of the units I had after 12 months in the field, as compared with when they started, at the ratio of five to two. I would rather have had 200 of them as they were after a year's service than 500 of them as they were when they started, if I had the choice.

18008. You could have done more with the 200 than

with the 500?—I consider that if Lord Kitchener had offered me at the end of the war 200 of the men I had had under me for a year, or 500 men imperfectly trained, I would have taken the 200.

18009. Do you throw that out as a general observation applicable to the Army?—I do not know. I would rather speak of what I had actually in my own experience. I had always mounted troops, and there are certain things more important with them than with dismounted men, such as scouting, and that sort of thing, and the capabilities of the men to look after themselves, and find their way about, and not get into a mess when left alone. That was the enormous difference after about six or seven months in the field.

18010. You consider that the experience of the war has shown that the principal object to have in view in the training of the soldier is the development of individual intelligence?—Yes, training the individual man. As regards entrenching, it was very difficult to get them at first to do it. They did not think it was much use, and they rather resented the kind of work, especially the South African contingents, as they had been accustomed to employ Kaffirs always, but after they had once had a few actions and they found out what an immense advantage it was, they were very good at it, they were very intelligent, and in fact it did not require at the end of the war to tell them to entrench themselves; they always did it as a matter of course. We took up a position, and expected after an hour or so to find our men entrenched, and, with very rare exceptions, it was so; but at the beginning of the war we had to explain to them how very important it was and what a difference it would make.

18011. That would depend upon the officers too?—A great deal.

18012. And as to the training of the soldier what do you say?—I think it is of great importance to begin at the beginning of his military service to make the individual man independent and self-reliant, capable of finding his way about and of looking after himself in every way, such as cooking in the field (it is most important to be able to make the best value of what little food he has and make the most of it), sufficiently expert as a shot to be able to hold his own, man for man, with any opponent, and sufficiently intelligent to be able when left to himself to carry out the orders of his superiors. I think myself we have been accustomed rather to what I call dry-nurse the soldier from the start; he is accustomed always to look to his non-commissioned officers and to his officers for everything. That is where he differed from all the Colonials. They were accustomed to look after themselves and shift for themselves, and they made the best of what the circumstances provided for them in the way of food and everything else. The difference was most marked. We had very long marches and very hurried marches, mounted troops covering long distances, and all we could give them was just the cattle we picked up. The man trained to look after himself had his meals cooked in a very short time, and another man coming out fresh, a townsman, did not know what to do with the sheep or ox when it was given to him, and by the time he found out what to do with it probably the short time left for his food was almost over; consequently he had to go hungry, and thereby he decreased his own efficiency; he was not able to keep as fit as he ought to be. I think it is most important that a man should be able to look after himself. The same thing applies to scouting, finding his way about the country by landmarks, and by the sun, and so on, which the Colonial does naturally in his own natural life, and so was very superior to the townsman who came out and had no idea of finding his way about.

18013. It is rather difficult to teach them that in this country, is it not?—Extremely. We are trying to begin it, and I think it would be better to do it from the time when a man joins. Some men, who have led country lives, are much more easy to teach than men brought up in towns.

18014. You say that there are difficulties in the way of commanding officers at home in the training of their men by having to furnish the large number of "employed" men that they are called upon to do?—Very great difficulty; that is a thing that is rather outside the scope of the Commission perhaps, but I think we are much hampered in the training of our men by having to furnish the large number of "employed" men that we are called upon to do. The consequence is

that, as I have seen at Aldershot now, we have really very few men actually available for the work of the soldier.

18015. You mean on account of so many men being detailed for fatigue duties?—For fatigue duties. A large number of men in all garrisons are employed as clerks and orderlies, and on many duties of that kind.

18016. Who are on the strength of the company?—Who are on the strength of the company. We just manage to relieve them for their training periodically, but they do not get a systematic and regular course. After they have done their month or so they go back to their duties.

18017. We have had a good deal of evidence about it; but are you of opinion that it is a very serious matter?—Yes, I am sure it is.

18018. (*Sir Frederick Darley.*) Particularly with the short service men?—Yes, we have a very short time to train a man. We pick him up in the streets of a town, and try to teach him to be of use in a campaign like that in South Africa, and you can imagine it takes a very considerable time.

18019. (*Sir John Jackson.*) Your remarks refer mainly to a campaign like that in South Africa?—Yes, naturally I am thinking of the experience one has just been through. I found it so very marked. I can assure you that it makes all the difference to a commander if he knows that he has a couple of hundred men whom he can depend upon, and that he can send out a body of 50 men on their own account, and not to be anxious about them until they come back. To be able to send out 50 men, and know that if they get into a difficulty they will get out of it, and get back all right, and that they will not lose their way or starve themselves because they do not know what to do, makes all the difference.

18020. (*Chairman.*) As regards regimental officers, what have you to say?—The great thing is to encourage the junior officers from the beginning in some way to act more on their own responsibility instead of as at present, subaltern looking to Captain, Captain to Colonel, and Colonel to General. I do not think I should give them financial responsibility. I think that weighs them down more than anything. If a young officer knows that if anything happens to his accounts he may have to pay £5, £10, or £20, he naturally thinks more of that than he does of failing to carry out his training, when he only gets a reprimand from his Colonel perhaps. Therefore I would try to relieve officers, especially junior officers, of financial responsibility, because I think in the natural order of things it must be the one thing they devote most attention to.

18021. Do you mean by having regimental paymasters?—Yes, I do; something of that kind. I would relieve the company officer of accounts as much as possible.

18022. They have been simplified?—Yes, they have been simplified, and they have a system, I think at Dover, in which they will hand over the company accounts to the paymaster.

18023. But you would wish them to be relieved altogether; you do not think that any simplification of the accounts by itself would be enough?—That is a step in the right direction; but I think the real thing is to relieve them of financial responsibility altogether if possible. Many officers are poor men, and it is a frightful thing to them to have to pay up £20 or £30.

18024. And as to staff officers, what have you to say? I think a greater number should be allowed to go through the Staff College. Perhaps I am rather prejudiced, because I am a Staff College officer myself; but wherever I came across Staff College officers, I found the work was done in a far more systematic and satisfactory way than where it was done by officers who had not had that training. I think we had to put officers into staff appointments who had had no experience, and the very fact of their not having had any experience and not knowing the A B C of things rather hampered them; it exercised them so dreadfully in having to learn the routine work, that it took up all their time, whereas an officer who had had training and knew the A B C of the work would be at once at home, and he could devote a great deal more of his time to more important matters, such as advising his General in the operations in the field.

18025. What do you mean when you state in

your précis that a certain number of selected staff officers should be relieved from peace routine duties?—I think that in peace time, somewhat on the line of the German staff, we should have certain officers who have nothing to do with the peace routine. I think that they should be attached to divisions or districts, as the case might be, and that they should supervise the training to a certain extent, and be the confidential advisers to the General on all matters connected with tactical problems and manoeuvres, and that they should assist in training the other officers to teach, because most of the junior regimental officers with the best will in the world do not know how to set about teaching, and if they were able to have the benefit of the advice of men who had nothing else to do, whose time would not be taken up in doing the ordinary peace routine of discipline, and so on, I think it would be a great benefit.

18026. Would those officers not revert in any way to regimental duties?—Yes, they should take their turn; but I think my experience as a staff officer, and for a short time as a general officer, is that the ordinary staff officer has no time to devote to this, because he has a full day's work in carrying out the ordinary routine work of his peace command. At Aldershot and at most places a staff officer is fully occupied in the ordinary peace routine which he cannot neglect.

18027. But you do not mean by that the separation of a class of staff officers who would definitely abandon regimental duties?—No, I think it is an excellent thing that an officer should be kept in touch with his regimental duties. I mean only that out of that staff there should be one officer who never had peace routine duties, but who should be the confidential adviser of the General, and should have the General's problems given to him to work out, and also that he should supervise the tactical work of the regimental officers, and so on.

18028. Then the next subject you deal with is supplies?—I should like to put on record the fact of the remarkable way in which my force, and the whole of Rhodesia, was kept supplied when we were actually cut off. That was really due to Colonel Nicholson, Commandant-General of the British South African Police, who, previous to the outbreak of hostilities, had collected supplies in Buluwayo sufficient to last the whole of the white population of Rhodesia for eight months. That was the situation there, and he saved the situation in the north; and in January, 1900, three months after the war began, he arranged for further supplies to be sent from Port Elizabeth to Beira, so that we were not only able to feed ourselves, but when we relieved Mafeking we were able to throw supplies into that town.

18029. Those supplies were collected before the outbreak of the war?—Yes, in October he had them there. I saw his storehouses; he did not buy all himself, of course, but he had gone round and encouraged the merchants, pointing out to them what might happen, and what good business it was for them to do it; and there were actually in Buluwayo sufficient supplies for eight months for the whole of the white population of Rhodesia, 7,800 men.

18030. And after the war began we could not have done that?—We could not have got it from the south; we could have got it by railway from Beira to Salisbury, from Salisbury to Buluwayo, 250 miles by wagon, and then down by railway again; that was done, but it took a long time.

18031. At any rate, it would have been very difficult to have got the same amount of supplies up after the war began?—We should have been on very short commons indeed.

18032. That is an instance of the advantage of adequate preparation beforehand?—A very great instance.

18033. Was the quality of supplies good?—The quality of supplies was good. No failure on the part of contractors came to my notice.

18034. Have you anything to say as regards horses?—Prior to the outbreak of hostilities horses were purchased for my force at an average price of £19 10s. from different parts of South Africa (about 500) and up till the occupation of Pretoria these could only be supplemented by the few obtainable in Rhodesia, and they were very few. These horses stood the strain of the campaign remarkably well, and nearly 30 per cent. were effective at the end of twelve months' service in the

field. They compared wonderfully with anything that we could get afterwards, and I think a great deal of that was due again to the two months that we had previous to the war, when we had slow and steady work to get them fit. We got them really fit in those two months; after that they were wonderful, and they stood the work in a wonderful way. I myself rode a horse for which I only paid £19 10s., and I rode it throughout the whole campaign; I hardly had another horse.

18035. Was that a South African horse?—Yes, that was a South African horse, and he was perfectly fit at the end. The last trek I did was 60 miles.

18036. I suppose the South African horses had an advantage?—I think so. I think they were a long way the best horses, when they could be got, for the work; they knew the country, and they were good horses. The little horse will do with less food than the big Australian horse; he starves on a ration that the South African pony thrives on. The British South African Police were very well mounted, and were very good horsemasters, and their horses were really a pattern of what a horse should be after twelve months' service in the field.

18037. (*Viscount Esher.*) What size horses?—About 14·2; some of them up to 15 hands; hardly any up to 15 hands, some smaller; between 14 and 15 hands we bought them as a rule. We tried to buy them about 14 to 15 hands, and preferred them 14 to 14·2.

18038. (*Sir John Jackson.*) In which district did you get the best horses?—The Orange Free State.

18039. What about the Basutos?—The Basutos are rather hard to get; I do not think they could be obtained for that price. They are very good ponies, but the Basutos did not like selling them. We had a remount officer in Basutoland, and he did get a certain number.

18040. Is the Basuto pony considered the best?—The Basuto pony is even a smaller pony than what we had. I do not think one could do better than with the Orange Free State ponies as they were then in the beginning of 1899. In 1896 I had to buy 1,100 of them, and they did extraordinarily well. I bought them for as little as £17 each.

18041. (*Lord Strathcona and Mount Royal.*) Looking at the enormous number of horses used up, you must have been much more fortunate than others?—In the earlier part yes, but in the latter part I was no better off than anybody else, and that I say is due to the fact that the horses were worked too soon after landing in the country. That was unavoidable. We had an enormous number of mounted troops employed, and an enormous number of columns, and unless Lord Kitchener had knocked off some of the columns altogether, which might have prolonged the war (at any rate, he thought so), the columns had to be kept going, and we were constantly kept moving, and the supply of horses was not equal to the demand.

18042. Still your men must have been very careful of their horses?—In the first part they were very good indeed.

18043. Had you greater facilities for grazing them generally throughout the country?—No.

18044. Yours was a peculiar service, as we are aware?—Yes, but I think in the two months we had got the men into a thoroughly good routine. We had had two months of peace when we were our own masters, during which the horses themselves were made very fit, and we were able to keep that up for the first year. Then my Rhodesian men were disbanded, and after that I had many different contingents, and the horsemaster-ship amongst the over-sea Colonials, I am sorry to say, was not at all good. My experience was that it rather acted in this way, that if the Australian got a bad horse, he did not care a bit about it, and was very careless in looking after it, and, therefore, it went from bad to worse, because if they once began getting bad horses, they took less trouble about them.

18045. Your men came to feel that horses were a necessity, that they could not be replaced always, and therefore must be carefully looked after?—Yes, that was in the early part of the war; every man knew the value of his horse then, and if a horse was ill we all went and looked at it, and considered it a very serious thing. In the latter part of the war, of course, no such consideration was possible.

18046. (*Chairman.*) You did a good deal of work on

the railway?—Yes, in the earlier part of the war a good deal of work was done on the railway, because we depended on the railway entirely for getting up our supplies on our advance to Mafeking.

18047. And also you had armoured trains?—Yes, and the armoured trains were excellent; they were improvised in Buluwayo by the railway employees there; and the little guns we had were very good, too. We had a Maxim and a 7-pounder gun, very ingeniously made, and they did extraordinarily good work in keeping open the railway. We always ran the armoured trains in pairs. We always had one in support, with the construction train close up behind, so that any damage to the railway was repaired at once by the second armoured train in support, and really we never had any difficulty.

18048. What were they used for, to bring up supplies?—To convoy the supplies, and also to prevent any damage being done to the railway. They used to halt for the night at different places, such as bridges, and any dangerous places. We used fuel entirely for the trains; there were only 75 tons of coal in Buluwayo, and we never touched that.

18049. You used wood?—Yes, entirely, hard wood. We had to cut the wood as we went along, and it did very well. And it was very useful in one way, there was very little smoke with it, and so the Boers did not see it very much.

18050. What was your experience of mules and oxen?—The mules we got in Rhodesia were excellent, and some of the mules that we bought went through the whole of the campaign. The quality both of the mules and oxen deteriorated as we went on, and the difficulty in feeding the transport animals caused very heavy losses.

18051. Were you fully equipped with transport at the beginning?—I had very little transport. I could not carry more than about eight or nine days' supplies on wagons.

18052. Were the wagons good?—The South African mule wagon is the best wagon, I think, of all for that country. We had two very good Canadian wagons which were excellent, and they lasted very well; they were rather heavier, but they were very solidly made, and they stood extraordinarily well. Otherwise, I think, the South African mule wagon is quite the best mule wagon for the country.

18053. And with regard to the medical services, what do you say?—With regard to the medical services I had only one medical officer of the Royal Army Medical Corps with me, but I engaged civil surgeons from Buluwayo. The civil hospital of Buluwayo was used as a base hospital, and a station hospital was established at Tuli and others afterwards at places on the railway. We had hardly any tents at all, but we managed to use buildings and so on, and native kraals in places. I think, considering everything, the medical arrangements were well carried out; they all worked well. The serious cases of wounded and so on, as long as we had the railway, we sent back to Buluwayo.

18054. Was there much sickness?—There was a good deal of fever in Bechuanaland, that was the country just north of Mafeking, and a great deal especially amongst some of the men who came from Mashonaland. I had as many as 70 per cent. of those down with fever at one time.

18055. And the absence of tents would affect that?—Yes, certainly.

18056. Did you manage to get them under cover?—I had to send those cases back to Buluwayo, and then after a week or a fortnight perhaps they recovered and came back again.

18057. As regards Engineer services you have something to say?—In connection with Engineer services I should like to record the excellent work done by the Engineer troop of the South Rhodesian Volunteers who came and repaired the railway. They were all railway employees, and it was owing to their work that the railway from Buluwayo, on which so much depended, was so rapidly repaired. I think in the latter stages of the war more use might have been made of the field telegraphs. When columns were working all over the country I do not think they had as many field telegraph and cable carts as they might have had.

18058. Did you have any field telegraphs?—Yes, I had one always with me. I managed to keep it all

Major-General

Major-General
H. C. O.
Plumer, C.B.

12 Mar. 1903.

along, and it was of the greatest possible assistance. I always kept it as long as I could.

18059. In the latter phases of the war I suppose the number of columns again affected that?—Yes, I do not think it was quite realised how much use might be made of it. It is rather a troublesome thing; it must not be wasted, and we have to arrange to send back to collect it; we cannot scatter it all over the veldt. But in the latter part of the war everything depended on intelligence and communication between columns. If we had intelligence and communication between columns we could do a great deal.

18060. You had some native pioneers, I think?—I had what I thought worked very well, that is to say, natives mounted on little ponies or donkeys, or anything they could pick up, with picks and shovels to go on right ahead behind the advance guard to prepare drifts and roads, and any bad parts of roads, so as to prevent any delay to the guns and wagons when they came up. They were very good indeed, and did very good work; they were very useful.

18061. Have you anything to say as regards guns?—The guns that I had up to the relief of Mafeking were of various and mostly old patterns, and were ineffective. We had altogether seven guns and 12 machine guns. Out of seven guns three only were efficient. There was one Maxim Nordenfeldt quickfiring gun, which was really one of the Jameson raid guns; the Boers took one at the Jameson raid, and they did not take the other. I had one and they had the other; and the situation at Crocodile Pools was that these two guns were fighting against each other for about a month.

18062. You had only three efficient guns?—That is all at first, and the two little 2·5 in. screw guns, mountain battery guns, were very small, and they had black powder, which was a terrible target for the enemy, and they could only shoot up to about 3,000 yards.

18063. (*Viscount Esher.*) Where were they got from?—They were two guns that came up from Natal in 1896. In 1896, when I was in the Matabele War, I recommended the Chartered Company to buy them from the Government, which they did, and those are the guns that I had three years later. They were very good guns for mountain work and that sort of thing, but they were no use at all against the longer range guns.

18064. (*Chairman.*) Had you any galloping guns?—Only the Maxims; I had three Maxims; they were on naval carriages.

18065. So that they could go with the mounted men?—Yes, they could go with the mounted men; they were rather slow, but they could go. Then later on we had another of these mountain battery guns from Mashonaland, but we had to carry it on a cart; it had no equipment. And then later on we got the Canadian battery guns, just before Mafeking; they were the ordinary field guns, but they had no horses, and we had to draw them with mules. Afterwards we had the service horse and field artillery guns.

18066. But you think the range was not good?—They were not useful for the kind of work we had to do then, because we very seldom got in much artillery work at the Boers at the latter part of the war under about 4,000 or 5,000 yards, and these guns were of little use over 3,500 yards, I think.

18067. You had some pom-poms?—I think pom-poms used singly are excellent with mounted troops; I think they are very valuable; I think they saved life. If they are sent with the advance guard of the force with mounted troops it very often happens that small bodies of the enemy are trying to delay them in taking up a position on a hill and so on, and if we have pom-poms as a rule they clear away without offering an resistance. If we have not any we have to make a turning movement probably or to attack a position, and, perhaps, lose three or four men in doing so, with no other result except that we get the position with the delay of an hour and the loss of four or five men, whereas with a pom-pom we get it without the loss of time and without the loss of a man.

18068. We have been told that the effect of the pom-pom shell is more a moral effect?—It is entirely so. I do not think they very often hit anything, but the moral effect was excellent.

18069. Would you say the same of the very long range of the Boers big guns?—I had no experience of the Boer big guns.

18070. Not in the subsequent stages of the war?—No.

Once when I was with General Paget he had two long-range guns, but I was always with the mounted troops in front, so that I never saw them working. In the latter phases of the war it was certainly not worth while dragging about heavy guns, because mobility was then of the greatest importance.

18071. What was your experience of machine guns?—I do not think that machine guns are much use with mounted troops. In fact, I discarded mine in the latter phases of the war. In attack I do not think they are much use owing to the difficulty of getting them in position in time. Of course they are extremely valuable in defence of a position, and with convoys; they are excellent to protect a convoy if there is one in front and one behind; and I found them extremely valuable with the armoured trains.

18072. You are of opinion that the artillery officers should be equipped with field glasses?—I think that all artillery officers should be equipped with the best field glasses obtainable. I mean to say that the Government should provide them, and should insist upon their officers having only the best glasses. Some of the officers only had very inferior glasses, and in the latter phases of the war, when they shot at very long distances, the glasses were not good enough.

18073. Had your scouts no glasses?—Yes, they had a certain number of field glasses.

18074. Were they good glasses?—Yes; of course they only had what they happened to provide themselves with. Some of the Colonial contingents had a certain number of glasses, and their officers had glasses.

18075. But trained military scouts you think ought to have a good glass?—A glass, and a telescope, too.

18076. Do you prefer the telescope?—Personally I cannot use the telescope, but all my good scouts could—they always used it. I think certainly they ought to have it. I have been talking to scouting officers, and they say they ought really to have both.

18077. You think you ought to have some men who can use both?—Yes, a good scout really wants both, because of the different lights.

18078. But, of course, it requires training to use the telescope?—Yes.

18079. And you think there are a great many men who could use the telescope, and that it would be an advantage for them to have it?—Distinctly. We had some men, guides and so on, who all had their telescopes.

18080. And what is your opinion of the service rifle?—I thought the rifle came out very well indeed; I thought it was an excellent rifle; the sighting might be improved, but I think it stood the wear and tear extraordinarily well, and I think at the end on the whole the majority of the Boers would have preferred it to their own rifle. At the end, of course, they had to take it, because they had not any Mauser ammunition, but I think among the intelligent Boers the majority preferred our rifle to their own.

18081. Is there anything else that you would like to add?—I would like to say, with regard to the war, that I think it showed us what could be done by mounted rifles, mounted troops. I think it is important that we should train men to act as mounted infantry, and the more we can train the better. I think the fact of their being so trained, so far from being adverse to their training as infantry men, is very much in their favour, because they learn all the duties of scouting and so on after having been mounted, so that when they come back to their battalions they are certainly better men.

18082. The conditions in South Africa were peculiar, of course?—Yes, in any other war we may not be able to use mounted infantry to such an extent as we did in this last war. And one of the chief points, of course, was that the enemy were all mounted rifles practically. Still, I think it showed us what can be done with mounted infantry or mounted rifles, whichever you choose to call them—mounted men with rifles, I mean.

18083. (*Viscount Esher.*) What you mean I suppose is that there is every advantage to be gained by increasing the mobility of infantry?—Certainly.

18084. Then do you think it would be a good thing to pass all the men of an infantry battalion through a mounted infantry course in time of peace; is that your suggestion?—I do not think they could all be passed through. If in every battalion there was a fourth trained, I think that would do very well.

18085. Would there be any objection to passing them

Major-General
H. C. O.
Plumer, C.B.

12 Mar. 1903.

all through?—Only the difficulty of doing it all in the time, and providing the number of horses for the training and so on, if the present system is retained and one company at a time trained.

18086. How long does it take to train a company?—They train them now in three months.

18087. Then you would only be able to train one company of a battalion annually, I suppose?—I do not think they do more than that at present; they have not the establishment at present to do more; they have not the number of horses to do it.

18088. Then you could not very well train mounted infantry, I suppose, except during the summer months?—Not effectively.

18089. Then you might get two companies of a battalion under training in a season?—Yes, but then they have to be taken away from other duties.

18090. I mean in succession. Is not that the present scheme in point of fact?—I think the present scheme is to train two companies.

18091. To train as many as you can?—Yes, to train as many as we can.

18092. You do not see any objection to passing as many men through a mounted infantry course as possible, do you?—No, because when it comes to war, if we had a Reserve who had been through a mounted infantry course, I think it would be of very great value.

18093. Were the men under yourself all through the war exclusively mounted men?—I had three or four companies at a time to do convoy and baggage work, but I never commanded infantry in action.

18094. But towards the end of your command, towards the end of the campaign, did your command differ as regards the men—did you have more Regular troops under your command then?—I had some mounted infantry then.

18095. How did they compare with the Irregular Force which you commanded in the earlier part of the war?—I should not like to say very much as to that, because the mounted infantry that I had happened to be men who had just come out, one of the later battalions that came out from England, and they compared of course very unfavourably, so far as scouting and finding their way about, with the earlier ones. I would send out 100 Colonials, as I say, and would go to sleep quite happy, knowing that they would be all right. If I had sent 100 mounted infantry out, I should have been very uneasy. They would fight well enough, but they had not a knowledge of the country, or how to find their way about, or of scouting; that could only be got by experience and training.

18096. I suppose the mounted infantry showed a great want of knowledge of horsemastership, too?—There, of course, the regular officer came in. No, they did not show a great want of knowledge of horsemastership at all. I think they were better in that respect, because the regular officer and regular discipline came in.

18097. Then as regards the care of horses, you think it is as much a matter of discipline as of knowledge?—Yes, I think quite as much. A man can be trained to look after a horse; it does not require any great knowledge to look after his horse, as long as he does things at the proper time—grooms him, feeds him, waters him, and is always thinking about his horse. A man can very soon be taught what he has to do, as long as one can be sure that he will do it, as regards looking after a horse. I am not talking about technical knowledge, of course, such as veterinary knowledge.

18098. Are you at Aldershot now?—Yes.

18099. Have any steps been taken to apply the lessons of the war in that direction, so far as you have knowledge?—About what?

18100. As regards horsemastership?—I am now in command of an infantry brigade, you see, and that is outside my work.

18101. And the mounted infantry course has not begun yet?—Yes, it is going on now.

18102. At Aldershot?—Yes, but I have only just seen them incidentally.

18103. Have you heard it suggested that it would be a great advantage to an infantry battalion to have mounted signallers under them?—Yes, I have heard it suggested, and I think it certainly would be a great advantage.

18104. (Sir Frederick Darley.) There was an attack

and a defence at Elands River, was there not?—Do you mean under Colonel Hore?

18105. Yes. Was that under your command?—No, I was at Rustenburg when that was going on.

18106. Are you aware of the great loss of horses between Beira and Buluwayo in that contingent commanded by Colonel Airey?—Yes, I know there was a great loss there.

18107. That was from eating some poisonous plant, was it not?—I should think it was a very unhealthy place where they were; it was pretty hard on them at times. I cannot remember the name of the place now, but it was in Mashonaland, and it was a very bad place, I know by reputation, but I do not know it personally—I have never been there. I should think that is where they lost a great number of their horses—in fact, I know it is.

18108. To go to another matter, how would you recommend that the staff officer who, you said, should be relieved from peace routine duties should train the regimental officers; would it be by lectures?—Not entirely. I would allow him to take the officers of a certain unit out and go over a tactical problem with them; that is one of the duties which I think he might perform very well. Personally, in my brigade, I should be very glad to have an officer like that. I should say to him: You will set them a scheme and go out and explain to them exactly on the ground how it would work out. And then another thing which he might do, I think, would be to give them lectures in the way of teaching them how to teach, drawing up examples in a short lecture of the way in which they should lecture to the men, because in my experience just lately as a general officer, I have heard officers commanding companies lecturing to their men, and in many cases they have worked up the subject very carefully, and taken a great deal of pains about it. I feel certain that they are absolutely doing all that they know, but they do not seem to be able to put their lecture in the way quite that the men will understand, and I think a little teaching in that way would be a great benefit to them.

18109. That is to say, they do not understand how to impart the knowledge that they have?—They do not know how to impart the knowledge that they have to the men. They could answer any question that might be asked about the particular subject set them; if they were asked questions they would answer very carefully, very intelligently, and very well; but I find that when they come to talk to their men, as I make them do, they do not seem to be able to express their subject in the way that the men might realise, and I think they want a little training in that way.

18110. You think they might be taught how to do it?—I think so. I think anybody might be taught that.

18111. There is only one other question I want to ask you. You spoke of the pom-pom shell, and you said that it is not a dangerous shell, in your opinion?—I do not think it is.

18112. What is the radius of danger?—It is very small, but I could not tell you exactly offhand what it is. It is the moral effect of these shells going off very quickly one after the other that makes them useful. You would think that they must hit; but somehow they do not. In my experience, I know we fired a tremendous number of pom-pom shells, and I am quite certain that they hit very few Boers. The pom-pom officers that I had were excellent, I am sure. I watched them shooting, and I am sure they were shooting very well and carefully. But I think the pom-poms have a tremendous moral effect. I have had them against me, too, in the earlier part of the war, and it was very unpleasant.

18113. (Sir John Jackson.) Did you find the Colonial troops better educated, as a rule?—I found that they varied very much. Do you mean in the way of their being able to read and write, and so on? The New Zealanders, I should say, were better educated than most of them. I think throughout, the New Zealanders were a better class.

18114. Quite so?—I found that they varied very much.

18115. Were they a better class than the Australians?—Yes.

18116. And the Canadians?—I only had one battery of Canadians, and they were certainly very good men; but as compared with the Australians, I think the New Zealanders were the better class.

18117. You spoke of the advantage to the Colonial

troops of being under the command of Regular officers; I suppose you mean regimental officers?—Yes, I mean regimental officers.

18118. Then if you bring in Regular regimental officers to command the Colonial troops, what would you make of the Colonial officers—where would you bring them in?—I think they would have to take the place of the subalterns. If we had a mounted unit, I should make the squadron commander a Regular officer, if possible; if I had the selection, and could do it in my own way, I should make the squadron leader and the adjutant regimental officers, and the troop officers Colonial officers.

18119. Do you think that a plan of that kind would not be much resented?—I do not think so. I think they would have resented it at the beginning of the war, but I honestly think that the majority of the men themselves would far rather have gone into action or gone out on trek under Regular officers.

18120. But would the Colonial officer resent it?—He might; naturally he would prefer to command himself, that is only human nature; but the question is whether it is better for the unit.

18121. Just one question with regard to relieving the fighting officers of clerical work, or, as you term it, financial responsibility?—I do not think I said clerical work. I do not mind their doing clerical work.

18122. You spoke particularly of financial work?—Yes, I did, because I am sure it weighs upon them.

18123. It has been said that where the captain pays his regiment it brings him into better touch with his men, would you say that that was the case?—Yes, it does in some ways; it has that advantage, no doubt; but then, again, it has a little disadvantage, because the man has a little feeling that the captain, perhaps, is, I will not say withholding his pay, but is not giving him as much as he might do for fear of himself, the captain, being a loser.

18124. So that in that way it is a disadvantage, you

think, for the captain to pay his men?—Yes, I think so. I quite agree with you that there is a slight advantage in bringing him more in touch with his men, but I think that that is more than outweighed by that feeling which I think exists; and then I say it is still more outweighed by the enormous advantage of relieving officers of financial responsibility.

18125. (*Lord Stratheona and Mount Royal.*) From your very varied experience during the war, do you consider that it would be an advantage to have a special body of scouts distinct from the Mounted Infantry—trained men selected for their general intelligence and long sight—attached to the Army?—Yes, I think it would be a distinct advantage to any force in the field to have such a body of men, certainly.

18126. There is no such corps now, I believe?—No, there is not.

18127. Then you think it would be well that there should be such a corps?—Yes, I think so; you mean recruited perhaps from any part of the Empire?

18128. Yes?—You might have some Colonials or anybody?

18129. Yes, certainly men selected for their long-sight and general intelligence?—Certainly.

18130. You say that the Canadian wagons were very good and of great strength and durability; they were also, were they not, for their capacity very light in weight, made of the strongest material—hickory wood. I think?—Yes, they were hickory. I should have said that they weighed actually heavier than the South African wagons. I am bound to say that I never actually weighed them, but they certainly seemed heavier in draught so far as one could judge by the animals drawing them.

18131. And though not capable of carrying so much as the ordinary South African wagon, they were good of their kind?—I thought they were very good.

18132. (*Chairman.*) Is there anything else that you wish to add?—There is nothing more I wish to say.

Lieut.-General Sir W. G. NICHOLSON, K.C.B., R.E., recalled and further examined.

(See Questions 1 to 158 and 264 to 457, Vol. 1, for Sir William Nicholson's previous evidence.)

18133. (*Chairman.*) When you were before us on the last occasion, the 15th of October, at the end of your evidence then we said that we would like perhaps to hear from you some evidence connected with the offices which you actually held during the war?—Yes.

18134. Would you in the first place tell us exactly what those offices were?—I was first Military Secretary to the Field-Marshal Commanding in Chief from the beginning of January, about the 14th of January to the 21st, I think it was, of February. After that, owing to the transport arrangements being in a state of some confusion, Lord Roberts asked me to undertake the duties of Director of Transport at headquarters.

18135. And you held that position throughout?—I held it until I left South Africa.

18136. And you came home with Lord Roberts, I think?—I went back to India. I left shortly before Lord Roberts. I was still Adjutant-General in India, and I had to rejoin my appointment before taking leave to come home.

18137. Then the Directorship of Transport was really the office that you held?—Yes, during most of the time. I also performed certain military secretary's duties while I was Director of Transport, but that is, perhaps, immaterial.

18138. With regard to the question of transport, I think you refer us to a dispatch which Lord Roberts wrote, and which appeared in the "London Gazette" of 16th April, 1901?—Yes, as an appendix to the "Gazette." (*Vide Appendix Vol., page 234.*)

18139. Does it set out in full the argument which you would give for the exchange which was then made?—Certainly.

18140. I daresay you are aware that there is a difference of opinion on the matter of the necessity of superseding the regimental transport?—There is a difference of opinion, but I think that is chiefly due to the fact that the officers who advocate the regimental system are accustomed to it on a small scale, and undoubtedly in the case of a small expedition, a column of a couple of thousand men, the regimental system answers extremely well. Where there are large bodies

of troops, a considerable number of whom must necessarily be stationary, as garrisons or guarding lines of communication, if the regimental transport system is kept up a great deal of the transport is wasted.

18141. Do you think it is altogether confined to an objection of that kind?—I think it is a matter of scale. I have seen both systems used in India for columns of moderate strength; but whichever system is adopted in the first instance, the regimental or the departmental system, in larger operations, such as the Afghan War, we have to go to the departmental system.

18142. We had evidence from Lord Wolseley to the opposite effect; he was strongly in favour of the regimental transport system?—Well, I can only say that in South Africa we could not have moved at all with the regimental transport system. We never should have got to Bloemfontein for about six months, I should imagine.

18143. That is what I really want to get at, whether it was peculiar to the position in South Africa or whether it is a question of a general system?—As a general system I think it is obvious that, if transport is allotted regimentally, every Commanding Officer wishes to keep it. He sees, no doubt, that it is efficient, but he does not like to part with it; and when he has to halt (and he may be halted for a month or three or four months), the whole of that transport is wasted; it does nothing. The regimental system is a most extravagant system in large operations.

18144. (*Sir George Taubman-Goldie.*) The Commander-in-Chief in the field would always have power to call it up at any moment?—If he called it up from regimental charge he would have to take away the regimental officers and non-commissioned officers who look after it. The result would be that he would dislocate the whole machinery. He would take officers and men that could not be spared, and then whom would he get as the superintending or supervising authorities over this mass of regimental transport?

18145. (*Chairman.*) This is the answer to which I refer. The question put to Lord Wolseley was: "It See was represented that there was a great loss on regi-

mental transport if the regiment was halted for a considerable time at one place—that that transport was lost for the general movement of the Army?” and his answer was: “That may be the case, but that is easily got over, as I have seen very often, in this way—if you have a halt for any length of time you club the regimental transport together to carry stores and use it under the superintendence of brigade organisation for the time being; but the very moment that any battalion moves it should move with its own regimental transport, and in that regimental transport you almost always carry either a day or a day and a half, and sometimes even two days’ provisions.” I only read it to you as showing that there is some basis for the other opinion?—Yes, I quite understand that, but my experience has been, both in India and South Africa, that if you have a regular transport organisation on a departmental basis, it works much better on a large scale than the regimental system. On a small scale the column is continually moving, or, at all events, it halts together and moves together, and the regimental transport has the advantage that the Commanding Officer, for the sake of the mobility of his own regiment, takes as a rule the utmost trouble in looking after the animals, while the departmental officer has not that personal interest in the matter that the regimental officer has. But as regards the general movements of a large force, I think it stands to reason that a departmental organisation, especially fitted for the purpose of transport, is better than the sort of improvised system which Lord Wolseley would adopt.

18146. But as I understand the organisation of which the regimental transport is a part, there is always behind the regimental transport the departmental system with the supply columns and supply parks?—Yes.

18147. That is always departmental, is it not?—That is always departmental.

18148. So that it is only a question whether the regimental system should continue for the purposes of the three or four days’ or week’s supply?—For what is called the second line of transport. The first line of transport is water carts, ammunition, and entrenching tools. That it has always been admitted should be in regimental charge.

18149. Then there comes the regimental transport for a day and a half or two days’ supply?—It is more than that; in South Africa we generally carried four or five days’ supply in the second line of transport.

18150. But behind that, under that organisation, there must be the departmental organisation?—Yes, certainly.

18151. And that would provide for the movement of larger columns, would it not conceivably?—It is generally a slower and heavier form of transport. In South Africa the second line of transport was entirely mule transport; and the supply columns and supply parks transport was ox transport, which moves much more slowly. So that it would not have effected the object to have utilised the ox transport if it could not have accompanied the troops, more particularly the cavalry. It could not have kept pace with the troops at all, as a matter of fact.

18152. Again I say I want to know whether it is a question as regards South African conditions or whether it is a part of your idea for the general organisation of transport for the Army in the future?—It is my idea of the transport organisation of the Army in future.

18153. That there ought not to be a regimental transport in that sense—a second line?—No, unless in the case of small columns up to, say, 2,000 men, or something of that sort, which is operating as an expeditionary column; then it is just as well to hand over the transport to the units.

18154. Does that mean that you have the departmental system and that you break it up at the beginning of the small war and hand it over to the regiments?—I do not think we can ever have a complete transport establishment in peace time; it is so exceedingly expensive. I do not think even in India they could keep up anything like the amount of transport they would require on a large scale, and therefore the organisation has to be very largely expanded in the event of war.

18155. Of course; but still, as it stands at present, the theory of the organisation is that each regiment has a certain amount of regimental transport in the second line?—Yes, but without animals.

18156. You would do away with that?—I would do away with that.

18157. And you would have a substitute of some kind—I suppose the departmental system?—I would have a departmental system capable of expansion.

18158. How would that work in peace time?—No regiment has transport allotted to it in peace time. There is a purely departmental system in peace time anyhow, because the Army Service Corps are simply quartered at the stations where their services are required, and they are not attached to regiments.

18159. I ought to have put it perhaps on mobilisation. Under the former system each regiment took its transport, did it not?—Yes.

18160. Instead of that you would have the departmental system with the same general amount of transport?—Yes.

18161. And if you had a small column operating you would sub-divide it, and hand it over to the regiments?—Yes, simply hand over what they required.

18162. Instead of under the present system, as Lord Wolseley says, you would have it sub-divided for regiments, but club it?—Yes.

18163. You consider it is better to provide a general departmental system for the larger expeditions?—Yes, certainly.

18164. Even if you had to sub-divide it if it should come to a small expedition?—Even if for a small expedition it is temporarily handed over to regimental charge.

18165. It has been represented before us that though this operation was carried out under your superintendence for the march to Bloemfontein, in the subsequent stages of the war the transport really became regimental again?—I have no knowledge of that. We made no change through the march to Pretoria; and down to the time to Komati Poort the transport was entirely under the departmental system, but what Lord Kitchener may have done afterwards, when the country settled down, at least to a certain extent settled down, and he garrisoned it, as it were, by columns in different districts, I cannot say.

18166. I do not think it was exactly put to us that there was a general reversal of your decision, but that, as a matter of fact, the transport became attached to regiments with this disadvantage, that it was not the regimental transport of which the regiment was proud, but was simply a transport which by an accident had become attached to it; but that, as a matter of fact, it went back to the transport allotted to each regiment?—They did away with my appointment, and converted the head of the transport into Assistant Adjutant-General for Transport. The new appointment was held by Colonel Wickham, an officer of the Indian Staff Corps. I saw him when he came home, and I asked him how the thing had been working, and he seemed to imply that it had been worked on the same system; but here was the difference, of course, that, especially towards the end of the war, they were operating in the way I say; that is to say, in small columns of about 2,000 or under, and in that case practically the transport remains permanently with the columns; there is no necessity or no advantage in transferring it from one column to another; and in that way it certainly does become, as it were, attached to the column. But, still, there were the departmental officers and the transport officers in command of the various mule companies; they did not hand over the mule companies to the officers commanding units. But certainly the transport became much more attached to the various columns than it was attached to the regimental units which we were moving, or halting in pursuance of a large scheme of operations during the earlier period of the war, because we continually transferred it as the necessity arose. I think that is the explanation of that.

18167. If the departmental system was to be adopted as the general system for the Army, you would require to expand the department, would you not?—I do not think we would require to expand the department in peace time, because almost all of the transport officers in South Africa were special service officers of all branches of the Service who went out to South Africa, and were placed at my disposal for transport work.

18168. Did not that create some difficulties?—They worked very well. There were very few failures. I was quite astonished at the way they worked.

Lieut.-
General Sir
W. G.
Nicholson,
K.C.B., R.E.

12 Mar. 1903.

See Q. 14008.

Lieut.-
General Sir
W. G.
Nicholson,
K.C.B., R.E.

12 Mar. 1903.

18169. We have had here some evidence that when you had the Army Service Corps officers things went quite right, but that there was a little less regularity when you had not the Army Service Corps officer in charge; was that your experience?—I cannot say that. Of the two officers who particularly distinguished themselves in the matter, one was Colonel Money, an Artillery officer, who was Persian interpreter to Sir William Lockhart. He really, I should say, was one of the very best of the officers. Then there was Colonel Wickham, of the Indian Staff Corps, who succeeded me as the head of the department. If I had a list I could point out many of the officers. I should say that although the Army Service Corps officers did well, there were several officers of other arms of the Service who did better.

18170. Oh, no doubt, that might be; but for the general work of the department would you not require to have the trained Army Service Corps officers if you establish it on a large scale—a separate department?—We certainly would require that nucleus of officers.

18171. Lord Esher refers me to a piece of evidence of Lord Kitchener: "Lastly, in urging the formation of a separate transport department, I would point out that there is no more important work in any branch of the Army, and none in which a thorough and careful training is more necessary, more especially at a time like the present, when mechanical transport will probably be an important adjunct to the military transport service." That was the point that I was putting.

(Viscount Esher.) You think there should be a separate transport department now. Is that what you said just now you were trying to work out?—We are trying to work out a method of providing a certain amount of personnel and a certain number of trained officers in transport work.

18172. Is that practically a separate department?—That in peace time would be under the Quartermaster-General, and the officers would be found from the Army Service Corps.

18173. It would be a branch of the Quartermaster-General's department, of course?—Yes.

18174. Who is working it out; is it being worked out by the Quartermaster-General, or by you?—I have to work out the war establishments on which the amount of transport required for an armed force in the field is based, but we are confronted by this very considerable difficulty, that we operate in so many different countries. If we provide at home wheeled transport and harness, and so on, on a large scale, say for six Army Corps, we may never require it, and if, for example, an officer is trained with reference to horses and so on (wheeled transport and horses), that officer is not of very much use if we are using camels, as we are doing at present in Somaliland; or, if we sent out reinforcements to India, where we have mules and camels, there again this training—it is of some use, but is not as valuable as it would otherwise be. But I may say that they had a very exhaustive Committee in India, of which General Sanford was president, to consider the question of transport, the report of which I can no doubt furnish to the Commission if desired (I believe I have a copy). Their report is in entire accordance with this departmental system; they condemn the regimental system.

18175. Are they necessarily inconsistent, because I should have thought the transport department could, in certain instances, where required, apply the regimental system?—That is what I say, certainly there is no difficulty. This proportion of transport (the second line transport), which in the case of South Africa was mule transport, is simply handed over. Say a column is going to relieve Mafeking (there were four mule companies wanted for it): you can say, if you like: "Here we hand over to you four companies of mule transport; you can place them if you like in regimental charge."

18176. But you could do that through the central organisation, such as you mention, in every case if you thought it desirable?—Certainly, but I say that unless there is the organisation of the departmental system the reverse cannot be done.

18177. (Sir Frederick Darley.) When you hand over the transport, would you hand over the transport officer?—Yes, he would remain probably there with the General until the operation was concluded, when he would take it over again.

18178. If you were handing over a small column, you would hand over the transport officer with it?—If the transport were placed in regimental charge the transport officer would be relieved of responsibility for it for the

time being, but when the column had completed its work there would have to be somebody to pick it up again and move it away to wherever it was wanted, therefore the departmental transport officer would probably accompany it, though not in charge of it.

18179. (Sir George Taubman-Goldie.) There the argument on the other side comes in, that a small unit, having temporary charge of the transport, would not take the same care of it as it did in the past when it had special charge of it?—I quite admit the disadvantage, but it is much less than the other disadvantage, that the regimental system in large operations is so frightfully extravagant; and then if you maintain complete regimental transport you have a difficulty in feeding it, as the number of animals increases so enormously. We should have had to have more than double the transport that we actually had.

18180. (Chairman.) I do not quite understand why the regimental transport, as it existed, could not be picked up and made part of the departmental transport as well as the contrary conversion which you have just described?—Because, I should not have had the departmental officers needed if I had had to pick it up at the moment. In each mule company I had the officer commanding it and one or two junior officers under him; I also had non-commissioned officers and certain subordinates. When it was in regimental charge there was a regimental officer appointed to take charge of it, and he had non-commissioned officers from the regiment under him. If it had been handed over to me they would not have spared those regimental officers. In the first place, they said they had too few officers as it was, and they would not spare them; and I could not have taken away the non-commissioned officers and men from the regiment.

18181. Were those men who were in charge of the transport ordinary regimental officers on the strength of the regiment?—Yes, that was the system—to appoint a regimental officer. So much transport is handed over to the commanding officer, who says to some captain or subaltern, "I place you in charge of that, and you will accompany it, except when we engage the enemy," and in action with the enemy he is supposed to leave the transport and join his company.

18182. With the result that the personnel of the transport must separate from the regiment?—No, it was not so under the regimental system.

18183. And the non-commissioned officers must go into action, too?—No, I think that the non-commissioned officers were supposed to remain with the transport.

18184. He would be left with the transport?—Yes, the non-commissioned officers and men would be left with the transport. Probably there would be two or three men with it.

18185. I only bring to your notice the fact that there has been a good deal of evidence before us still maintaining that the regimental transport system is the preferable one?—Well, all I can say is, I do not think it could have been adhered to. In fact, Sir Elliot Wood, the Commanding Royal Engineer, told me that when Sir Redvers Buller first went out there he was in such despair about his transport that he consulted with Sir Elliot Wood, and they both came to the conclusion that a flank movement to Bloemfontein was out of the question across the Orange River until they had made the railway, and that the railway would take six months.

18186. (Sir John Edge.) I suppose anyone looking at it from a regimental point of view would stick to the regimental transport?—Yes, certainly; and it has the advantage that it is the personal interest of the regiment to keep it as efficient as possible.

18187. (Chairman.) Is there anything else on the transport question that you would like to say?—No, I think not. I think that Appendix to the "Gazette" gives the whole story of it. (Vide Appendix Vol., page 234.)

18188. Then you are prepared to speak to the training of staff officers?—Yes.

18189. And you have been good enough to put down some views on paper. Perhaps we might take that as your evidence?—Yes, that is my view on the subject.

Training in Duties as Staff Officers.

It will probably be of interest to the Royal Commission to contrast the system of the organisation and training of the Staff of the Army which existed at the time of the Peninsula and Crimean wars with that which was

See Q. 186.

in force at the outbreak of the South African war, and to consider what has been learnt in this matter from the practical experience of the recent campaign.

From the eleventh report of the Royal Commission which was appointed in 1805 under a special Act of Parliament to enquire into the conduct of public business on the Military Departments of the Army (page 14), it appears that the duties of the Quartermaster-General's Department at that time comprised the movement, quartering, and encamping of troops; the disposition of troops in the field, the preparation of plans of defence, military surveys and reconnaissances, and the maintenance of a dépôt of military plans, maps, and memoirs and of a military library. A Quartermaster-General's Staff was at this time assigned to all British armies in the field, and to all commands at home and abroad. In peace, Assistant Quartermaster-Generals of districts were, under the "General Regulations and Orders for the Army," dated 1811, charged under the orders of the General Officer Commanding with the duty of quartering, encamping, and the marches of troops. In coast districts they were expected "to possess accurate information as to practical points of landing, the best positions for defence in their immediate vicinity, and the particular winds and periods of tide which afford an enemy facility in approaching the coast." In all districts they were expected to have a perfect knowledge of the state of the roads and the features of the country applicable to defence; also of the course of rivers and the power of inundation. They were required to attend the embarkation and disembarkation of troops. As an instance of the nature of the work which was carried out under these orders, it may be mentioned that during the short truce of 1802-3 officers of the Quartermaster-General's Department were employed in reconnoitring and sketching, in fullest detail and on a large scale, the south coast of England from Portsmouth to the mouth of the Thames. Officers employed in the department, as a rule, received special training at the Royal Military College, which was founded originally at the close of the first French Revolutionary War as a school of instruction for young officers of the staff.

From the "special instructions" issued in 1810 by the Duke of Wellington's Quartermaster-General to the officers of his department then employed with the Army in the Peninsula, it appears that their duties in the field comprised the movement of troops, their disposition on the march and in the field, including the throwing out of outposts, billeting, all reconnaissance work, and the provision of guides and interpreters. It was laid down that "one of the first duties of the officers of the Quartermaster-General's Department is to acquire a knowledge of the country which is the theatre of operations of the Army. This supposes not only an acquaintance with the nature and political condition of the country and with its principal features, but also detailed information on the following points:—

1. The peculiar nature of each district of the country and its productions.
2. The rivers and lesser streams and the canals.
3. Population, resources, accommodation of troops, etc.
4. Roads.
5. Camps and positions."

It is apparent, therefore, that at this period the officers of that branch of the staff, which was held responsible for directing the operations of the troops in the field under the orders of the General Officer Commanding, were practised and trained in those duties in peace time by the exercise of similar responsibilities, so far as peace conditions allowed.

The result of this system may be gathered from a very interesting report on the British Army prepared in 1820 by a field officer of the French Engineers, M. Charles Dupin, in which he attributes the success of the British forces in the Napoleonic wars against his own nation in a great measure to the excellent training of the British staff. He says: "The English, in bestowing extra attention upon the general formation and accidents of ground, have acquired great tact and an extraordinary facility of rapid judgment in the selection of advantageous positions on an important emergency. The excellence of their lines of battle at Aboukir, Vimiera, etc., may be adduced in proof of this."

The duties of the Quartermaster-General's Department at the outbreak of the Crimean War had remained unchanged since the Peninsula war, and the "special instructions" of the Duke of Wellington's Quartermaster-General, above referred to, were re-issued from

the War Office on the 20th March, 1854, for the guidance of the Quartermaster-General's Department. There is reason, however, to fear that during the long interval of peace the practical training of the staff had been allowed to fall into abeyance.

In April, 1873, an Intelligence Branch, under a Deputy Adjutant-General, was created at the War Office for topographical and statistical purposes. In July, 1874, the branch was enlarged, and placed under the Quartermaster-General, its head being styled Deputy-Quartermaster-General. In 1882 the Deputy Quartermaster-General, Intelligence Branch, was replaced under the orders of the Adjutant-General, and in 1887 he was again called Deputy Adjutant-General, his title being converted the following year into that of Director of Military Intelligence. He remained subordinate to the Adjutant-General until 1895, when he came under the direct control of the Commander-in-Chief.

As regards the Quartermaster-General's Department generally, no radical change was made in the allotment of staff duties up to the year 1888. In the Queen's Regulations for 1885, Section 5, Paragraph 81, the general nature of the duties of the Quartermaster-General's Department was classified as follows:—"The officers of the Quartermaster-General's branch are entrusted with the duty of quartering, encamping, embarking, disembarking, and moving of the troops in every situation of the Service. Their special duties in the field will be to regulate the order of march; to define the positions to be taken up by the troops, to conduct reconnaissances, to superintend the arrangements necessary for collecting information regarding the movements of the enemy, and the local resources of the country, to maintain the lines of communication, to have a general direction over the railway, postal, signalling, and telegraph services of the Army."

In 1888 the Commander-in-Chief was made directly responsible for the supplies of the Army, and in consequence of this the duties of supply and transport were taken over by the Quartermaster-General's Department at the War Office. It was decided at the same time, with a view to improving the status of officers employed on these departmental services in districts at home and abroad to give such officers the status and title of Staff Officers of the Adjutant-General's Department, the previous titles of Assistant and Deputy Assistant Quartermaster-General, except at headquarters, being abolished.

The old Quartermaster-General's Department was thus completely reorganised, and, except as regards the movement of troops, became mainly responsible for departmental duties, especially those of supply and transport.

The Queen's Regulations for 1889, Part II., Section 5, Paragraph 71, divided the duties of the General Staff into two groups, (a) and (b); (a) including discipline, interior economy, drill, military training and instruction, musketry, signalling, camps and schools; (b) arms, ammunition, clothing, equipment, supply, transport, movements, distribution and quartering, barracks, charge of garrison libraries, hiring of buildings and land for camps, ranges, etc., Royal Engineer services, works and fortifications. Subsequently, in 1895, so much of Artillery, Engineer, Ordnance, and Medical services as were included in the above were dissociated from duties (a) and (b), and dealt with separately, the officers of the (b) branch of the staff remaining responsible solely for supply, transport, movements, distribution and quartering, barracks, camps, and hire of buildings and land for camps, ranges, etc.

From 1888 onwards the officers appointed to the (b) branch consisted almost entirely of Army Service Corps officers, who, though possessing expert knowledge of the departmental portion of their duties, i.e., those connected with supply and transport, had no special training or qualifications for the performance of the other staff duties originally appertaining to the Quartermaster-General's Department.

It resulted from this system that, when the South African war broke out, the officers of the (b) branch, who under the old system should have been responsible for the movement of troops and conduct of operations in the field, were not qualified to carry out those duties by special training and practice in peace time. Even had they been qualified, they would not have been forthcoming, inasmuch as every Army Service Corps officer who could be spared for field service was needed for supply and transport duties, and to meet these requirements the establishment of the Army Service Corps had to be largely increased.

In India alone the system of maintaining a specially-trained Quartermaster-General's Department had been adhered to, and the Commissariat Department had been

kept separate from the General Staff, although even in India, except at headquarters, the titles of Assistant and Deputy Assistant Quartermaster-General were converted at the instance of the War Office into those of Assistant and Deputy-Assistant Adjutant-General. Officers, therefore, with Indian experience were the only officers who since 1888 had received practical peace training in the most important duties devolving on the General Staff in war. This defect was much felt in the conduct of operations in South Africa, and as a result in the present Army Corps organisation, staff officers, styled Assistant or Deputy-Assistant Quartermaster-Generals, have been provided, whose duties include the movement, distribution and quartering of troops, concentrations and manœuvres, mobilisation and intelligence, and the preparation and revision of local defence schemes. Similar changes will shortly be made in the staffs of Colonial commands, and it is hoped that this reversion to the system in force under the Duke of Wellington will enable staff officers in Army Corps, divisions, and districts to be properly trained in peace for their work in the field.

18190. The general question involved is the position of the Quartermaster-General's Department, is it not?—Yes, it is the question of the department which has to carry out the duties originally allotted to the Quartermaster-General because at present the Quartermaster-General's Department is for all practical purposes a Commissariat Department.

18191. (Sir George Taubman-Goldie.) Will you specify the duties to which you refer that he should carry out?—That he did carry out; because you allude to different dates there.

18192. The duties that you say he should carry out?—The duties he was supposed to carry out up to 1888 were in most respects the duties originally laid down.

18193. At which period—the Crimean war period?—The period of 1810, it appears to me.

18194. (Chairman.) Does that include your department in the Quartermaster-General's Department?—The position is an extraordinary one at the present time, because a great many of the duties which, under former regulations appertained to the Quartermaster-General's Department, have now been transferred to my department. All duties connected with preparation for war, mobilisation, and so on; in fact, my department performs almost the whole duties of the original Quartermaster-General's Department, with the exception of the movement of troops. The movement of troops is an old Quartermaster-General's duty, and it is the only one of the old duties that the Quartermaster-General has retained.

18195. (Viscount Esher.) Then you have become Quartermaster-General under a new name, that is really it?—It is practically so if the movement of troops, which is rather a routine matter, is handed over to me.

18196. (Sir George Taubman-Goldie.) But that is executive work?—Yes.

18197. And your work at present is not of an executive character, it is rather of a thinking out character, is it not?—It is rather of a thinking out character, but many of my duties I should call administrative. For example, in all matters connected with defence or mobilization I have to convey the Commander-in-Chief's instructions or orders to the various subordinate military authorities. I have also to communicate with those authorities to obtain the necessary information. As an instance, I am in charge of the strategical distribution of the Army. When the question of the reduction of the garrison of South Africa came up, it was my duty to telegraph to General Lyttelton, and find out what his proposals were for the strength, composition, and distribution of the future garrison, and Colony, the Cape, and Natal. When I got his views, and the views of Lord Milner, it was my duty to lay the case before the Commander-in-Chief and the Secretary of State, and to obtain their decision as to the strength of the garrison in South Africa. The moment I had obtained that information, and got that decision, it was then my duty to inform the Adjutant-General and the Quartermaster-General; the Adjutant-General, in order that he might select the units of cavalry, artillery, and infantry that were to remain in South Africa, to form this garrison; and the Quartermaster-General, that if units had to be sent out, he might send them out, or, if units had to be brought back, he might bring them back.

18198. Then the executive work of this organisation falls on the Adjutant-General and the Quartermaster-General?—Yes.

18199. You have to think out the process?—Yes, and also to obtain information for that purpose. I will give you another instance. Say there is a case of a defence scheme for Malta. That comes up to my department and is examined there; it then goes through the various other officials, if any, concerned, and then to the Commander-in-Chief for decision on any point that requires modification. When I get that decision I communicate it to the General Officer Commanding at Malta. It would not be my business to take such further action as might be consequent on the decision, but I should communicate the decision.

18200. That is the distinction I wish to draw between the active departments and yours?—Yes, I should not take the action.

18201. Then does not the movement of the troops and so on, which you have not got, come rather into the active department or is that a matter of scheme and thinking out. You plan what movements have to take place, do you not?—Not in detail. For example, I should not plan what the next reliefs are to be for India, or anything of that sort, because that does not affect the established strength of the Indian garrison. If there was a question of increasing the British garrison in India, a question of what the increase should be, whether cavalry, artillery, or infantry, that would be one of my questions; but when that has once been settled, at present it would rest with the Adjutant-General to say what units are to go to India, and the Quartermaster-General has the arrangements for sending them out.

18202. Those are matters of detail?—Yes.

18203. Do you not think it is a healthy thing that your department should be kept entirely separate from mere questions of detail and administrative work. Have you not already plenty to do in thinking out those great schemes?—More than sufficient. Still the curious anomaly is that the Quartermaster-General only possesses one detail of the functions of a Quartermaster-General.

18204. (Viscount Esher.) That is to say of the old functions of the Quartermaster-General?—The old functions of the Quartermaster-General; and I do all the rest of the old Quartermaster-General's duties.

18205. (Chairman.) Was all the work you are now describing part of the old Quartermaster-General's Department?—It used to be undoubtedly. It is still in India, where they did not change.

18206. (Viscount Esher.) But in India are the duties which you perform performed by the Quartermaster-General in addition to those of the Quartermaster-General similar to those that the Quartermaster-General here performs?—No, the Quartermaster-General in India has nothing whatever to do with what corresponds to the Army Service Corps' duties; that is to say with Supply and Transport.

18207. Who looks after that?—The Commissary-General-in-Chief.

18208. He is another officer?—He is another officer.

18209. It is little more than a name then is it not; because it only means in India certain duties which you say formerly appertained to the Quartermaster-General's Department transferred to another officer under a different name; and in this country certain duties are transferred to the head of the Intelligence Branch under that name?—But in India there never was any idea of giving the Quartermaster-General Commissariat and other departmental duties, nor was there any idea in England until the date mentioned in this paper.

18210. But then except that it was formerly the case, and there is an old tradition in favour of it, what is the strong argument in favour of the old system, because I understand you are in favour of the old system?—I am in favour of the old system on this account, that at headquarters the present system may work well enough. But Assistant and Deputy Assistant Quartermaster-Generals have now been appointed in the First, Second, and Third Army Corps, and we are doing the same in the Colonies. But they are nobody's child, because though they are Assistant Quartermaster-Generals as regards their functions of concentration,

Lieut.-
General Sir
W. G.
Nicholson,
K. C. B., R. E.

12 Mar. 1903.

manœuvres, field work, reconnaissance, and all that, they are in no way under the Quartermaster-General. If they communicate with anybody except through the General Officer Commanding they communicate with me.

18211. (*Sir George Taubman-Goldie.*) Then let us suppose for a moment that you are re-christened Quartermaster-General, and the Quartermaster-General at the War Office is re-christened Commissary-General; would not that meet the whole case?—It would meet the whole case, but for the movement of troops. The movement of troops has always been the obstacle. I attach but little importance to that, of course, because if I had an Assistant Quartermaster-General under me who dealt with that, that would meet all the requirements.

18212. (*Chairman.*) Then, it is chiefly to bring about a connection with the separate Army Corps that it is of importance to clear up this matter?—Yes, I think it is advisable that there should be some decision arrived at on that point. The Commander-in-Chief entirely concurs in what I say and has on several occasions urged this; but I think the authorities are of opinion that they have had so many changes lately that possibly they might let matters remain as they are for some time longer.

18213. (*Sir George Taubman-Goldie.*) To what extent do you think there might be a connection made between your department (whether called the Quartermaster-General's Department or whatever name it might be), and the Assistant and Deputy Assistant Quartermaster-Generals in the Army Corps—should they report direct to you?—I think they must submit through the General Officer Commanding all official information. They furnish as it is unofficial information to me, but I say it is anomalous. They have no connection with the Quartermaster-General; they have even now an unofficial connection with me.

18214. Then I ask, looking at it as a practical matter, what further connection could they have?—They could have no further connection than that it would make it more symmetrical.

18215. Then it is really for the purpose of making it symmetrical?—Exactly.

18216. (*Viscount Esher.*) Supposing the change were to be made to-morrow, would you have to alter the organisation of your department; would you be able to remain, for instance, in St. James's Square?—I think so.

18217. You think if you were called Quartermaster-General to-morrow you would not have to expand your clerical branch?—All I should do would be to take over the section of the present Quartermaster-General's department that deals with the movement of the troops, which is quite a separate section.

18218. That is practically everything you would take over?—Yes.

18219. (*Sir George Taubman-Goldie.*) And painting a new name on the door?—Yes.

18220. (*Sir Frederick Darley.*) Is the General Officer Commanding an Army Corps responsible for the movement of troops within his own corps, or is that done by the War Office?—I cannot answer positively, but I believe it is still done by the War Office.

18221. So that a regiment may be moved from one district within the Army Corps district to another within that district without the General Officer Commanding the Army Corps having any say in the matter?—He may have a say in the matter. I do not think he issues the orders. But I think it is most desirable that he should; and on several occasions I have urged that General Officers commanding Army Corps should arrange for the moving of units within the United Kingdom, and carry out the movement without any reference to headquarters. However, it is said that there is some difficulty about the railway companies, or something of that sort; I do not know what it is.

18222. (*Chairman.*) They never would be moved without the knowledge of headquarters?—No, they never would be moved without the knowledge of headquarters, but at present the actual arrangements are made at the War Office. In India, where we have the command system, Army Headquarters never interfere. The Lieutenant-Generals holding these commands, equivalent to a large Army Corps, carry out the movements, not only within their own commands, but between commands, without any reference to the Quartermaster-General or the Commander-in-Chief.

18223. (*Viscount Esher.*) But I suppose the General Commanding the Army Corps now could not move troops from one part of his command to another, could he, without reference?—I do not think it is so much a question of reference as of actual movement. An Army Corps Commander at home has to send up to the Quartermaster-General, and I believe the Quartermaster-General makes all the railway arrangements, or if the troops are moving by sea he makes the shipping arrangements.

18224. (*Sir Frederick Darley.*) Take this instance. A battalion at Aldershot has gone through sufficient training there, but there is another battalion at Dover which I believe is in the First Army Corps District, and the General Officer Commanding may desire to bring that battalion up to Aldershot, and send the battalion sufficiently trained to Dover. Can he do that of his own motion?—I do not think so.

18225. (*Viscount Esher.*) Not even if they went by road, and there was no question of railway involved?—No, I do not think so.

18226. (*Sir Frederick Darley.*) Decentralisation has not gone so far as that?—No.

18227. He is still subject to the War Office?—He is still subject to the War Office.

18228. (*Sir George Taubman-Goldie.*) Before you leave that point is the Quartermaster-General at present under the control of the Commander-in-Chief?—I forget for the moment?—No, he is under his supervision.

18229. Then it would be a very large alteration made in case your department was made the Quartermaster-General's department?—I have never yet been able to understand the difference between control and supervision.

18230. Between 1885 and 1889 was there no difference in the relation between those under supervision and those under control?—I do not know what the meaning of the expression is.

18231. (*Chairman.*) I thought the meaning of it was that there was separate access to the Secretary of State in one case and not in the other?—Yes, undoubtedly that is the interpretation placed upon it.

18232. (*Sir George Taubman-Goldie.*) You said in your evidence in October that you must report through the Commander-in-Chief to the Secretary of State?—Exactly.

18233. But the Quartermaster-General I understand can report direct?—He can report direct, but in any military matter that the Quartermaster-General has to do, the Secretary of State would insist upon having the Commander-in-Chief's views, and, as a matter of fact, in any military matter all these officers under the Commander-in-Chief's supervision obtain his Lordship's orders or opinions before they go to the Secretary of State.

18234. That is so at present. But does that follow from the wording of the Order in Council?—I cannot say. I know that is the practice.

18235. Supervision does imply rather a knowledge of what is going on, whereas control implies actual command?—Yes; supervision implies knowledge combined with direction.

18236. There is a distinction there?—Yes; to some extent.

18237. One is watching over, and the other is actually controlling?—Yes.

18238. (*Chairman.*) Is there anything else you want to say on that head?—No.

18239. (*Sir John Hopkins.*) I suppose, as a matter of fact, not a single regiment is moved without the Commander-in-Chief's approval?—It is nominally so; a general list of reliefs, and so on, would be submitted to him, but I do not think he would go into it in detail.

18240. He would approve of the general list?—Yes.

18241. (*Sir John Edge.*) But I suppose it is absolutely necessary that there should be at the headquarters the means of knowing where the different regiments actually are at the time?—Certainly.

18242. It would not do to let the General Officer Commanding in the district be moving his men, and withdrawing his garrison here, and sending them somewhere else?—Certainly not without reporting it.

18243. Therefore, it is more convenient to do the thing from headquarters?—It is more convenient to

Lieut.-
General Sir
W. G.
Nicholson,
K.C.B., R.E.

12 Mar. 1903.

give the order from headquarters, but I do not think it is more convenient to let the actual movement be carried out by headquarters, because it does not train the officers in the work of moving the troops.

18244. I am not talking of the actual movement, but the general orders that such a regiment shall move from one place to another had better come from headquarters, because then you know where they are?—Quite so.

18245. (Chairman.) Then you have also given us a note with regard to the organisation of the Army, which, perhaps, you would like to put in, too?—Yes.

Organisation of the Army.

The establishment of the Regular Army in 1899 was 249,466 all ranks (exclusive of staffs of Militia and Volunteers). This force was intended for distribution as follows:—

	Men.
India - - - - -	73,157
Colonies and Egypt - - - - -	51,204
Home - - - - -	125,105

In addition to the Regular Army the Estimates provided for:—

	Men.
Army Reserve - - - - -	90,000
Militia (including Militia Reserve) -	129,572
Yeomanry (including staff) - - -	11,891
Volunteers - - - - -	264,833
Channel Islands Militia - - - -	3,996
Malta and Bermuda Militia - - -	2,732

The total number of men and officers maintained, including the British garrison of India, was therefore 752,490.

This force was organised in conformity with Mr. Stanhope's Memorandum of 1st June, 1891, which laid down that "the objects of our military organisation" were:—

- "(a) The support of the Civil power in the United Kingdom;
- "(b) To find the number of men for India, which has been fixed by arrangement with the Government of India;
- "(c) To find garrisons for all the fortresses and coal- ing stations at home and abroad;
- "(d) To be able to mobilise rapidly for home defence two Army Corps of Regular troops, and one partly composed of Regulars and partly of Militia, and to organise the Auxiliary forces, not allotted to Army Corps or garrisons, for the defence of London and for defensible positions in advance;
- "(e) Subject to the foregoing considerations and their financial obligations, to aim at being able, in case of necessity, to send abroad two complete Army Corps with Cavalry Division and Line of Communication. But it will be distinctly understood that the probability of employment of an Army Corps in the field in any European war is sufficiently improbable to make it the primary duty of the military authorities to organise our forces efficiently for the defence of this country."

It resulted, therefore, from this organisation that out of a force of 750,000, of whom about 630,000 were normally stationed in the United Kingdom, only two Army Corps and a Cavalry Division—about 70,000 men in all, were organised and available for despatch across the seas for the reinforcement of any part of the Empire that might be attacked, or for offensive action.

Moreover, both these Army Corps were an integral part of the Field Army allotted for home defence.

The first phase of the war in South Africa showed that 70,000 men were inadequate to our needs. We had thus exhausted our organised Field Army, and were forced hastily to build up the Field Army to a total strength of 250,000 men. An army hastily improvised in this way obviously labours under many disadvantages.

The war conclusively proved, therefore, that Mr. Stanhope's Memorandum did not make sufficient allowance for the general needs of the Empire.

It is apparent that contingencies are not unlikely to arise in the future which may again imperatively demand the despatch of a large organised force for the

protection of Imperial interests or possessions across the seas.

Under the six Army Corps scheme, three Army Corps and three Cavalry Brigades will be available for despatch across the sea. The sufficiency of this force to meet possible demands for reinforcements and expeditionary action is a matter for the consideration of the Government. On the other hand, the numerical strength of the Regular and Auxiliary forces which would, with our existing establishments, remain in the United Kingdom, after the despatch of this force, is believed to exceed what would be needed to defend the United Kingdom under existing strategical conditions, provided the Auxiliary forces were efficient.

From the surplus thus left, and from the Colonial forces, it would no doubt be possible in time to improvise such additions to our Field Army as circumstances might demand. But it is impossible to foresee whether time would be available to allow of such forces being equipped, organised, and sufficiently trained to meet Regular troops in the field. It would be wise, therefore, to carry out these processes in peace time, and thus adjust the general organisation of the land forces of the Empire to actual war needs. It is believed that this could be done without augmenting their existing numerical strength.

18246. That shows the establishment in 1899, and refers to the purposes for which the Army was organised under Mr. Stanhope's Memorandum and at the present time?—Yes.

18247. And the material remark that you make is that the war has conclusively proved that Mr. Stanhope's Memorandum did not make sufficient allowance for the general needs of the Empire?—Certainly.

18248. But are you of opinion that the present organisation will?—I am not of opinion that the present organisation will. I think it is inadequate.

18249. Would you explain why?—Under the present organisation we have three Army Corps, say 120,000 men, available in the event of the most serious war we are likely to be engaged in for reinforcements or for offensive action outside the United Kingdom. The question has been gone carefully into in my department, and I am of opinion, instead of having 120,000 men available for reinforcements or expeditionary action, we should have at least 200,000 men.

18250. (Sir George Taubman-Goldie.) On a permanent force?—I cannot say a permanent force; it appears to be very expensive to keep up such a force; but some expedient, unless we are going to be in a very awkward position, must be devised for producing it. Take, for example, the Militia; there is no obligation upon them to serve abroad, unless they volunteer, in the event of war. The Militia is a branch of the Service voluntarily enlisted; they are on the same footing in this respect as the Regular soldiers. Why should not the Militia be made liable to war service outside the United Kingdom?

18251. Then unless you employ the ballot for the Militiaman would he join?—I see no reason why he should not join as much as the Regular soldier joins. The obligation is a remote one, he thinks, and he does not much mind.

18252. Is it not usually the fact that the Regular soldier has no employment whatever when he joins and the Militiaman has employment?—There is a considerable portion of the population of the United Kingdom that is permanently without employment. There was a Council of Trades Union delegates, who were interviewed on the subject of the food supply of the United Kingdom, and they stated, I was told, that they, out of their funds, have to pay an average of 100,000 men out of employment; that is the annual average; and they also stated that as the reason why they restricted the output in their several trades, because if they did not they would have a larger number of men to support. Well, if there are 100,000 men permanently out of employment in the United Kingdom, I see no reason why we should not get a few of them.

18253. That is recruits for the Regular Army. That is a different question from sending the Militia out?—But we get our recruits for the Regular Army and for the Militia, and in addition to that we have 100,000 men out of work.

18254. But putting the men out of employment into the Militia would not give them food all the year round?—Personally, of course, I should be in favour of compulsory Militia service.

Lieut.-
General Sir
W. G.
Nicholson,
K.C.B., R.E.

12 Mar. 1903.

18255. For how long?—I would have them out for a year. I would train them for a year. That would give them food, and so on. I would have three years' service. In the first year, the whole of the time they should be accommodated in barracks, and be fed, and so on, and get some small amount of pay. Then the next year a month, and the third year a month. Then they should go into the Reserve for five years, and be called out for training just like the Volunteers are.

18256. Would you take them by ballot, or would you have the whole nation trained in that way?—I would take them by ballot, because if we took the whole nation in that way we should get such an enormous number that we should not know what to do with them. I should enforce the ballot without substitutes, and take 70,000 men. That for the three years would give 200,000 men, and for the five years would give about 500,000 men.

18257. If they all went abroad?—If they all went abroad.

18258. Would you make it compulsory for them to go abroad?—I would make them liable to go abroad in time of war, just as every foreign nation does.

18259. In time of national emergency?—In time of national emergency, but not otherwise.

18260. (*Viscount Esher.*) Would that enable you to reduce your Regular Army?—I do not think very much.

18261. You would leave the numbers very much as they are now?—Very much as they are now.

18262. Do you think it would interfere with recruiting for the Regular Army?—No, I think the effect of this ballot without substitutes would be advantageous all round. It would make everybody more anxious to enter the Regular Army, or the Imperial Yeomanry, or the Volunteers, because they would then be exempt from ballot.

18263. (*Sir George Taubman-Goldie.*) We have had evidence from experts of high authority that while a year would be necessary for a certain number of men, those of more intelligence could be passed through military training in six months; would you think so?—That might be so; but the advantage of the ballot applied without any respect of persons is that not only the lower classes are got, but the higher classes as well, and these men, according to their intelligence and position, are turned into non-commissioned officers and into officers. One of our great difficulties is the want of a reserve of officers. This ballot system would give us officers who would be trained at any rate for a year, and would no doubt continue in the Militia afterwards, and would produce a reserve. Besides that, it would give us men of better education, so that they might become non-commissioned officers.

18264. Why do you think you could not deal with the 350,000 men physically sound who annually come to the age of 17 or 18?—No doubt they could be dealt with, but we should find it a difficult thing to provide them with accommodation.

18265. Could not billeting be used a good deal?—It is very unpopular; 10d., is it for meal, vinegar, and salt, and so on?

18266. In that way you would not require compulsory service at all for abroad, because out of the large number who had had military education there would always be a sufficient number who would volunteer for service abroad. The only difference would be that, say, in the case of the South African War we should have had trained men volunteering to go out instead of untrained men?—That is so; but it is difficult to make plans for military operations if we are to rely upon Volunteers. It is very much more convenient—I do not say it is absolutely necessary—if we know exactly what force we have at our disposal. A force dependent upon volunteering would be a very varying force. If the war was an unpopular war it is possible that nobody might come forward.

18267. For how long do you say you would make the liability of the Militia to serve abroad last, how many years?—Only in the event of war.

18268. But for how many years?—This is a scheme I roughly worked out: Three years with the colours, so to speak, one year of complete training, two years one month each, and then five years in the Reserve.

18269. So that their liability would extend over eight years?—I chiefly fixed those dates to get the force I consider would meet our military requirements.

18270. (*Viscount Esher.*) That would give you the 200,000 men you mentioned?—Yes.

18271. If I understand you, you say you practically want 80,000 men more than you have got?—Yes; but that is the minimum. I should like to have many more.

18272. (*Chairman.*) As regards the Militia, you will have an opportunity of giving evidence before another Royal Commission before long?—Yes, I see. But the difficulty I find in compulsory service is that there is no system of registration in this country of the habitat of the individual.

18273. (*Sir George Taubman-Goldie.*) But if you take him fairly young you get him before his School Board address is lost; you get that up to 14 or 15 years of age?—Yes.

18274. (*Viscount Esher.*) At what age do you propose to take your Militia?—I have not gone into the question of age at all.

18275. (*Chairman.*) That is more applicable perhaps to the other inquiry under the circumstances, because, since the other Royal Commission has been announced, we do not probably propose to go so deeply into the question; but supposing that you could not carry out a scheme such as you have been sketching, you would have to fall back, I suppose, in the event of war, upon having something like the expedients that we had to employ in this last war?—Yes.

18276. And enlist Volunteers for the various corps?—Yes, that would be the case.

18277. Has anything been formulated in the War Office, founded on the experience of the late war, to enable that organisation to be put into rapid and effective operation?—Not that I am aware of.

18278. Would not that be a natural step to take?—Yes, I think so.

18279. Would it not come under your department?—It would come under my department, but hitherto I have received no decision on any of the numerous points raised, so that further action has hardly been possible.

18280. We have had a good many witnesses before us who have been concerned in these various organisations, and we have often asked them whether they have ever been invited to give the result of their experience, and we have, I am bound to say, not found many affirmative answers. Would not that be a natural step to take in the War Office?—That is so. I may say that in one case I proposed that the question of the Colonial forces used in South Africa, their organisation, equipment, and so on, should be considered, and a scheme drawn up for future use, but owing to financial objections the proposal was negatived.

18281. Would there be much financial difficulty in simply drawing up a scheme?—It would involve the employment of a capable officer for about six months, I suppose.

18282. (*Sir George Taubman-Goldie.*) And any large staff with him?—No, no staff.

18283. (*Sir John Jackson.*) It would not cost a thousand pounds?—It would cost much less than that.

18284. (*Chairman.*) Still, I suppose a good deal of the difficulty that arose at the time, and of the criticisms that have been made of the organisations of various kinds, arose simply from the fact that there was nothing to guide those who undertook the work?—I think so; but whether they could have done better—whether, for instance, the Yeomanry Committee could have done better than they did, I cannot say; it is very difficult to say. They were doing things in a great hurry, but if they had had regulations or a record of past experience no doubt they might have done better.

18285. (*Sir George Taubman-Goldie.*) It was not only a question of the Yeomanry, but with regard to the South African Colonial Corps and with regard to Volunteer contingents, and so on; if there had been something to put before them, past experience to go upon, surely they could have done better?—I am sure they could have done better.

18286. (*Chairman.*) Do you think there is any prospect of your department taking that matter in hand?—I should be delighted to take it up if I could only get any increase of staff, but at present we are exactly *in statu quo*, and my work has very much increased with the creation of a Committee of Imperial Defence, while my staff remains the same.

18287. Your staff remains the same as when you last came before us?—Yes.

18288. (*Viscount Esher.*) I thought Mr. Brodrick

Lieut.-
General Sir
W. G.
Nicholson,
K.C.B., R.E.
12 Mar. 1903.

said the other night that he had given you an additional staff?—A reference to the Estimates published just lately would show that there has been a decrease in the amount allowed for my department to the extent of £300 for next year. This, of course, is not really a decrease, because the Permit Office, which is under me, and cost a thousand pounds a year, has come to an end, so that I have a net increase of £700.

18289. And what will that provide you with as regards numbers in addition?—It will provide me with no additional numbers. What has happened is this. When I put forward my proposals at the end of 1901 they were warmly supported by the Commander-in-Chief and the Secretary of State. Then the Chancellor of the Exchequer would not listen to them. Then I brought them forward again with some slight additions about last October, and again the Commander-in-Chief strongly supported them, but they were referred to a committee consisting of Lord Hardwicke as president, Mr. Chalmers, of the Treasury, the Accountant-General, and a retired officer of Engineers, Major Darwen, and this committee began its sittings, I think, in October, and I do not know what they are doing now. The report is not ready.

18290. (Chairman.) Is that a War Office committee?—An inter-departmental committee at the War Office.

18291. Is the Treasury represented?—Yes, by Mr. Chalmers, of the Treasury, but from what I can learn their conclusions will be such that I shall be quite unable to accept them.

18292. (Lord Strathcona and Mount Royal.) There have been many proposals which might have led to such an addition to the Army as you spoke of, formed somewhat on the lines that you recommend, and to provide 80,000 men more?—Yes.

18293. That is your own view?—Yes.

18294. (Viscount Esher.) With reference to what the Chairman was asking you, have you contemplated, if we were to embark upon a war with a first-rate European Power, adopting the methods which were adopted in the late war for the employment of Colonial forces, Volunteers, and so on, or has the whole trend of your mind been in another direction?—The trend of my mind is this, that I am very much in favour of knowing exactly what forces we have to rely on in war for military purposes in the event of war. On the other hand, I admit that owing to our insular position we may have two or three months—it is not an immediate matter of mobilising very large forces, because we may have a month or two months or three months' time for training purposes. Therefore, I have quite an open mind. I have simply put down the requirements. How the requirements are to be met, whether by compulsory Militia service or by a better organisation of the existing Militia or Volunteers, I have a perfectly open mind. But, if I might explain, I put forward my proposals for the military needs of the Empire, but I have never had any decision about them, and it is no good my going into the question of how this large force is to be raised until I have ascertained from the Government that they accept the conclusions put forward.

18295. That is, of course, one of the points you imagine that the Defence Committee are going to settle?—I hope they are going to settle it.

18296. (Chairman.) This is the reference we have in our mind to the Secretary of State's statement in the House of Commons. Perhaps you will just explain it, because I do not quite understand it. Speaking of comparing the Intelligence Staff of the German Army, he says: "Our Headquarters Intelligence Staff must be taken in connection with those who are employed in districts, and it must not be forgotten that this Empire has to keep three staffs. These are a British Intelligence Staff, an Indian Intelligence Staff (military), and a Naval Intelligence Staff. The expenditure on these three staffs taken together must be regarded as the amount which the Empire gives to military intelligence. I can only say this, it is perfectly true that the additional amount put down in the Estimates for intelligence this year is only a sum of £3,000, but that is by no means the measure of what has been done. I confess to the House that I had not been able to frame the total in connection with the Intelligence Staff before the Estimates." That Intelligence Staff, as I understand it, is not the Intelligence Division—not your department at all?—I do not know at all what the Secretary of State meant by saying £3,000.

I looked with anticipation to the Estimates, and was surprised to find that there is £300 less.

18297. Instead of £3,000 more?—Instead of £3,000 more.

18298. What does it mean by the British Intelligence Staff? What does he mean by that? He does not mean your department?—Yes, I suppose he does. Naval Intelligence, of course, is distinct.

18299. (Sir Frederick Darley.) There may have been an additional sum for Naval Intelligence?—But that would not be under discussion.

18300. (Viscount Esher.) But you see you are so near the end of the financial year that if there had been any question of increasing your staff you would have been warned by now, would you not?—I might have been. But the Treasury can sanction it, I suppose, after the Estimates are out.

18301. But you have seen the draft Estimates?—They are published, but even if they had been passed I fancy the Treasury could subsequently sanction an increase.

18302. Yes, they can?—I think they are relying upon that.

18303. (Lord Strathcona and Mount Royal.) Your opinion. I say it is most inconvenient and imprudent to be raised there should be no question as to the men being under obligation to serve in time of war?—That is my opinion. I say it is most inconvenient and imprudent to trust to volunteering in war time entirely.

18304. It is not safe to trust to volunteering?—No.

18305. (Sir John Edge.) Volunteering for foreign service do you mean?—Yes. I am speaking of a force for reinforcements or for expeditionary action abroad.

18306. (Sir George Taubman-Goldie.) But, as a matter of fact, do you not think we should be quite safe if the whole nation were trained to arms by degrees, and that we could depend positively upon having a sufficient number of trained Volunteers coming forward if the nation were properly trained to arms year after year?—I should say it is exceedingly probable, but I would not, on the other hand, reduce, and you cannot reduce the Regular Army.

18307. I am not suggesting that?—It would certainly be a very great advantage to have them trained in that way.

18308. (Chairman.) In fact, you think the three Army Corps is the minimum of the Regular Army?—It is the minimum, yes.

18309. Is there any other point you wish to speak to?—No.

18310. (Sir Frederick Darley.) Are there three Army Corps at the present moment ready for immediate service?—No.

18311. Are there two?—I should say about one and a-half is ready. It is not so much the men that are not ready, because in the course of next month I fancy they will be almost up to strength, at least the units will be up to strength, because the Army is in excess of the establishment; but there are certain things which have not yet been fully completed, such as transport arrangements and the vehicles, and harness, and the arrangements for horses, and so on.

18312. How soon may the nation anticipate that there will be three Army Corps ready for immediate service?—I should imagine by the end of six months.

18313. There is one other matter I would like to ask you about, in reference to transport; must there not always be necessarily a certain amount of regimental transport, for instance, transport for the entrenching tools?—Certainly, that is called the first line, that is always regimental, water carts, ammunition, and entrenching tools.

18314. Carts for carrying the men's haversacks on the march?—No, men always carry their haversacks, but transport for carrying the men's greatcoats, blankets, etc., cannot well be put into the first line. If they do not carry them themselves they come up on the second line transport, but the first line transport are entrenching tools, ammunition, and water carts.

18315. Do you not think they might have sufficient transport in the first line to carry their haversacks also?—It would add very largely to transport of the Army, besides which, haversacks contain rations, and must be carried on the person. As it is, carrying their great

coats and things they formerly carried themselves, has added per regiment, I think, two general service wagons, and all these things add up enormously; you get such a long transport train that it can hardly move.

18316. But would it not make the infantry regiment more mobile, and able to march better if the man had not to carry besides his ammunition his haversack?—Yes, it does; it makes the unit more mobile, but it makes the force less so, because the moment you increase transport, vehicles or animals, beyond a certain extent they block up along the roads, and they move so slowly.

(After a short adjournment.)

Lieutenant-Colonel H. G. MORGAN, C.B., D.S.O., called and examined.

18320. (Chairman.) At what time did you go to South Africa?—I went out on the 1st July, 1899.

18321. Before the beginning of the war?—Yes.

18322. In what capacity?—I went out as Deputy Assistant Adjutant-General, Natal.

18323. As part of the regular staff there?—Yes. I had been in Egypt, and I went on direct from Egypt to South Africa.

18324. After that, at the outbreak of the war, what position did you occupy?—I still occupied the same position. I did all the disembarkation of the Indian troops and the Indian Contingent. I made arrangements as far as I possibly could for supplies, and other things, contracts and supplies in anticipation of the war, and then, when Sir George White arrived, Sir Edward Ward came with him, and he took over the position of Director of Supplies, and I was made his assistant.

18325. Were you with Sir George after that?—No, I was at Maritzburg, and Sir George was at Ladysmith, but I was acting under his orders until Ladysmith was cut off.

18326. But you were not in Ladysmith?—No, I just got out.

18327. After that?—After that I still held the position of Assistant-Director of Supplies, and I was afterwards made Director of Supplies for Natal. I was Director of Supplies for Natal, with Sir Redvers Buller, all the time he was there, and when Lord Roberts came home Sir Edward Ward came home with him, and I was made Director of Supplies for the whole Army. I was Director of Supplies with Lord Kitchener until the end, and I came home in November last.

18328. You were at Pretoria eventually?—Yes.

18329. You have been good enough to give us some notes about the sufficiency of supplies and the quality of supplies; will you just put that in?—Yes. I have nothing to add to it.

Sufficiency of Supply in the Field.

Except at the commencement of the war, supplies were at all times sufficient.

Ladysmith suffered through this lack of supplies, and it was only through energetic action, and our being able to make large local purchases, that that town was provisioned as well as it was.

With this exception, the supplies available were always ample for all purposes. Transport from the coast and in the field was always very limited, but at no time was the Natal Force, and seldom during my experience the whole Army, ever on short rations of anything.

The method of supply was admirable, and leaves little to be desired. It may have been costly at first, owing to the fact that those holding the class of goods required knew we must have them, and put up the price accordingly. No sound previous provision can possibly avoid such being the case in the first stages of a war of this magnitude, as the majority of the supplies required are of a very perishable nature, which precludes stocking them to larger extent than will admit of their being turned over by consumption sufficiently rapidly to avoid deterioration. Many articles of supply in time of war are not an issue in time of peace, and consequently stocks of these cannot be kept at all. To do so would entail wastage, and it is far cheaper to buy when the demand is established, even at high prices at first.

Too much credit cannot, I think, be given to the

18317. (Viscount Esher.) There is one thing I wanted to ask you. Have you sat on the Defence Committee of the Cabinet yet under this new arrangement?—We sit every week.

18318. If you remember, on the last occasion, when you were before the Commission I do not think you had ever met that body?—No, we only met some time in January; that was the first meeting, I think.

18319. You had never been called before the old Defence Committee of the Cabinet?—No.

Lieut.-General Sir W. G. Nicholson, K.C.B., R.E.

12 Mar. 1903.

Director of Contracts, and all concerned at the War Office, for the really admirable way in which all demands from the seat of operations were met.

The method of receiving and distributing supplies in South Africa to the various depôts, and through them to the troops, was, I think, excellent, both as regards theory and practice. No theory can be practised without modifications and improvements, and the war gave ample opportunities of this, with most satisfactory results.

The greatest difficulty the Army Service Corps had to face was its want of sufficient personnel, both officers and men. As a consequence, all ranks had to perform more than four times the work they could be expected to do efficiently, and proper and efficient accounting had to be subordinated to the more pressing duties of forwarding and distribution to the troops. Fortunately, there was available in Natal and Cape Colony large, though not sufficiently large, numbers of business men, clerks, shop assistants, etc., refugees from the Orange River Colony and Transvaal, who came forward readily for employment with the Army Service Corps, and to this I attribute the success of the supply arrangements locally. Had we had to depend solely on the Army Service Corps personnel failure must have resulted, and even with the aid of civilians, who, though admirable material, required technical training, the strain on the Army Service Corps of all ranks was at all times, and especially at first, far too great, resulting in the early collapse of many of the best men.

To avoid this additional Army Service Corps must be provided by a large increase to its peace establishment, and I would further suggest the formation, not only at home, but in all our colonies, of auxiliary branches of the Corps on similar lines to Militia and Volunteers.

The Quality of Supplies.

The general quality was excellent. It is not to be expected that such large quantities as were required could be collected, all of a perfect nature; that there were few instances of bad, or at all inferior articles, says great things, both for those who collected them, and also for those who supplied them.

Failure or Delay on the Part of Contractors.

There was none of any moment on the part of local South African contractors, and to judge from the way in which supplies came to hand in compliance with our demands the contractors employed outside South Africa must have performed their duties well.

Other matters upon which I may be able to give information are:

1. The meat contracts.
2. The nature and quantities of the rations supplied to the troops, with suggestions for their alteration and improvement.
3. The provision and organisation of Field Canteens.
4. The collection, care, and management of captured stock, etc.
5. The requisitioning of supplies in the field, with suggested improvements.
6. The provision of a corps of unskilled labourers for the handling of supplies.
7. The necessity of making provision for the production of vegetables, milk, eggs, etc., both on lines of communications and at advance depôts.

Lieut.-Colonel H. C. Morgan, C.B., D.S.O.

12 Mar. 1903.

Lieut.-
Colonel H. C.
Morgan,
C.B., D.S.O.
12 Mar. 1903.

8. The provision of a Field Detective Department, as a part of the supply establishment.

9. The general system of supply accounting, with illustrations of variations adopted, with reasons for, and advantages claimed in favour of their permanent adoption.

10. The issue of rations, etc., on repayment to newspaper correspondents, with suggestions.

11. The necessity of placing the administration of both supply and transport in the field, under one head.

12. A comparison of the English and Indian methods of supply.

18330. With regard to the period before the war, what were you occupied in doing at that time?—General B duties; the B staff duties of the Natal command; as far as I possibly could I was trying to make myself acquainted with the country, and also with the various contracts that existed, and I made a few small contracts that I thought might be useful in the event of war; for instance, I made some contracts for various stations on the line between Maritzburg and Ladysmith in case troops had to march, contracts for their supplies at the various stations at which they were likely to stop, and the ordinary yearly contracts also came under my supervision.

18331. That is to say, based on the number of troops then in the colony?—That is so.

18332. But not in any way in preparation for a larger force?—No, I had no instructions to that effect, no more had General Penn Symons, who was then in command, and under whose orders I was acting.

18333. At what date did you get any instructions to prepare for a larger number of troops?—We got instructions that the Indian contingent were to arrive early in October, and we also got instructions that they would bring with them three months' supplies for themselves of everything, which they did, but it was not a full three months' supply, and as they arrived that was all sent up to Ladysmith with them. They all disembarked at Durban, and were entrained up to Ladysmith as fast as they could go.

18334. Before that time what was there in Ladysmith?—Practically nothing.

18335. Was there no store of supplies in Ladysmith before that time?—Not before then; everything was done under contract, and we simply drew from the contractors as we required it from day to day. There was no store of supplies at Ladysmith.

18336. And nothing began to be put into Ladysmith until the beginning of October?—Nothing; the stores arriving with the Indian contingent were the first real Army stores that were sent up to Ladysmith. When Sir George White arrived he instructed me to purchase as much as I possibly could, and I did so, and we sent it into Ladysmith as fast as ever we could pump it in by the railway. Of course a lot of it which was purchased did not get into Ladysmith, but was cut off.

18337. I think certain schemes of defence which we have seen provided that there should be sixty days' supplies for the garrisons intended to hold Ladysmith and Dundee; those supplies were not in position before war was declared?—Certainly not; the only thing I know of was that at all foreign stations we kept a certain reserve of 30 days' supply of preserved meat, biscuits, and groceries, and those reserves for the actual garrison of Natal were in their various places with the troops, but beyond that there was nothing.

18338. Thirty days for the actual garrison?—Yes.

18339. There was a garrison in Ladysmith?—Yes, and there would be 30 days' preserved meat and biscuits for them at Ladysmith. I think I am right in saying that there were two battalions of infantry, a cavalry regiment, and two batteries of artillery, as far as my memory goes.

18340. But only 30 days' supply?—Thirty days' supply for that force.

18341. Was there no provision for further supplies being thrown in except what the Indian contingent brought with it, until you began to make contracts?—None, until we began to make special purchases; supplies were on the way from England, but they had not arrived, nor were they likely to arrive for some little time.

18342. Did they not arrive before the siege commenced?—No.

18343. Nothing arrived from England?—Nothing.

18344. All the supplies that were thrown into Ladysmith you had to arrange for on the spot?—Except what came with the Indian contingent.

18345. Would you tell us what steps you had to take in order to get the amount of supplies that were put into Ladysmith?—I had to purchase everything I could find in the colony that was suitable, and I had a good deal of difficulty at first, because the merchants all made a ring against me, and put up prices, and I found that directly I advertised for supplies in certain quantities they made a ring, and put up the prices, and I only got one tender. I broke that by not letting them know when I wanted certain things, and by writing out the requirements myself, and posting them to all the tradesmen I knew of who were likely to have them. I posted them to them myself, so as to keep them out of my clerks' hands, and gave them only 24 hours in which to give me replies as to what they had in their hands and the prices, and in that way they had not time to corner, and we got things at a very fair price. I think taking it all round we did not pay excessive prices.

18346. (Sir John Jackson.) That was before martial law was declared?—Yes.

18347. (Chairman.) You mention meat contracts here; was that included in that period?—Of course I had to make the meat contract for the Army in Natal, and that was made just after Sir George White arrived. We advertised for tenders, and did not get a single reply. I then had to send for those who I thought could possibly carry out the contract, and we were practically at their mercy. We were not in a position to carry out the contract ourselves, because we had not sufficient personnel, and we were practically at their mercy, but we managed to make a contract after a good deal of trouble at 9d. a lb. for fresh meat, and 7d. a lb. for frozen meat.

18348. (Sir John Jackson.) Who was the contract made with?—With Thomson and Son, of Natal.

18349. Had you any dealings with Mr. Weil?—No. Afterwards the second meat contract with the South African Cold Storage was made by me practically under Lord Kitchener's instructions, and as to the last contract with the Imperial Cold Storage, I came home for the purpose of that contract.

18350. (Chairman.) As you are mentioning them, would you give us the details of those contracts?—Of course, when the first contract was made I knew nothing about the making of that contract. The prices were undoubtedly high, but I do not think under the circumstances they were excessive. The contractors knew nothing of what they had to face, there was no one there except them to make the contract, and we were practically at their mercy, because we could not have carried out the contract ourselves, and we had to pay some one to do it.

18351. You are talking of the contract made by Colonel Richardson?—Yes, and the prices were high undoubtedly; but the difficulty would have been to find anyone to do it for less, because they were facing the unknown entirely. As to the next contract, nobody could be found to take it up, and I believe I am right in saying that it had been recommended to the War Office that the old contract should be extended for another twelve months.

18352. May I ask at what time?—That was after the first twelve months.

18353. Could you give us the date?—From the 17th February, 1901.

18354. The first contract was for 1899-00?—Yes, up to the 17th February, 1901, and it was recommended to the War Office that the same contract should be extended from the 17th February, 1901, to the 1st April, 1902.

18355. (Sir John Jackson.) Was that the 8d. and 9d. a lb. contract?—That was the 11d. and 9d. a lb. contract.

18356. What did they do for that? Was this for Australian meat?—The 11d. was for fresh meat, which would naturally be local meat.

18357. Where did they deliver that?—Anywhere we asked for it.

18358. Anywhere in the colony?—Anywhere, with the columns in the field, everywhere.

18359. What did they get for the Australian?—For

frozen meat they got 9d., which they had to deliver anywhere.

18360. (*Chairman.*) You are speaking of the first contract?—That is the first contract; the second contract was for 10d. and 7d. a lb.

18361. (*Sir John Jackson.*) That would be approximately about double, more or less, what they would get in ordinary times for the meat?—Oh, no, it would not be double.

18362. At the present time for the meat delivered in any of those South African ports is it not the fact that it is usually done about 3d. or 4d.?—Yes, but then there is storage after it arrives.

18363. I quite understand that, but in consideration of the extra cost that they had in delivering it wherever you wanted it, and so forth, the price was enhanced about cent. per cent.?—Yes, taking all risks it would be about that.

18364. (*Chairman.*) The second contract was for what did you say?—10d. and 7d., 10d. fresh and 7d. frozen.

18365. And that was concluded by you?—Yes.

18366. And that continued during what period?—From the 17th February, 1901, to the 31st March, 1902.

18367. And then after that?—The next contract was for 9d. and 5d., and that was from the 1st of April, 1902, to the 1st April, 1903—that contract is still running.

18368. These contracts you are speaking of are all Cold Storage Company contracts?—Yes. I see from my papers that the last contract was for frozen meat 45s. 8d. per 100lbs., and fresh meat 70s. 6d. per 100lbs.

18369. With regard to those contracts, you say as to the first that the prices were high, but you think they were not unreasonable considering the circumstances?—No. I think if I put myself in the place of the contractor I should have been afraid to go into it as a contractor unless I was quite sure I was going to come out of it all right. It was a speculation, and the South African can hardly be called a speculator; he likes to make sure of his ground, and to make sure that he is coming out on the right side. He was taking it up practically as a favour to us almost, you might say, and I think he was right to put up the price. I think it was a mistake to make the contract for 12 months.

18370. It might have been made for a shorter period?—Yes, until they saw how things were working.

18371. And that means to say that you might have got the reduction of price in the second contract a little sooner?—I think we might. I was very much afraid we would not even when the second contract was made, and it was purely by bluff that we got it.

18372. Even then the circumstances were risky for the contractor?—Very risky; in fact, the contractor knew then that he could ask what price he liked; he knew what he could do it for, but naturally he wanted to make all he could out of it.

18373. At the time the third contract came the circumstances were somewhat changed?—By that time we had been able to make arrangements to carry out the contract ourselves in case we did not get a sufficiently satisfactory contractor; we were quite prepared for that. I had made all arrangements in South Africa to do that if necessary, and I had also been able to bring several large firms together, and there was likely to be more than one tender, and as I thought it would be better done at home, Lord Kitchener sent me home for that purpose. I came home, and I tried to get as many as I could to combine and tender for the contract, with the result that we had a very fair lot of tenders sent in. We calculated that we had tenders for everything; we had tenders for meat delivered at the coast c.i.f. f.o.b. at the various ports, and also for delivery on rail and delivery at various centres in South Africa. We had tenders for every possible thing we could get, and when we got the tenders in we made a very careful calculation, and we found that had we taken tenders c.i.f. the cost to us of landing and storing, railing and distribution to the troops would have come to exactly the same as the price at which one firm tendered to supply us entirely themselves, delivering for us to the troops, so that naturally we accepted their tender rather than do it ourselves when we could get it done at the same cost, because it meant a certain amount of personnel being taken away from supply work, which we could not afford to take away, unless there was very ample reason for doing it.

18374. That was the most economical way at that time?—It was; at first we could not have done it ourselves, as we had not the organisation to do it.

18375. In the first case, although it may not have been an economical arrangement, looking at it from the purely money point of view, it was the only practicable way open to you?—Yes. I think where the contractors were a little bit grasping was that they insisted on getting captured stock at 2d. a lb. estimated dead weight less than they were paid for it when they issued it to the troops at so much per lb. dead weight. On the Natal side, under the contract we had there, any captured stock we got we handed over to the contractor at so much dead weight, and they issued it to us again. They killed it, dressed it, and issued it to the troops, and they only got paid for the actual amount, and they paid us for the actual amount, so that all they got out of it was the offal and the hides; they got nothing in the way of money; they got the offal and the hides, which were no value to us.

18376. (*Sir John Jackson.*) They were charged at the same rate?—Exactly; we charged them at the same rate as they delivered to us; they killed it, dressed it, and delivered it to the troops.

18377. In consideration of getting the offal and the hides?—Yes.

18378. (*Chairman.*) Do you think that was sufficient? They were quite satisfied.

18379. I think, speaking from recollection, what we were told was that they had a certain amount of risk as they had to keep the captured cattle?—Yes. Of course, that was quite right; but in Natal we kept it, and handed it over to them for slaughter.

18380. So that when under the other circumstances it was handed over to them to keep, perhaps the twopence was not so unreasonable?—It was not, except that they got, under the conditions of their contract, compensated for any stock captured by the enemy, and their only loss was through disease.

18381. (*Sir Frederick Darley.*) Did the offal include the internal fat?—There was practically no internal fat in those cattle, they were too lean; in fact the meat was hardly fit for issue.

18382. They did not make tallow?—They had no means of transport; it was all buried. The only thing they really got from it was the hide, the head and the tail, and things of that sort they used to sell to the Kaffirs and the men.

18383. They had the tongue, I suppose?—Yes. I do not suppose that the value of the offal was more than at the outside 3s. 6d. or 4s.

18384. But the hide would be worth about £1?—No, the hides were very much damaged; they had to kill them in the field, and they were very roughly killed and very roughly skinned. I do not think the hide was at the outside worth more than half-a-crown; in fact, you could not have sold it for half-a-crown.

18385. (*Chairman.*) They would have difficulty in removing them?—Great difficulty; the hides were so valueless that we used to have to pay to get dead animals taken away. Usually you can get paid for having them taken away.

18386. Those are the main facts about the meat contracts?—Those are the main facts about the meat contracts.

18387. Taking them as a whole, looking back upon them, you do not think there was anything exorbitant about their terms?—I do not think although we had to do it over again we could improve upon them.

18388. (*Sir Frederick Darley.*) How did the prices compare with the ruling prices then, the butchers' prices in Maritzberg, for instance?—The prices of the contract we made were practically, if my memory is correct, about a halfpenny a pound more than the existing contract for the supply of the troops in Natal.

18389. At the Cape it was one penny a pound less than the ruling butchers' prices?—It would be, than the ordinary retail butcher's prices.

18390. (*Chairman.*) And the meat was of good quality as it was delivered?—Oh, yes, it was very fair quality; we had no trouble with the contracts, and they were very well carried out indeed.

18391. And the frozen meat?—The frozen meat was excellent.

18392. Of course, it could only reach those portions.

*Lieut.-

of the forces which were within reach of the dépôt?—Yes, we would not take frozen meat to any place more than three miles away from the railway line.

18393. But, subject to that limitation, it was a good supply?—Very good indeed—excellent.

18394. I suppose this is the first time it has been used for a force in the field on that scale?—I should say it was the first time it has ever been used. The Americans used it in the Philippines.

18395. And you think it was a satisfactory experiment?—I think decidedly; I think it is much preferable to fresh meat.

18396. The fresh meat being hard?—It was generally of bad quality, because it was the trek ox practically or the old cow, and it was of bad quality—hard and stringy.

18397. (*Sir Frederick Darley.*) Where did your frozen meat come from?—I think principally from the Argentine. Of course, the Australians wanted to get more money than they ought to have asked, and directly we tried to buy from them up went the price.

18398. (*Chairman.*) You are prepared to say something about the nature and quantity of the rations?—Yes, I do not think there is very much there. I think the nature of the rations was excellent, and the quantity was quite sufficient, in some cases a little bit too much—for instance, for biscuit it gave the troops a pound a day, or a pound and a quarter of bread; now they could not eat the biscuit; no man living could eat a pound of that hard biscuit. A pound of that biscuit is six of those square biscuits, and there is not a man living who could eat it.

18399. What did they do with it then?—It was wasted.

18400. They threw it away?—Yes, it was thrown away. I can give you an instance. In Egypt in 1896 I was up the Nile in charge of the supply of a regiment, and on leaving our base Lord Kitchener told me he wished to take 30 days' supply, and he could only give me certain accommodation on the river in barges to take it up. I calculated it up, and I found I had either to leave some of the supplies behind, or I would have to leave the forage for the mules I had behind altogether, as I had not transport to take it all up. I decided that it would be better to leave the forage behind than to leave behind the men's supplies, which I did. I had 87 mules, and I fed those 87 mules entirely on the biscuit that was thrown away by the one infantry regiment, and they came back quite fat.

18401. (*Sir Frederick Darley.*) On the waste biscuit?—Yes, and I think that if we gave the men, say, 2 ounces of Quaker oats or rolled oats in lieu of the extra biscuit and some more sugar and cocoa, we would do them better. I should give them the powdered cocoa, such as Epps', and those sort of things, instead of the hard rock cocoa, which is no use to them. The powdered cocoa is very useful in the early morning, and so are the Quaker and rolled oats, because the men put it in their haversack loose, and they can pull it out with their hands and eat it as they march along. They like it immensely, and it would be far better to have some of that and less of the biscuit.

18402. (*Sir John Jackson.*) Where does the need for the sugar come in?—They want the extra sugar if you give them the extra tea or cocoa.

18403. They must have it sweetened?—Yes. Tommy will not have it unless it is sweetened; he is always crying for more tea, coffee, and sugar, and I think if we gave them cocoa instead of the tea it would be better for them. With regard to the rum ration, I think it would be better if we only gave the rum ration as a regular pick-me-up under the General's orders absolutely; there should be no rum ration at all unless ordered by the General as a pick-me-up after a very long march in wet weather, and a better pick-me-up for the troops would be an issue of Liebig or Bovril, or something of that sort, after a long march. The troops in blockhouses ought never to get rum, as they get the issue and they drink it all at once, and the result is that half of them are drunk.

18404. (*Chairman.*) Do they get an issue of rum now?—They get in the field an issue of rum three times a week, or every day if the General orders it, and it is not a good thing for them. That is all I wish to say with regard to that part of the subject.

18405. We have had some evidence about tinned meat to the effect that there was some difficulty in

the provision of tinned meat in 2lb. tins?—That is a long question. For a long time the home authorities would not see the advantage of having 1lb. or 2lb. tins. They said that the cost was greater, and that it did not keep as well, and that it was not as good, and undoubtedly it is not so good in the smaller tins as in the larger tins.

18406. (*Sir John Jackson.*) The larger is the 6lb. tin?—Yes, but for years and years I think we have all pointed out that the 1lb. and 2lb. tins were the most advantageous for active service, and I do not think at first there was sufficient of it sent out. I managed to purchase a large quantity of 1lb. and 2lb. tins in Natal, and we did not feel the pinch of the want of it in Natal at all, because we had this large quantity, which was purchased really for Ladysmith, and was not got up there in time, so that really in Natal we had plenty of 1lb. and 2lb. tins.

18407. (*Chairman.*) We had some evidence from General Buller's force, I think, that they had these large tins, and as the soldiers could not of course eat the whole of one, the balance was thrown away?—I think that must have been after they joined hands with Lord Roberts' army, because there were plenty of 1lb. and 2lb. tins in Natal, and we always issued it, my instructions to supply officers being that they were always to issue it to small parties. I do not say that we had sufficient to issue it to everybody, but I think certainly 30 per cent. of the meat in Natal was in 1lb. and 2lb. tins.

18408. We also had evidence from the home authorities that the supply of 1lb. and 2lb. tins actually ran out, and they could not be got?—That I can quite believe, but, as I say, I was very lucky; the grocers and other people in Durban and Maritzburg stocked more of the 1lb. and 2lb. tins than of anything else. I bought up all their stocks, and I did not get any 6lb. tins in what I bought. I bought 300,000lbs.

18409. These were supplies you got locally?—Yes, and, of course, a small proportion of 2lb. tins came out with the Woolwich supplies, and with the two together, what I purchased and what came out, I think I am right in saying that about 30 per cent. of what we had was in 1lb. and 2lb. tins.

18410. But the trade at home would not have an unlimited supply of 1lb. and 2lb. tins?—Not to the quantity we wanted.

18411. They would naturally have it in the larger tins?—Yes, because it would be made for us in that tin, you see.

18412. For the general trade I suppose the larger tin is the one that is used, is it not?—That I could not tell you.

18413. It has been alleged that there was an accumulation of tinned meat in Natal which became an actual nuisance?—That is quite so; there was. We had very large stocks at all our base ports of tinned meat and biscuits, and it became a nuisance in this way, that we had no storage for it. It had to stand out in the open, and, of course, with the wind, weather, and sun acting upon anything of that sort one or two, at any rate, of the outside tins in each case would rust, and perforation was set up in that way, and that would go bad. If one tin in a case went bad with the thousands of cases that were all stacked there, you can imagine what the nuisance would be. It was not that it was all bad; we had it unpacked afterwards and picked over, and I think the average was only about half a tin per case that was found to be bad. That was due entirely to exposure.

18414. And exposure which could not be avoided?—It absolutely could not be avoided.

18415. What did you do with that?—It was taken out to sea and destroyed.

18416. And the nuisance prevented in that way?—That was the only way we could do it, and, of course, it took time; even if there is one tin bad in a big stack containing thousands of pounds of meat it makes sufficient stench to make you think that the whole stack is bad.

18417. So that the casual observer might think the whole was bad, whereas as a matter of fact it was not?—That is so. You can generally tell the bad boxes, because it runs and stains the wood, and we picked them out as far as possible.

18418. (*Sir Frederick Darley.*) When the meat was bad did not the top part of the tin bulge upwards con-

sequent upon the gas inside?—Yes. Of course we had to use boxes containing tins of biscuits and boxes containing tins of meat for dunnage too, and that was very disadvantageous. We stopped that in the end, but we could not get dunnage at first, and we did not want to put stores like flour, rice, tea and coffee right on the ground. It was very difficult to avoid everything undesirable, but of course one lives and learns, and we may do better next time.

18419. Your demands on the Home authorities were always met?—Extremely well.

18420. And you had sufficient supplies throughout?—Plenty; our difficulty was to get them up from the coast, and it was a great strain on the railway. During the last eighteen months of the war we required 350 ten-ton trucks a day from the various coast ports to keep the Army supplied, and, of course, that was not easy to do.

18421. (*Sir John Jackson.*) Was the difficulty with the congested state of the railway near the disembarkation ports?—I do not think the railways were congested, except that they were not capable, with one single line, and the rolling stock they had got, of dealing with the traffic; they did it well enough, considering.

18422. The rolling stock was short?—Yes, and, of course, it was not added to, but on the contrary kept on decreasing every day with accidents, trains being hung up and destroyed, and one thing and another.

18423. At Cape Town we were told that there was no room alongside the quays to get the ships unloaded?—It was very cramped directly we began to store supplies on the quays, and we could not get it away from the quays, because we had no means of taking it away.

18424. Were there ever any food supplies brought into Simonstown and taken on the railway from Simonstown?—They did land some stores at Simonstown on one occasion, and they were all brought back again to Cape Town.

18425. (*Chairman.*) You had a difficulty in the numbers of the Army Service Corps?—Yes, we were very much undermanned, in fact we had no officers at all considering the size of the Army; we could hardly find one Army Service Corps officer per brigade.

18426. What did you do?—We had to use anybody; the one Army Service Corps officer had to do supply and transport, and he had to get any one he could to help him, and it generally resulted in his having to do the work himself, as the officer or civilian he employed had to be taught the work. The civilians were the best, because they had a certain amount of commercial training, but they had to be taught, and the strain on our officers at first was something terrible.

18427. There were a certain number of special service officers employed on the work, were there not?—Some of our own officers came out in special service at first, but usually the special service officer was only an ordinary officer, who had no training in Army Service Corps work, and was no use for that sort of work at all; he had to be taught; he was a special service officer for anything, and when he got out there he was detailed to anything they liked to put him to. Beyond our own officers who came out as special service officers I do not remember any officers who came out as special service officers being put to supply duties or transport duties; they generally went to general staff duties.

18428. We heard of them being placed to transport duties at any rate?—That may have been on the Cape service, but at the beginning of the war I was in Natal entirely, and we were hardly in communication with the Cape.

18429. There you were able to get in civilians?—We got numbers of civilians, but they wanted training, of course; it was not until two or three months that they were much use to us. We were able to get on by allowing accounting for supplies, and that sort of thing, to be in abeyance until we could get time to do it, and pull it up.

18430. Of course the strain all round was very great in consequence of the size of the operations, but you think that the Army Service Corps peace establishment ought to be increased?—Certainly, I think it ought to be at least doubled.

18431. So as to provide for the contingency of another expedition of the same kind?—Certainly.

18432. I think you mentioned field canteens also?—Yes, I started a field canteen at the very commencement in Natal. My original idea was not so much a field canteen as a sales dépôt for Army stores, and the idea

first occurred to me in Egypt, because I found that up the Nile, and places of that sort officers and men could not get luxuries. They came howling round the supply officer, asking him to sell them hospital supplies, and things of that sort, which were luxuries to them. They had no money to pay for them, and it generally ended in their giving a small chit of paper for the value of the things they took. A young supply officer who was there got perhaps in one day £300 or £400 worth of these small chits; a storm would come and blow them away; he would say "I have lost £400 worth of chits"; he would lose his head, and the supplies would go to the bad altogether. In order to avoid that I thought it would be a good idea to bring in a sort of repayment branch of the Army Service Corps, where we would have men who would be prepared to take these chits and have no other responsibility besides, and where the men could go and buy the few extras they wanted in the field. From that it developed into field canteen. I got permission from Sir George White to start that sort of canteen, and I started it on my own credit, buying the stores from merchants at Durban on credit, agreeing as to the prices I was to pay them, and I agreed to pay them 5 per cent. over and above that for credit. As I sold the things I paid the cash over to the merchants, and eventually I got on until I found I could pay cash for everything, and then I bought in the open market, and paid cash for everything. Eventually we did very well. The idea was that any profits made by this canteen were to be given to the next-of-kin of the men killed in action or dying of wounds in the field, and the profits made by the Natal Army under Sir Redvers Buller amounted to very nearly £14,000, which was distributed to the next-of-kin of all men who died in the Natal Army; they got just £8 a piece. Then when we joined hands at Pretoria I was authorised to extend the system to the whole Army, which I did, and we extended it to the whole Army all over the country—Cape Colony, Orange River Colony, Transvaal, and everywhere. We had field canteens in the field; we made up our own transport to carry it, or hired transport for the purpose. We distributed to each regiment as it left the country a grant of £200 towards their regimental institutes when they started again in another country, and we made a distribution to the men who had lost an arm, say; they got a grant of £20, or something of that sort, and altogether, after the £14,000, we distributed in that way £88,000 in various directions, and when I left South Africa the canteen showed a balance credit of £470,000.

18433. (*Sir John Jackson.*) What was it proposed to do with the £470,000?—Just before I left South Africa they re-modelled the whole thing as the South African Garrison Institutes, and it was to be run as a civilian establishment. They were to run all canteens, both wet and dry, in the garrisons, and we allotted to them for that purpose £400,000 capital. They were to reduce the stock, for the stock was very large owing to the large demand being suddenly stopped, and as soon as the stock was reduced that £400,000 was to be reduced to £250,000, and that was to be their working capital on which they were to run the canteens. There was a plan drawn up of garrison institutes to be built. At Pretoria there was to be a very fine building indeed, which was very nearly finished before I left; it was to be of stone and brick, and to contain billiard rooms, reading rooms, writing rooms, supper rooms, and everything possible as a club house for the soldier.

18434. Under the new arrangement what becomes of the profits?—The profits go to pay for these buildings and also for their upkeep, and for the upkeep of the canteens, and the profits made afterwards in each district go to the General Officer of the District for distribution in such manner as he may think right, such as the upkeep of their recreation grounds, and so on. We also gave grants for the building of officers' club houses, and things of that sort.

18435. (*Chairman.*) Is that an entirely new system?—It had never been started before, and was an entirely new idea; it was marvellous the way it worked. I remember the time when I had a sleepless night because I bought 200 cases of whisky, as I did not think I would ever sell them. I happened to get the lot cheap, and I was afraid I would never sell them; but after that, towards the end, we were doing a turnover of over £4,000,000 a year.

18436. How does it differ from the ordinary canteen?—Because it is not regimental; it is run entirely by a civilian personnel.

18437. (*Sir Frederick Darley.*) Were these canteens

Lieut.-
Colonel H. C.
Morgan,

Lieut. Colonel H. C. Morgan, C.B., D.S.O.
12 Mar. 1903
—

you speak of large shops in which everything could be bought?—Everything.

18438. Clothing?—Everything. It was a regular sort of William Whiteley in the field. The only thing we did not sell was liquor; we sold liquor to officers and beer to the men when we could get at them, but they were only allowed a pint a day, and only when it was available, of course. The principal thing was really the groceries, the dry goods, and the clothing.

18439. (*Sir John Jackson.*) Where did you get the civilians from?—From the refugees.

18440. (*Sir Frederick Darley.*) That accounts for a notice I saw in connection with an auction sale the other day in which a whole quantity of ladies' dresses and so on were sold for the Government: would that be one of these canteens being sold out?—When first the burgher camps were formed they asked if I would establish canteens in the burgher camps for the Boer refugees, which I did, and, of course, for them I got women's underclothing and children's clothes, and everything possible, and it is very possible that some of these stocks may have been still left over, and were being sold by auction.

18441. (*Chairman.*) Is that an organisation which is peculiar to South Africa?—Yes, absolutely.

18442. It would not be one that would be continued elsewhere?—I think it could be extended to the whole Army. I would rather not say much about it, because it is my hobby; but I would like very much to see it extended to the whole Army. I am quite sure it is the system, as it has the advantage of doing away with the tenant system, because although you are practically a tenant, the canteen belongs to the soldier, and you do not want to make profits, any profit you do make going back to the soldier himself. You put in the very best article at the cheapest rate, and you have no object in putting in bad stuff. It is all very well in a canteen under the tenant system to say that the officers will see that a certain brand of an article is put in, but we all know that there are qualities and qualities of every brand, and the tenant, who wishes to make money out of it, will put in an inferior quality of the brand he is obliged to put in until he is found out, which is only after eight or nine months; and when he is found out, he says "Certainly," and puts in the other article; but he has made his profit, whereas with this system you have no tenant, the tenant is the soldier himself.

18443. How do you make this large amount of money out of it?—The way the money was made was in this way: our turnover was very, very considerable, and very quick. For instance, we would turn over our capital very nearly five times a month. The canteen was worked on this principle: the articles sold in the canteen were divided into three classes; there were the soldiers' necessities, which were sold at just under cost price; there was the soldiers' luxury, and the officers' necessity, which were sold at just a fraction over cost price; and then there was what we called the officers' luxury, such as whiskey and things of that sort, which were sold at 3 per cent profit. Then by registering ourselves as brokers in the four Colonies we bought in South Africa from the merchants direct, and did away with the brokers, and we claimed the 1 per cent. brokerage; that 1 per cent. brokerage on a turnover of practically £500,000 a month meant a very considerable profit, and that 1 per cent. brokerage and the 3 per cent. we made on the officers' luxuries paid all our expenses and gave us our profit.

18444. The next point you mention is captured stock?—That, of course, we had great difficulty with, and there ought to be some organisation in connection with some branch in the Army to take possession of captured stock in the field; for instance, in South Africa we were robbed of hundreds of thousands of pounds through not having a proper organisation of that sort till practically near the end. A column goes out on march and it captures, say, a lot of cattle, and any of these scallywags coming along, who are following the Army all over the place, will come up to the Commanding Officer and say: "I am a drover with this column; I will take your cattle and drive them for you." The Commanding Officer naturally thinks it very good of him, and says: "All right, give me a receipt for them," and he gives a receipt signed "Tom Jones," and goes off with the cattle to the nearest market and sells them. If there was some recognised organisation in the field and proper people with passes attached to the various columns to take over the cattle as they were captured, there would

not be those losses, and there would be some organisation which would properly look after them.

18445. Do you think the losses in that way were considerable?—Very considerable; it was done principally by local Colonial corps undoubtedly, who used to send a man out saying: "I am a drover"; they used to take them, and drive them off. They knew the country well, and they would secrete them somewhere until they could get them up into Rhodesia or somewhere or other. That occurred very considerably up in the Northern Transvaal, where they could get them across more easily to Rhodesia.

18446. It would not be so easy to dispose of them in the other parts, such as the Free State?—It would not have been hard, as they always had the contractors; the contractors' agents were in it as much as anybody else. I have got a form of pass which I had drawn up for the last contract to try and prevent that sort of thing. (*Exhibiting the same to the Chairman.*)

18447. (*Sir Frederick Darley.*) Are the cattle branded there?—We used to brand them as far as possible.

18448. Are they branded by the owners originally?—Oh, yes.

18449. Is there registration of brands?—No, they had no registration of brands. In Natal they had to a certain extent, and in Cape Colony also, but we could not discover any registration of brands in the Orange River Colony or Transvaal. The branding was our great difficulty; we branded, of course, all we got; we put them into depôts and branded them with the broad arrow, and then when we sold them to contractors they had the condemned mark put on them before they were issued to them.

18450. (*Chairman.*) Now as to the requisitioning of supplies?—I say the same thing with regard to the requisitioning of supplies, namely, that we wanted some organisation with columns, and the same organisation really that had the care of captured stock could very well do for the requisitioning of supplies. You see a column went out into the field, and they were collecting supplies in the country, and anybody going along who came across anything would give a receipt for it. There were no possible means of knowing what receipts had been given, or who had got them, or whether they were given to the legitimate people or not, and I think there was a good deal of abuse in connection with that, and a great many receipts that eventually came in were forgeries. I think we lost thousands of pounds through not having a proper organisation for requisitioning supplies. There ought to be so many officers per brigade; in fact, I would have two officers per regiment.

18451. Who was supposed to requisition—the Commanding Officer?—The Commanding Officer or someone deputed by him. A squadron of cavalry would arrive at one of the villages, and the commander of the squadron would tell off five or six sergeants to go round and collect everything they could lay their hands on. They would go round, and in some cases give receipts for what they got, and the prices put on in nine cases out of ten were exorbitant. The man going round had no idea of the value of the articles he gave the receipt for, and he would put on the price to be paid for them which was dictated by the Jew owner, and which was probably three times what it ought to have been. We had to abide by receipts given like that. We tried to beat down the prices as much as we could, and did to a great extent. In a great many cases bogus receipts were given, and there were many forgeries; heaps of receipts came before me that I knew were forgeries, and which I threw out as such. I think if we had an officer with a small staff for each small unit in the field, and let him do the requisitioning, no receipts to be signed without his keeping a record of them, there would be a record of all the receipts given in the field from day to day, and we could tell what our expenditure in the requisitioning of supplies was. As it is now we shall not know for three or four years.

18452. The matter is still under consideration?—They are still being paid as far as possible. In Natal I think General Buller's system was rather better; as the troops advanced officers went behind the troops paying for the things requisitioned; they went backwards and forwards in the country behind the troops paying requisitions. They made inquiries as to where the owner of these things was, if he was a man, and if he did not produce the receipt himself that receipt was torn up and thrown on to the veldt and not paid at all. If he pro-

duced the receipt himself it was taken as satisfactory evidence that he had not gone off to the enemy, and he was paid for it there and then. That was carried on for a long time, but Lord Kitchener's objection to that, and a very right objection, was that if he paid this money it meant that the man, having received his money, rejoined the enemy, and that it was better not to pay until the end of the war.

18453. It is very difficult to check things three or four years afterwards?—Yes, but it would be easier if a record was kept of every receipt given.

18454. You want a corps of unskilled labourers?—Yes, that we had, but we ought to have it formed immediately a war is thought of even. When stores come flowing into the country people have to be employed at the coast at exorbitant rates to off-load them, whereas if we had our own corps of unskilled labourers we would do it for next to nothing.

18455. But you employed natives?—Yes, I had a corps of unskilled labourers; in Lord Roberts' Army it was done by the Director of Railways; he got his natives for railway purposes, and he also supplied from his railway native labour corps the requirements of the Army, but that did not work very well.

18456. (Sir John Jackson.) What did they pay these natives?—£2 a month, to include all overtime.

18457. And you fed them?—Yes, on mealie; we gave them 3lbs. of mealie and ½ oz. of salt a day. When I ran the corps for the whole Army we had, I think I am right in saying, 14,000 natives employed as labourers in the whole of South Africa; that included herds, farm labourers, and everything else.

18458. As to the necessity of making provision for the production of vegetables, and so on?—I think that is very important, because at all times on active service the railway must be very hard pressed to get supplies of material up for the war, and the railways can be saved to an enormous extent if vegetables and other things can be supplied, particularly for the hospitals. It is absolutely essential that the hospitals should have fresh eggs and milk, and they can be produced undoubtedly on the lines of communication and at the base depôts.

18459. Do you mean that the vegetables should be grown?—Yes; take, for instance, potatoes, one truck of seed will produce eight trucks of potatoes, and see what that saves the railway. We made money out of it also. In the accounts the farms were debited with the cost of the seed and labour, rations, arms and ammunition, implements, tools, and all that sort of thing that they had for their use, and they were credited with the value of the supplies they produced and handed over for the use of the Army at the lowest price at which they could be obtained by contract at the various places—that is, their cost, we will say, at the nearest place where we could make a contract for them, plus the railway carriage to the place where they had to be delivered, and the balance at the credit of the military farms to the 31st of the third 1902 was £25,636 7s. 6d.

18460. (Sir Frederick Darley.) Was that more than one farm?—That was right through South Africa, about 70 farms. In addition to that we provided the troops on the lines of communication, especially blockhouse lines, with vegetable seeds free, and we had instructors going round to instruct them in gardening, and encouraged them to sow vegetables round their blockhouses for the provision of fresh vegetables to themselves, and that worked very well indeed.

18461. (Chairman.) Did the farms supply milk too?—Yes, all the hospitals were supplied with fresh milk from the farms; we collected the best cows from the captured stock and put them into the dairies.

18462. What has happened to those farms now?—They are all done away with; the majority of those farms belonged to Boers and various people who were on commando or refugees, and we paid no rent for them. We simply occupied the farms, but we improved them immensely, and as soon as the war was over we had to hand them over again.

18463. You were occupying the actual farm buildings that existed?—Yes.

18464. (Sir Frederick Darley.) I suppose you had a good season which produced that?—A fair season; I

would not call it an extraordinary season. There is no doubt about it that agriculture in South Africa would pay 40 per cent. on the capital invested. We were farming something like 70 farms, and I suppose the total would be about 5,000 acres.

18465. And your profit was how much?—£25,000. Of course, where we had the advantage was that we had a certain market for our produce.

18466. (Sir John Jackson.) You had not to pay long carriage to get your goods to the market?—No; of course, where we had the advantage was that we took all the debilitated stock from the transport and gave it, say, an hour's work a day and good feeding and rest on the farm, and in that way it was fit to go back to transport work again. It cost us practically nothing to feed on the farm, because we had plenty of cabbage leaves and things of that sort to feed that stock on which would only have rotted otherwise, and we were able to resuscitate the old trek oxen and to exchange them there for more poor ones whenever the transport came near us again. In that way we kept the transport going, and we also got our traction practically free; that is where we made our profit. I think that even if it had cost £25,000, instead of leaving that amount of profit, it would have been cheap.

18467. (Chairman.) You want a field detective department?—Yes, that is very important, because the amount of pilfering of supplies and things that went on was really astonishing. At every town and village we occupied the civil populace seemed to think that the British Army was their perquisite to rob as much as ever they possibly could, and without a detective department going to the various houses and places to discover and recover Army stores, our losses would have been immense. I had a detective department going on for some considerable time. It was very difficult to get convictions when you did lock these people up. The magistrate would never convict, but it had this desired effect, that although we got very little in fines, we recovered an enormous value in property. Here is the working of the detective department. I started to organise it in March, 1901, and up to the 31st March, 1902, the expenditure on it had been £5,563, and the receipts—that is, the value of supplies recovered and fines—amounted to £19,300. I got General Lyttelton before I left to give the staff between them a bonus of £1,000, which he did, and taking that into account, from the 1st March, 1901, to the 15th July, 1902, the cost of wages, rations, and everything with regard to the detective establishment was £14,523, and the value of stores recovered £28,979, showing a credit balance of £14,455; so that you see the detective department actually paid for itself over and over again.

18468. Was that chiefly pilfering by the people of the country?—By the people of the country.

18469. Did you find any trouble with the soldiers themselves?—Very little, except with rum and things of that sort—luxuries.

18470. (Sir Frederick Darley.) What class of men had you as detectives—some of the troops?—Nearly all civilians; in fact, as to the actual detectives themselves we, as far as possible, set a thief to catch a thief; we had men who had been convicted at various times, and who knew the ropes, and these men we employed.

18471. (Chairman.) Is there no provision for a detective force in connection with the Army?—I do not think so, as far as my knowledge goes. Of course they have got the Provost-Marshal and his policemen, who are supposed to do all that sort of thing, but their establishment was not sufficient, and they have quite enough to do without doing that. Where I found this so useful was that I could work it in with my unskilled labour corps; most of my overseers of the natives were practically detectives, and I could keep them moving. I moved a detachment of natives, and I would order one of the overseers to go with them; that overseer would be a detective, and he would be sent to a place where nobody knew he was a detective, and in that way I was able to work in the two things together.

18472. Something in the nature of a detective department is necessary in connection with any big expedition?—Undoubtedly.

18473. As to the system of supply accounting, what have you to say?—There I think our system in the field is a little too elaborate. We have to put very young officers into the field, and you want to reduce their responsibility as far as possible, to take responsibility off their shoulders and

Lieut.-Colonel H. C. Morgan, C.B., D.S.O.

enable them to keep their accounts up to date; give them a very simple form of account which they have to make up monthly; take all responsibility off their shoulders, and give them the one idea that they have to feed the men. Instead of that, under our present system, it is a little too elaborate; the young officer gets a bit flurried, and thinks more about his accounts than his supplies, and the result is that the men are not perhaps as well fed as they would be otherwise. If he got more latitude, more freedom, and less responsibility, he would feed the troops better, and there is no doubt about it that the feeding of the troops rests entirely on the supply officer of the brigade or division. If he does not do his work they will get nothing.

18474. How would you relieve him?—The idea I had has been very much criticised at the War Office by the Finance Department, but I formed what I called a central account, which was really a Clearing House account. The difficulty was that trucks of supplies would be consigned, say, from Cape Town to Bloemfontein, and on their way they would be re-consigned or diverted somewhere else, say to Springfontein, or some place of that sort, and they would be lost entirely. The difficulty was then that the supply officer to whom they were consigned would have to keep his accounts open for months until he could trace those trucks and render his accounts complete. In order to avoid that I instituted a Central Clearing House account, by which, when he found that he had certain trucks that had been consigned to him, and which never arrived, he gave credit to the person who consigned them to him from the base; he signed the way-bills, and signed for them as having received them, and thus cleared the base account all right, but in order to clear his own account he sent the way-bills on to the central account, which took them on charge as nominally having been received by them, and gradually when they turned up, as they would turn up, each depôt at the end of every month closed their accounts finally. If there was anything deficient, that is to say, if supplies never reached them which should have reached them, and they were consequently deficient of those supplies, they sent on the way-bill to the central account, which the central account accepted. If, on the other hand, they had supplies surplus, they sent a way-bill for those supplies, or rather, they accepted a way-bill for those supplies, from the central account, so that the central account got a surplus account, and a deficiency account, and the one was set against the other, and it became a Clearing House account, and so enabled each depôt and each supply officer in the field to close his account at the end of the month. If there was any question to be inquired into it was all done by the central account at headquarters, and it was very much easier done than it would have been done by some 50 columns in the field who had no method of communication and could not carry on a correspondence very successfully. That worked very well indeed; I started it in Natal, and it worked well in the Natal Army, and then I extended it to the whole Army.

18475. It is not approved at home?—The finance people do not approve of it, because they say it is only a paper account. I admit that, but it is the only possible means I see of avoiding difficulty. In fact, we could never have rendered our supply accounts at all for the war unless we had done it; the accounts would still be open. As it is, all the columns have been able to close their accounts; directly a column ceased to exist, the supply officer was able to render his account straight away, and he got credit for surpluses, and gave credit for deficiencies, and that ended his responsibility. The principal objection of the War Office authorities to it was that it opened the door for dishonesty. I admit it did, but we avoided that by not giving credit to any officer for supplies stated to be deficient unless we were satisfied that the deficiency was a genuine one, and that he had good grounds for the deficiency. If he could say, "Such and such trucks I never received, and that is the cause of my deficiency," or "Such and such a convoy of stores was consigned to me from such and such a place, it was met by a column on the road which drew supplies from it, I do not know how much they drew, but it arrived here so much deficient, and that must have been what they drew," provided he gave us reasons of that sort, we gave him credit, and, if not, we made further inquiry. I think the one thing really in the field is to reduce the responsibility of the officer in charge of the supply of a column in the field, otherwise the Army will not be properly supplied. Any means which will do that is justifiable.

18476. Is that all you wish to say about accounting?—I think that is the main thing.

18477. What have you to say about rations for newspaper correspondents?—That leads to a great deal of trouble; newspaper correspondents come along, and they want this, that, and the other thing, and they are supposed to pay for it before they get it, but in nine cases out of ten there is no possible means of getting them to pay for it, and even if they could pay for it, the supply officer does not like to get hold of money, as he might be robbed, and the result is that these people have to be given the things on credit, and there is a good deal of difficulty in getting it back from them. I think really we did meet the case afterwards by this form of requisition which we made them fill in (*exhibiting the same to the Chairman*). It is a requisition for all kinds of stores; it is a receipt and it is also a cheque.

18478. This is signed by the newspaper correspondent?—Yes. This is made out in quadruple, and three copies are sent to the supply officer, of which he retains one as a voucher for his account, and he sends two to the paymaster; the paymaster having got this cheque cashed, gives one to the person who cashes the cheque as a receipt, and retains one for the purpose of his account, and sends an acknowledgement back to the officer, who keeps the accounts as his voucher for the transaction. The fourth one is kept by the person who makes out the requisition as his document. It does for horses, mules, and everything of that sort, issued to anybody, and I think that really meets the case.

18479. Is that a new arrangement?—This was brought in about January, 1902.

18480. It is new in this war; it has not been used before?—It is quite new; it is as recent as January, 1902.

18481. Then you think that the administration of transport and supply in the field ought to be under one head?—I think so, certainly; supply is absolutely dependent upon transport; the troops cannot be supplied unless there is the transport. By separating them the supply officer is naturally anxious to get his supplies forward to feed the troops, and the transport officer, on the other hand, is anxious to keep his transport efficient, and the result is that the transport officer will try and keep some wagons in reserve; that is, he will not produce them because he wants to keep some animals fresh, and the supply officer is trying to overload the wagons to get the supplies forward; whereas if there is one officer in charge of both supply and transport, with others under him for the various duties, he has both interests at heart. The two services are so nearly allied to one another that it is absolutely dangerous to separate them.

18482. Have they been completely separated?—The idea was to separate them; they tried to separate them, but I do not think that quite succeeded. I think the idea is to separate them.

18483. What do you mean by saying the idea was to separate them—in South Africa do you mean?—No, for the future; they tried to separate them in South Africa, and I do not think it worked very well, and that is the reason it did not work.

18484. They are both branches of the Army Service Corps, are they not?—Yes, but I think the idea is to separate them.

18485. That you think would be a mistake?—I am quite sure of it. I think it would mean the ruin of the thing; it would be simply going back to the times of the old military train, when they had supply and transport separate. The two things are so intermixed that supply cannot be worked without transport, and they are so nearly allied that they are far better worked by the same officer.

18486. (*Sir Frederick Darley*.) Under the old system the commissariat officer had to provide the supplies, and he had to transport them to the place where they were wanted?—Yes, that was the system instituted by Sir Redvers Buller when the old supply and transport was remodelled into the Army Service Corps, and Sir Redvers Buller's organisation, which was that they had to do both supply and transport in the field, is the system, and the only system. To have a separate transport system only means chaos.

18487. (*Sir John Jackson*.) Do you know how they deal with the question in the German Army?—They are all one.

18488. (*Chairman*.) You make a comparison between

the English and the Indian system?—There is very little difference. I was always under the impression that they were very much the same until the Indian troops arrived from India. They had some Indian commissariat officers with them, and we had a very good opportunity of seeing the difference between the two systems. The main difference is that the Indian commissariat run both ordnance and supplies together; they have a system of go-downs; that is, when they get into camp the transport is loaded up separately with each item of supply, and they are told off to their various go-downs; for instance, they have a go-down for grain, a go-down for hay, a go-down for groceries, a go-down for bread, and a go-down for meat. The result is that having these various go-downs is very much simpler for the issue part of the business, but it is very much more elaborate for the troops who have to draw; whereas, under our system it is all put into the one *dépôt*, and the troops go and get everything they want

in the one place. Also in the Indian Army their warrant officers do for them the work our officers do for us; their officers do nothing but administrative work, and they do no executive work of any kind. In the field also their officers in charge of supplies are warrant officers really, and I do not think the troops are as honestly dealt with as they would be by an officer. Otherwise I think their system is a very good one.

18489. But you prefer our system?—Oh, yes; their officers have not the same knowledge as our officers have; they have only administrative knowledge, and they have no technical knowledge. I think they hardly know one thing they issue from another; they cannot tell you the difference between the various supplies they issue; they do not know it.

18490. Is there any other point you wish to direct our attention to?—No.

Lieut.-
Colonel H. C.
Morgan,
C.B., D.S.O.
12 Mar. 1903

FORTY-SIXTH DAY.

Friday, 13th March 1903.

PRESENT :

The Right Hon. the Earl of ELGIN and KINCARDINE, K.G., G.C.S.I., G.C.I.E. (*Chairman*).

The Right Hon. The Viscount ESHER, K.C.B., K.C.V.O.
The Right Hon. The Lord STRATHCONA and MOUNT
ROYAL, G.C.M.G.
The Right Hon. Sir GEORGE DASHWOOD TAUBMAN-GOLDIE,
K.C.M.G.

The Hon. Sir FREDERICK MATTHEW DARLEY, G.C.M.G.
Admiral Sir JOHN OMMANNEY HOPKINS, G.C.B.
Sir JOHN EDGE.

BERNARD H. HOLLAND, Esq., *Secretary*.

Major-General Sir G. H. MARSHALL, K.C.B., R.A., called and examined.

18491. (*Chairman*.) You have been good enough to give us a précis of the evidence you are prepared to give. The first point is with regard to the official position and functions you occupied during the War?—I proceeded to South Africa in October, 1899, as General Officer Commanding the Royal Artillery under Sir Redvers Buller. On the arrival of Lord Roberts to assume supreme command I accompanied him in the same capacity throughout the campaign. My functions were to advise the Commander-in-Chief on all matters connected with Artillery—to be responsible for the supply and distribution of Artillery ammunition, and for the transport in the field of ammunition of other arms—to be responsible for the administration of the Artillery in regard to *personnel*, *materiel* and horses, including distribution, postings, transfers, and replacement of casualties, and to take personal command when ordered in case of a general concentration of Artillery.

18492. You divide your evidence under four heads?—Yes, I propose to divide the subjects I am speaking about under the following heads: *Materiel*; *personnel*; horses, mules, etc.; tactics, organisation, and general remarks.

Materiel.

I produce a statement of the different natures of guns employed by us, which shows their relative power (*The statement was handed in. Vide Appendix Vol., page 193.*) I have put all these and the different technical information in the form of a statement. I thought perhaps you would prefer that to my going through a long list.

18493. Could you summarise it at all?—I am now going to summarise a few of the principal points.

The 15-pounder gun was the one most largely employed, the batteries, Royal Field Artillery being armed with it. The popular idea that this was a very obsolete and inferior weapon is not quite accurate. No other nation except the French had a better weapon. The French had for some years been secretly experimenting with a quick-firing gun, and had adopted it. Every other nation, including ourselves, was seeking in the same direction. A great nation cannot hurriedly re-arm its

artillery without due experiments. The Boers, on the other hand, requiring only a few guns, were able to go to the manufacturers and take whatever was in stock, and of the newest pattern. That they suffered from their haste and want of precaution I will show presently. I would also point out that even at the present moment the German Artillery is equipped with a gun which is practically the same as our 15-pounder.

18494. They have no quick-firing guns?—No. Krupp, their official manufacturer, has made some, and I believe is anxious for them to be adopted by the Government, but I believe the German Emperor does not agree with the French system; he thinks they have gone into a complicated system. It is interesting to note that the captured 15-pounders (that is the 15-pounders captured by the Boers from us) are said by some officers to have caused more annoyance to our troops than any other Boer gun.

18495. They did use them?—Yes, they did use them, and with very great effect.

18496. How did they get the ammunition for them?—They captured a great deal of our ammunition, and they also made ammunition in Johannesburg. They commandeered the whole of Begbie's works. Messrs. Begbie had very good engineering plant in Johannesburg. They were a very large firm of English engineers, and the Boers commandeered the whole of their works, turned Begbie out, put in Italian workmen and workmen from Creusot, and practically turned it into an arsenal and copied our ammunition, and made ammunition to fit our guns after they had used what they had captured.

18497. Their own ammunition would not have fitted our guns?—No. When I went to Johannesburg I overhauled Begbie's works, and we found there working drawings of how they made the ammunition to fit our guns.

As to the other natures of guns, the Horse Artillery were armed with a 12½-pounder, concerning which my remarks about the 15-pounder would almost equally apply.

18498. Does that mean that you think the Horse Artillery gun was an effective gun?—At that time, yes. Of course, it was an old-fashioned gun; being a 12½-

13 Mar. 1903.

pounder it was not as powerful as a 15-pounder, but it was practically on the same system. It was not a quick-firing gun.

18499. (*Sir George Taubman-Goldie.*) We have had information that the Horse Artillery gun was not useful?—Not useful?

18500. Not effective?—Was that from experts?

18501. I do not know quite what you call an expert—not Artillery officers, I must say?—But even so you might have a man who was an expert who was not an Artillery officer.

18502. In your opinion it was a good gun?—I think it was a good gun at the time. There are many faults about it, and we shall have a very much better gun. I shall presently show how we are to improve it, but at the time it was as good as we could get.

18503. You would not be in favour of abolishing these light guns altogether?—No, the light gun for Horse Artillery cannot be abolished.

18504. And substituting pom-poms?—I do not look upon the pom-pom as an Artillery gun. It has its advantages which I will deal with presently, but it was not considered by most Artillerymen as an Artillery weapon. It has its advantages, but not in that direction.

18505. (*Sir Frederick Darley.*) What was the range of the Horse Artillery gun—the 12½-pounder?—About 4,000 yards.

18506. (*Chairman.*) It was suggested to us that it might be a better arrangement if a gun equivalent to the Field Artillery gun was made sufficiently mobile to be used as the first gun, and abolish the light gun for Horse Artillery altogether?—That was a theory which was a very favourite one at one time, and it always will appeal to people to have the same weapon for the two, for the Field and the Horse Artillery. The Field Artilleryman is tempted to discard shell power and to get the mobility of the Horse Artillery; the Horse Artilleryman tries to get more shell power at the expense of mobility, and we had a case in our own Service a few years ago which was rather interesting. The two met, and we got one gun, that is the first 12½-pounder breech-loader was the same for the Horse Artillery and the Field Artillery. The consequence of that was that they had no sooner met than they wanted to fly apart, and it was absolutely necessary then to go back. The Field Artillery gun had only a 12½-pounder shell, which was not sufficient in shell power, and the Horse Artillery gun had, it is true, a 12½-pounder, but it had not mobility enough. In the manoeuvres in Berkshire in 1890, the Horse Artillery horses died in the shafts in trying to keep up with the Cavalry, and that we shall assuredly get if we try to get an equipment which is the same for both.

18507. I do not think that was the proposition; the proposition was that the 15-pounder gun, the Field Artillery gun, might be so much lightened as to be used by the Horse Artillery, and that for the Artillery, that followed with the Infantry, it would be possible to take the larger guns which were used in this War for the first time, I think?—I think if you went to any manufacturer you would find it would be impossible to lighten the Field Artillery gun so that it should go with the Horse Artillery; you would not be able to get a gun to fire that capacity of shell, and which would keep up with cavalry. As to the question of substituting a heavy gun such as the 4·7 for the present field gun, this would be impossible. Although such a gun can keep up with infantry on the march, it cannot move out of a walk. Field Artillery must have mobility sufficient to enable it to trot to a flank, or to the head of a column. It must be able to change position rapidly when supporting an attack, and also in advanced and rearguard actions. The necessity for mobility is accentuated by the extent of front now occupied by armies in the field.

18508. I am only putting it to you on account of the opinions expressed to us?—I may say that I speak rather with knowledge, because I am President of the Committee which is now sitting to introduce a new armament into the Horse and Field Artillery, and we have had the manufacturers up—we have had Elswick and Vickers Maxim—and they cannot do it. They can hardly give us now a Horse Artillery quick-firing gun, a 12½-pounder, of the requisite mobility we want. We have had the

greatest difficulty to get them to make a 12½-pounder quick-firing gun.

18509. Of course, you have the whole of that matter before this Committee you spoke of?—Yes.

18510. The object being to get a gun for Horse Artillery with as large a range as possible?—That is it. We want a gun for the Horse Artillery that will, when necessary, be able to come into line with the Field Artillery at the same range, and have the same man-killing effect at that range, and if you are going to have it fire the same shell you will not be able to make it keep up with Cavalry. Presently I am coming to what we are doing now for the future, and I have the permission of the Director-General of Ordnance to give you any information you like about what is being done for the future—what steps we are taking.

The 5-inch field howitzer; much has been expected from its lyddite shell. During the War the effect of lyddite did not fulfil the exaggerated expectations. The 5-inch howitzers, however, have, under certain conditions, and when well handled, proved themselves to be of considerable value, and notably in Natal in the case of the Battery commanded by Major Hamilton-Gordon. Of the heavy guns, the 4·7 guns used by the Naval Brigade and by the Royal Garrison Artillery, the 5-inch guns and 6-inch howitzers used by the Royal Garrison Artillery, were very useful and efficient. Two 6-inch guns were used on railway mountings and two on field mountings. A 9·2 gun was also very successfully mounted on a railway mounting, and with a detachment of the Cape Garrison Artillery travelled over the line as far as Machadodorp. Four 9·45 howitzers accompanied the Army to Pretoria in readiness for siege operations. I wish to call attention to the number of different natures of guns employed. This is a matter of serious importance. It can readily be understood how enormous was the difficulty of distributing so many sorts of ammunition amongst the various units operating in different parts of a vast country, and ensuring that there should be no mistake in supplying the right sort to each. I consider it is a matter of imperial importance to strictly limit the number in future, and to insist on the same patterns for home, India, and the Colonies. I suggest that the following should meet all field requirements:—A Field Artillery gun, a Horse Artillery gun, a Field Artillery howitzer, and a heavy battery gun (such as a 4·7 or 5-inch). Those would be the four natures, instead of having, as we had in South Africa altogether, counting heavy guns and all, fifteen different sorts of guns in the field.

18511. It is obvious that the difficulty with the ammunition must have been very great?—It was enormous. It is not right, and at any moment it might lead to disaster.

18512. But you managed it all through?—Yes, I am glad to say there never was any disaster, but it was a very great difficulty, because one had columns moving about in all parts of the country, and one not only had to watch them, but also the different kinds of ammunition to a column; some battery happened to get into it with a different kind of ammunition, and it made great complication. All that came about a great deal from batteries coming out not having what I call a standardisation.

Now, with regard to the system of ammunition supply, owing to the extent of country and the number of separate operations which were conducted simultaneously, it was not possible to carry out the service system of one ammunition park providing a large central reserve of ammunition. It became necessary that each division and the corps troops should have its own complete system of supply. The ammunition park, therefore, was not mobilised with animals in South Africa—the personnel was employed for the formation of advanced ammunition depôts on the railway in advance of the Ordnance Store depôts. The ammunition columns were each divided into two portions—one consisting of B.L. ammunition wagons, S.A.A. carts, and buck-wagons; the other of ox-wagons. The B.L. wagons were at first drawn by horses, subsequently by mules; the buck-wagons by mules. The proportion of ammunition carried by ammunition columns was:—

	B.L. Wagons.	Buck.	Ox.	Total.
12-pounder and 15-pounder	50	100	100	250
5-inch Howitzer	23	27	100	150
Pom-pom	—	1,500	1,500	3,000
Rounds per rifle S.A.A. Infantry	—	25	50	75

The Infantry were supposed to carry with the unit 177 rounds per rifle, in addition to the 75 rounds in ammunition column, but owing to the amount always available, commanders of units generally carried much in excess of these numbers. In some cases, under special circumstances, as much as 200 rounds were carried by each man on the person. The first portions of the ammunition columns were able to keep in close touch with their units, whilst the ox wagons formed a second line. The latter, when necessary, marched to the rear and refilled from the advance depôts at rail-head. These arrangements worked well. On no occasion during the campaign was there any failure of supply to any unit, and no instance of wrong ammunition being supplied. The behaviour of the *materiel* generally under the prolonged strain to which it was subjected may be regarded as eminently satisfactory. Major Bushe, R.A., an expert officer, who carried out inspections of all the equipments, in his last report stated that all Horse and Field Artillery equipment was in serviceable condition, only 10 per cent. requiring extensive repair or replacement. That was a very marked thing about the *materiel*, and so much so that some officers are apt to say that one margin of safety was too great, but I think that is hardly a fair criticism.

18513. Does that include the guns?—That includes the guns—the whole *materiel*, guns, ammunition, wagons, wheels, metal work, and everything connected with the gun and its equipment.

18514. (*Sir Frederick Darley*.) I suppose they meant by saying it was too great that it increased the weight?—That is what they said, but then of course it is very difficult to bring the margin down, and if you bring the margin down to a fine point you must have a larger percentage of breakages.

18515. That is what they meant, however?—Yes.

18516. (*Sir John Edge*.) Did you include harness?—No, I have got a separate note about the harness.

18517. (*Chairman*.) Will you proceed with your statement?—The following are the details of gun ammunition expended by the Royal Artillery in South Africa from October, 1899, to May, 1902.

	Rounds.
12-pounder B.L. (Royal Horse Artillery)	36,161
15-pounder B.L. (Royal Field Artillery)	166,548
5-inch howitzer - - - -	9,790
6-inch howitzer - - - -	55
4·7 Q.F. gun - - - -	3,035
5 B.L. gun - - - -	5,480
6 Q.F. gun - - - -	317
6·3 howitzer - - - -	765
12-pounder Q.F. gun - - -	6,056

What I call the 12-pounder Q.F. gun is the Naval pattern gun which was put on a field carriage and used principally by the Navy.

12½-pounder Vickers-Maxim - - -	765
Pom-Poms - - - -	193,837

The heaviest expenditure per battery in any action was at Magersfontein on the 11th December, 1899: "G" Royal Horse Artillery 1,250 rounds, 18th Royal Field Artillery 1,012 rounds, 62nd Field Artillery 1,003 rounds, 75th Royal Field Artillery 924 rounds, an average of 1,047 a battery. The greatest previous record in any war was made by the Germans at Mars-la-tour, viz., average per battery 51, maximum by one battery 1,164. Although the expenditure was so large throughout the War our demands on the War Office were at once complied with, and every assistance given by the Director-General of Ordnance for prompt replacement of ammunition and equipment.

1-pounder Maxims (pom-poms).—Previous to the War Messrs. Vickers had sold these only to the Boers and Chinese. Owing to its small calibre and bursting charge the pom-pom cannot compare with the Horse Artillery gun, either in range or man-killing power, and is admittedly not an Artillery weapon. Its effect was chiefly moral. It will probably be found useful in future by mounted troops on reconnaissance.

18518. (*Sir John Edge*.) Would the pom-pom be of any use in clearing a barricade, for instance, if you were following up a rear guard and the street was barricaded?—No, it would have no effect whatever.

18519. And the Horse Artillery gun would?—The Horse Artillery might not either.

18520. But it would be much more effective?—Yes, much more effective. The pom-pom would be absolutely useless, and you might as well fire with a pea-shooter against any sort of barricade. Its great use out there was that it was a very good weapon for clearing sniping parties, and the Artillery liked it very much for that reason.

18521. (*Sir Frederick Darley*.) What space does the bursting charge of a pom-pom cover?—The bursting effect of a pom-pom is extremely local; for instance, Captain De Horsey, R.N., when he was taking the guns into action, had a pom-pom shell burst between his two feet, and only one piece went into him, and that was the brass fuse that went into his ankle. The burst is very slight. Of course, if the pom-pom itself hits you it is a big bullet of a pound weight, but its bursting charge is trivial, and it cannot be otherwise with only a pound shell.

18522. (*Chairman*.) How was it that it had so much effect?—At the ranges it is used at you can see the shell striking the ground and making a slight puff of smoke, and therefore it is more effective than a small machine gun which fires only a small bullet, because that does not burst at all; the pom-pom has a bursting charge and makes a little puff, and therefore if you make a bad shot the first time you see the puff, and the elevator can be corrected according to the fall of the shell. There is the great moral effect of seeing the shell bursting nearer and nearer to one as corrections are made.

With regard to the Boer Artillery.—The Boer Artillery consisted of:—

Transvaal:

Four Creusot 155 mm. size guns (Long Toms) 6in.
Six Creusot field guns 75 mm., 3in.
Eight Krupp field guns, 75 mm., 3in.
Four Krupp howitzers, 120 mm., 4·7in.
Two Maxim-Nordenfeldt field guns, 3in.
Twenty-two Maxim-Nordenfeldt field guns, 1½in.
One Skoda field gun, 75 mm. (3in.), and about 15 others practically obsolete and never used.

Orange Free State:

Fourteen Krupp field guns, 75 mm. (3in.), of same pattern as those of the Transvaal, besides a few odd guns of no practical value.

Although these guns have relatively a longer range than ours their effect was much minimised by their faulty ammunition, which probably had been hurriedly bought and never tested. For instance, many thousands of fuses were fired in the Long Tom shells before the Boers discovered that, owing to an inherent defect in the fuse, the ammunition was quite useless.

18523. Did they rectify it afterwards?—They rectified it afterwards; they got these fuses back and filed off the thread; they found that the thread by which you screwed in the fuse into the bush of the shell was too deep a thread, and the shank of the fuse was too small compared with the head, and, therefore, on the shock of discharge this used to shear off and the fuse used to drop out of the shell, so that when the shell arrived at its destination it had no fuse, and naturally did not burst. The extreme ranges employed also rendered their fire ineffective owing to the high angle of descent of their common shell and the small remaining velocity of the shrapnel bullets. It was not uncommon for our men to be shelled by the Boers and for the shrapnel bullets to fall off their clothing like hailstones, not penetrating. The Boers were very fond of firing at extremely long ranges, at such ranges that there was practically no effective velocity left in the shrapnel bullet. Their dispersion by single guns, though a necessity, was carried out without any arrangement for concerted action, and often failed to have any effect. They had very few guns, and I think it was a wise proceeding on their part to divide their guns; they placed their guns everywhere, but they never had any system of signalling so as to bring a fire to bear on any point, and therefore they never really stopped us or had any concentrated effect. Their whole system consisted in saving detachments; they used to dig a hole near the gun, one man used to pull the lanyard and run into the hole where all the others were, and they used to lie there

Major-General Sir G. H. Marshall, K.C.B., R.A.
13 Mar. 1903.

Major-General Sir G. H. Marshall,

13 Mar. 1903.

until one fire had ceased; firing the gun attracted our fire, and they used all to lie in this trench they had dug perhaps 20 or 30 yards away until our fire slackened, and then they used to come out and fire another round, and that system is very much admired by some of our people, but I do not see that it had any effect. It certainly saved the detachment, but we try to teach our men that that is not the only thing to be done.

18524. (*Sir George Taubman-Goldie.*) Are you still in favour of massing guns?—Under certain circumstances, but I am going to speak about that presently; I am going to give my views upon that. At the same time it should be borne in mind that though the actual physical effect of the Boer artillery fire was small, it frequently caused annoyance and delay. Also, if the enemy use long range fire the moral effect on our troops is bad if our Artillery has not an equal range, even if neither fire have much real effect. The important lesson as regards *materiel*, demonstrated by the late war was the utter inefficiency as man-killers of common shell (even of 100 lb. weight) fired from guns even against defined and located targets, and the efficiency of good time shrapnel under similar circumstances.

18525. (*Chairman.*) We have had some evidence that there is an advantage in common shell, as I understand it, because it has more effect upon the enemy in their trenches, it makes them show themselves, whereas with the shrapnel they simply keep hidden, and therefore some common shell carried with a gun is an advantage?—With the field gun experiments for years were carried out on this subject, and there is abundant evidence, I think, that with the modern field gun the common shell has no more advantage than your shrapnel shell used with a percussion fuse. You can always use your shrapnel as a percussion shell, and it bursts when it hits the ground, and it has been proved by experiment for many years that that is quite as effective as, and more so, than the common shell, and therefore it is no use carrying about a separate ammunition which is not a man-killer, and which you cannot use as time shrapnel. The advantage of the time shrapnel is that you carry only one ammunition, which you can use as a percussion shell or as a time shell.

18526. (*Sir John Edge.*) Would the percussion shrapnel shell be as useful against stone sangars, for instance, as the common shell?—Quite.

18527. You mean that anything that common shell could do the percussion shrapnel would do?—Yes, that is the great point, and it is not known by officers who talk about common shell; naturally, a great many of the officers out there who talked about common shell really did not know that all these experiments had been carried out, and that the whole thing had been threshed out over and over again; for instance, they wanted some years ago to destroy a coastguard quarter at Lydd which was no longer used, and they very wisely, instead of pulling it down fired at it, and had experiments as to the efficacy of common shell and shrapnel against the building, and it was found that practically the percussion shrapnel was just as good, that is to say that of two walls in a room one wall will keep out neither; they will both go through one wall, and the second wall will stop both. That was a very important experiment.

18528. (*Chairman.*) Did they use the percussion shrapnel in the war?—Yes, we always do; at ranges beyond the setting of the time fuse—beyond the extreme limit of the time fuse—you are obliged to use it as a percussion shell.

18529. I am only giving you the opinions that have been expressed to us by several commanders of columns; do you think that is under a misapprehension?—I think that is entirely under a misapprehension; I think it all comes from officers judging of these things only from the gun end of the range. The officers mostly who talk about these things have never seen the effect of projectiles at the target end of the range. I may say that the object of all Field Artillery ammunition is man-killing and not the damage of material. We have for many years acknowledged that it is impossible to do any damage to material with either common or time shrapnel. We do not attempt it, and not only that, but we do not profess in the Artillery to kill, people who get underground, with time shrapnel.

18530. (*Sir John Edge.*) Assuming, for the purpose of the question, that it was found that shrapnel only made the Boers lie close in their trench, and that common shell turned them out of their trench, can you account for the difference in effect?—Yes, I can; I think it is very likely that that might have happened in that particular case, because the reason for that, I should say, would be that the flight of the bullets of the shrapnel over the trench always has the effect of keeping the men down in the trench, and that is generally our only object in firing at trenches, to keep the men down in the trench and prevent them firing on our Infantry who are advancing. In the case you mention I should think it very probable that the common shell naturally did not burst in the air, and by very good luck fell in the trench, and, naturally, if a shell falls right into a trench among the men they will clear out.

18531. (*Chairman.*) I think that the point of view from which it was put was the difficulty of seeing the Boers at all, they were always so much hidden, and if they had a common shell thrown in amongst them under those circumstances they showed themselves, and enabled our men to get the range?—I never saw that sort of case happen myself. At Paardeberg we had common shell of quite a different nature; we had the 4.7 firing at the Boers in their trenches, and we also had the howitzers firing at the Boers in their trenches, and we never made them move. Their trenches were exceedingly hard to locate at Paardeberg; the river bed was very deep, and our 4.7 guns and our howitzers never made them leave their trenches, although they were firing nothing but common shell, and common shell of a large nature.

18532. (*Sir John Hopkins.*) I think the strong point made by those in favour of carrying more common shell was the larger bursting charge that the common shell carried; the difference between the bursting charge of the shrapnel and the common shell is very great I take it, as the one is simply to break the wall of the shell containing the bullets, and the other is for explosive effect?—Yes.

18533. And in the evidence before us we have had it very strongly from many officers that they prefer a larger quantity of common shell to be carried?—May I go into that a little fully, because it is an interesting point, and if you will allow me I will go into the history of the abolition of common shell. What you are stating as having been told you I think might have applied to a common shell of a past period; when we used iron common shells with a bursting charge, the effect of that explosion on the shell was that the iron shell broke up into several pieces. That was when guns were fired with a small initial velocity, and you were able to use iron common shell with great advantage, because the cast iron broke up so on the ignition of the bursting charge, but presently we had to introduce guns of a much higher muzzle velocity, and the moment those guns were introduced we were obliged to do away with cast iron as the material for common shell, because the cast iron shell could not stand the shock of discharge of the gun, and used to break up at the muzzle. That was the reason why cast iron had to be given up. The material would not stand the shock of these heavier discharges owing to the necessity for higher muzzle velocity. We then had to introduce steel common shell, and they had to be made of tough steel to stand the discharge. Then what happened to our common shell, and would happen if we were to introduce common shell, was that every shell, when it exploded, did not burst at all; it simply ripped and let the gas out. You could get specimens of that from our Arsenals; they must have kept many of them. That went on for some years, and it became perfectly apparent that it was no use at all as a man-killer. Of course, if one of these shells exploded on a man it killed that one man, but it had no explosive effect; although there was a much larger charge of powder inside the shell than in the shrapnel, the only effect was to make a rent in the shell; the shell very rarely went into even two pieces, and it just made a rip.

18534. (*Sir John Edge.*) It did not break up?—Not at all, and if you were to introduce common shell into our guns now, especially with the velocities we have, you would have exactly the same result. The people who ask, "Why not have common shell with its large

bursting charge?" are thinking of the old common shell, and they do not know what has been going on.

18535. (*Sir John Hopkins.*) In connection with field operations a great many witnesses are unanimous as to the effect of common shell in the field as against shrapnel?—Did the witnesses see the shells after they burst?

18536. They judged by the effect on the enemy, I fancy—witness after witness?—The evidence that I have seen, and I think you will find it all recorded in the office of the Director-General of Ordnance—the evidence of all the people in South Africa which I took before I came away from Pretoria—from our Artillerymen in the field, was unanimous about the inefficiency of common shell. The evidence that I have got is overwhelming.

18537. (*Sir George Taubman-Goldie.*) Has there been any official enquiry on the question?—Certainly.

18538. Is there any document issued on the matter?—The Commander-in-Chief would be able to give you the reports of all the Artillery officers on the spot, because I took them all before I left Pretoria, and handed in a report about it.

18539. (*Sir John Hopkins.*) Was there any segment shell used?—Not by us, not by our Regular Artillery; they may have been used by one or two private batteries that came out, but not Service Batteries.

18540. Are you using segment shell now?—No.

18541. You have given it up?—Yes. It would be worth while getting the evidence if you wish it, and I could arrange to get it for you.

18542. (*Chairman.*) It is rather a technical point?—I can say generally that the evidence on the part of Artillery officers who were shelled by the Boers throughout the campaign is overwhelming against the efficacy of common shell. I think it is unanimous.

18543. (*Sir George Taubman-Goldie.*) Did you take the evidence of any Generals of Divisions?—No, I took the evidence of all the Artillery officers. I had a Committee in Pretoria while they were all red-hot about it. I thought it useful to get it then, and it has been all recorded and officially filed.

18544. (*Chairman.*) I think we should see your Report?—If you wish, I can get it for you; you would like to get all the evidence bearing on the subject of common shell? *

18545. Yes?—I will get it.* I still adhere to this, that the evidence of people about Artillery fire must be discounted unless they actually have seen the effect of the shell. I can state one of the reasons why common shell was abolished. While the discussion was going on at home about its abolition the one thing that impelled the Government at home to abolish it, was a strong letter that came in from Lord Roberts, then Commander-in-Chief in India, and he urged that it should be removed at once as being most useless. I could get you that letter as I have a copy of it at home. That was some 13 years ago when this was discovered about the uselessness of this shell that only gaped and did not burst.

18546. I think we should like to see that, too?—I will have that put in with this other evidence, if you wish it. †

18547. (*Sir Frederick Darley.*) Can you make a segment shell also a shrapnel shell?—No, it is quite a different effect; with the segment shell it depends on the segments being dispersed by centrifugal force.

18548. It is cut up into pieces?—Yes, and when the shell opens the centrifugal force spreads the different segments and you have a large bursting charge.

18549. I see that this evidence was given at question 17047; the Chairman put the question: "The effect of the long range guns of the Boers was moral rather than actual?" (A.) Yes. (Q.) How is it that if a shell dropped among you it did no harm? (A.) I cannot explain it. There was the case at Poplar Grove, where the Boers got the range of my Naval battery exactly, and they dropped shells into the battery for a good hour. I asked the officer commanding if he thought he ought to change his position, and he said he did not mind in the least, and he stayed there, and they dropped shells among that battery and never even touched a man, a mule or wagon, or anything else. It was not that they were firing badly, they were firing very well, and they probably thought they were doing tremendous execution, dropping

shells into the middle of us. (Q.) Was that shrapnel? (A.) That was segment shell. (Q.) Did the shells burst? (A.) Yes, they burst. (Q.) And still did no damage? (A.) No, it so happened that for a whole hour making good practice they never hit a thing?—I can explain that from my own observation of their fire. I have seen the same sort of thing, and there was no doubt in my mind what happened, because I have seen the shells fall. It was due to firing at an extreme range; if you fire at an extreme range you have an extreme angle of descent, and when your shell goes into the ground at that angle, the effect is only upwards. I have known cases of men going to a 100 lb. shell dropped near them like that and picking every piece of the shell out of the hole; it buries itself before it explodes, and it goes in so vertically that there is no lateral effect. That sort of thing continually happened during the War, and that is why I mentioned it in my statement.

18550. That is why I asked you as to whether a shrapnel shell could be combined with a segment; you say you cannot do it?—No, if you have these segments you have very little space inside for the powder. You have a long narrow cylindrical space inside for the powder, and you could not put bullets into that, and yet keep up a powder charge sufficient to throw your fragments apart.

18551. (*Sir George Taubman-Goldie.*) And does your objection to the somewhat vertical fall of a shell apply in a lesser degree to howitzer fire? We have had a good deal of evidence in favour of howitzers as against guns of lower trajectory?—Yes, it does apply a good deal to howitzers, but the point about a howitzer is that you really must have it at a high angle because you want to search out cover, and you want it to drop into trenches and sheltered places. What I object to is an excessive high angle fire for field guns, because you lose the effect in that way; with field guns you want a danger zone in depth as well.

18552. In fact you do not look upon field guns as things that can clear trenches at all?—No, you cannot clear trenches with field guns, and nobody would attempt it. All that you can do with trenches with field guns is to make the people keep their heads down and save your own men from being fired at when they attack.

18553. I think that accounts for a good deal of the difference of opinion between you and the generals, and others who have given their evidence here?—I think a good many people do not know that; for instance, I have read about the enormous amount of ammunition we fired, and a great many people demand a return of how many people we killed with all that, but that is not the point; Artillery fire sometimes is not meant to kill—it is meant to save your own people. If you get a rabbit into a hole and you go on firing you keep it in there, but you will not kill it.

18554. (*Sir Frederick Darley.*) It is not so much to kill the enemy as to provide a zone of safety for your own people?—Very often; in fact, in all future wars it is recognised that an Infantry attack will only be possible when the Artillery are firing along the whole front of the enemy, and making them keep down, and that will be the only way in which a frontal attack will be possible in future in consequence of smokeless powder and the magazine rifle.

18555. (*Sir George Taubman-Goldie.*) And for that sort of fire shrapnel will be much more valuable than common shell?—Much more.

18556. (*Chairman.*) Your next head is future armament?—Immediately after the return of Lord Roberts in January, 1901, a committee of officers of Horse and Field Artillery, who had served in the War, was appointed for the purpose of introducing a new armament of the Horse and Field Artillery. The Committee have recommended the introduction of a quick-firing field gun, firing a shell of 18½ lbs., with every modern improvement, including shields, with such range and power that it has a shrapnel man-killing effect at 6,000 yards, and of no greater weight behind teams than at present.

18557. That is to take the place of the field guns?—That is in place of our present 15-pounder; we propose to have an 18½-pounder. A similar Horse Artillery gun of same range and shrapnel effect, but with a 12½ lb. shell; weight behind teams 28 cwt., or 2 cwt. less than the present Service gun.

Major-General Sir
G. H.
Marshall,
K.C.B., R.A.

13 Mar. 1903.

* The Report was subsequently sent to the Commission. (See *Appendix Vol.*, page 195.)

† Lord Roberts' letter is referred to in the Report which was subsequently sent to the Commission. (See *Appendix Vol.*, page 195.)

Major-General Sir
G. H.
Marshall,
K.C.B., R.A.

13 Mar. 1903.

18558. Less than the present Horse Artillery gun?—Two cwt. less than our present Horse Artillery gun: a field howitzer of the same weight behind teams as the field gun, firing a 40 lbs. shell, and with greatly increased range. Two batteries each of the 18½-pounder and 12½-pounder will be issued this year for final trial at practice. We have been trying these guns all last year at Shoeburyness and at Okehampton, and they are being made by the Elswick firm and Vickers Maxim. We have been able to get this increased power owing to the great improvement that has taken place of late years in the manufacture of steel. That is all I put down about our new equipment, but if there is any other point I will be glad to explain. The French quick-firing gun, which, up to now, is the best of that type, is a 14 or 15-pounder, so that we have gone considerably ahead with our 18½-pounder.

18559. What about the heavy guns?—That does not come under my Committee; we are only concerned with the Field and Horse Artillery.

18560. Would it not be intended to have heavy guns in the field in future?—Yes, it is intended to have them; amongst the different types I mentioned as accompanying the Army in the field, I think you will find I said a Field Artillery gun, a Horse Artillery gun, a Field Artillery howitzer, and a heavy battery gun (such as a 4·7 or 5-inch).

18561. And it would be intended that a heavy gun of that description would accompany a column in the field?—Yes, but it does not come under the province of my Committee that I am President of; we have only to deal with the Field and Horse Artillery gun, and therefore any information that I gave you about that gun would be hearsay. I would be glad to tell you what I have heard, but it would not be direct evidence.

18562. You can say what your evidence is as to the work of these guns in the field?—I think they were extremely useful, and as I have said, as long as the Boers or anybody else have a long range gun against us we are bound, even if only for the moral effect, to have a gun of equal range.

18563. And they can be made sufficiently mobile?—They can be for their own particular rôle; we are going to have three batteries of them. I know that three batteries of 4·7 guns of four guns each are coming to Aldershot this summer. They are going to form part of the corps Artillery at Aldershot, and they are to be manned by companies of Garrison Artillery, and they are to have horses to drag them, but it is contemplated, I believe, to have traction engines. They are experimenting with traction engines, but I am only telling you what I hear.

18564. It was the experience in the War that it was possible to take them about even with columns which were continually on the march?—Perfectly; they accompanied Infantry the whole time; of course, one had to arrange, and if you wanted to use your 4·7 early in the day you took care to put it well at the head of the column, but the team of oxen was quite capable of keeping up with the Infantry.

18565. (Sir Frederick Darley.) How many horses would it take to draw a 4·7 gun?—I think the weight is going to be 4 tons, and they are going to have eight horses. I do not know whether that will be sufficient, but that is what they are going to try. Eventually the idea is to have traction engines.

18566. (Chairman.) You think there was an advantage in these heavy guns, the 4·7 guns?—Undoubtedly, I think they were very effective.

18567. It had not been recognised before the War?—No. It had in India; we had in India the heavy battery—the 40-pounder—for many years.

18568. But in equipping the expedition for South Africa it was not supplied?—No.

18569. (Sir Frederick Darley.) What is the weight of the projectile of the 4·7 gun?—A 50 lb. shell.

18570. So that it is a more powerful gun than the 40-pounder?—Yes; you will find that all the guns of the present day are much more powerful in comparison with their weight owing to the improvements in manufacture and material.

18571. (Chairman) Will you proceed with your statement?—The saddlery and harness were found to be too heavy. A much lighter pattern is now being tried in

which the great feature is the substitution of breast harness for the neck collar. That has been sanctioned; we have that now at Aldershot with the breast harness and with the harness considerably lightened, wire traces, and, in fact, the horses are in a sort of skeleton harness.

Personnel.

Now as to personnel. The following is a statement of the Artillery employed in South Africa from 1899 to 1902:—Royal Horse Artillery, 10 batteries and three ammunition columns; Royal Field Artillery, 15 brigade divisions, 45 batteries, and nine ammunition columns; Royal Garrison Artillery, 14 companies, two mountain batteries, pom-poms, 22 sections; Canadian Artillery, three field batteries; City Imperial Volunteers, one field battery; Elswick, one field battery; Australian, one field battery; New Zealand, one field battery.

SUMMARY.

Officers and men	-	-	-	-	-	12,000
Guns { Field	-	-	-	-	-	372
Guns { Garrison and Heavy	-	-	-	-	-	79
Guns { Mountain	-	-	-	-	-	8
Guns { Pom-poms	-	-	-	-	-	44

The capacity of the Royal Artillery officer in every respect was universally acknowledged. Every general and column commander bore testimony to his efficiency, I attribute this result to his early training at the Royal Military Academy, and to the excellent system in a battery by which he at once as a young officer obtains responsibility and command of a section. He comes into the Artillery to make it a profession, and he is in every way encouraged to do so. It is not true of the Artillery officer that keenness in his work is unfashionable. The physical and intellectual capacity of the men was also very good—naturally there was a falling off in training of the men sent out late in the War. The standard of physique of the gunner in the Royal Field Artillery was too low. This has just been raised (A.O. 51, March, 1903). As regards both officers and men their devotion and discipline under fire were the admiration of the whole Army. For many years our Artillery had been striving to train for war—great efforts had been made in this direction in practical gunnery, and especially in a rigid system of fire discipline, and in practising replacement of casualties. Then the guerilla stage of the war was entered on, and the work of the artillery as gunners was over; they were largely employed as Mounted Rifles and acquitted themselves equally creditably in this rôle. As an instance of the keen spirit amongst the men and their previous good training—210 Non-Commissioned Officers and gunners were called for from Aldershot last year for mounted rifle work. These men had never used a rifle, but in a few weeks' training before embarkation 208 became "marksmen."

18572. Were those men got from the same class as the Infantry soldier?—Entirely. There is no difference; there is no selection for the Artillery.

18573. How is it that they develop into such intelligent men?—I attribute it very much to the system I have spoken of—the good system of the young officer being at once put in command of an organisation, and also to the continual training for gunnery that our men have been getting for many years—the systematic continual training of their eyesight to practise them in laying the gun.

18574. (Sir George Taubman-Goldie.) You think highly of the training of the cadets at Woolwich?—Speaking generally, yes.

18575. Do you see any reason why an equally good training should not be introduced into Sandhurst?—No, but I should not like to say anything about it because I do not know what the training there is.

18576. But you do not see any reason why it should not be equal to Woolwich?—No.

18577. (Lord Strathcona and Mount Royal.) Do you know anything of the officers who were trained in the Royal Military College at Canada? Have you seen any of them?—I have; I know a Royal Engineer officer who was trained there.

18578. But there are a good many of them in the Army?—Yes, they have a very good reputation in the Service, and particularly the one I have met—and of course we all know about him—Colonel Girouard. He was an excellent man in the Royal Engineers in South Africa, and he was chief of the railway system.

18579. He proved himself a very able man, but I think there are many other capable officers from the Royal Military College in Canada. According to the system in force there are four commissions given to successful cadets each year—the highest in the examination has the option of entering the Engineers, while the others go to the Artillery, Cavalry and Infantry. In some years the number of commissions is increased?—I have two at Aldershot now, I remember, and they are very good officers indeed.

18580. So that in a sense there is a selection for the Engineers and Artillery from this College?—From Canada, yes.

18581. (*Sir Frederick Darley.*) Had you an opportunity of seeing the Australian battery of Artillery?—Not personally.

18582. It was from New South Wales?—I had very good reports of it always.

18583. They were commanded by a Regular Artillery officer?—I had very good reports of them always.

18584. Colonel Smith is an Artillery officer?—Yes, S. C. U. Smith, I know the officer you mean—a very efficient officer.

18585. I believe he got them into a very high state of efficiency—

18586. (*Chairman.*) What is your next point?—The supply and quality of drafts was satisfactory. Between October, 1899, and May, 1902, 4,870 men were sent out. In every way our demands for officers and men were promptly met by the Adjutant-General. It is impossible to give enough credit for this, considering that in addition to replacing our large casualties, 59 new batteries of Horse and Field Artillery were raised at home during the war.

As regards training the Artillery soldier for efficiency in the future, sufficient inducements should be offered to the non-commissioned officers and artificers in the way of promotion and prospects. The Artillery man is at a disadvantage in these respects compared with men of other arms. In the Infantry and Cavalry every man has a chance of rising to be a regular regimental officer; this cannot be so in the Artillery, owing to the necessity of a higher technical education. This makes it all the more necessary that our men should at least have the same chance as others in the matter of commissions as riding-masters, quartermasters, and in warrant and regimental ranks. For instance, there are 61 riding-masters and quartermasters in the Cavalry for 17,873 non-commissioned officers and men; 41 in the Horse and Field Artillery for 30,718 non-commissioned officers and men.

18587. (*Sir George Taubman-Goldie.*) How long do you think it takes to make a good gunner of Field Artillery?—About two years.

18588. (*Sir Frederick Darley.*) Are the terms of enlistment the same in the Artillery as in the Line?—Yes, it is three years with the colours and nine in the reserve; but after six months a man can extend his service with the colours to eight years.

18589. (*Chairman.*) What is your next point?—The rôle of Artillery in future war will be greatly increased in importance. This, in addition to all the modern developments of fire tactics and quick-firing equipments, will make it necessary to have the officers of Artillery highly educated in their profession. The requisite standard cannot be maintained if the officer has no prospect of a career in the higher ranks of the regiment, and if, at the same time, all high commands in the Army are closed against him. As regards a prospect in the regiment, it is becoming a proverb that the Artillery officer's career is over after he has done his time as Major Commanding a battery. To-day the position of the Lieutenant-Colonels and Colonels as regards chance of employment is deplorable, and they are in despair as regards future employment. There are sixty Lieutenant-Colonels and there are six Colonels regimentally employed in the Horse and Field Artillery; whereas in the Infantry there is a Colonel Commanding a Regimental District for about every two Lieutenant-Colonels. In the late War there was only one instance of an Artillery officer commanding a Division, and there is a general feeling amongst Artillery officers that they are practically debarred in peace time from obtaining any higher Army commands. As regards the want of regimental prospects this can be remedied

by the appointment of colonels in each Army Corps to command the divisional and Corps Artillery respectively. I will show presently how this can be done under the new organisation of Army Corps. As regards Army commands, there does not appear any reason why Artillery officers, if qualified, should not be allowed a fair share. Their efficiency in war is universally recognised, and it seems contrary to justice and to the interests of the public service not to employ them.

The want of a reserve of officers was much felt. Practically, we have no reserve of officers, for no young officers exist in the reserve, and the older officers are so out of date as to make them of value only for dépôts, etc., during war. Officers, therefore, were taken from batteries lower down on the roster than those that were being mobilised and appointed to ammunition columns; the result was that when those batteries were required to be mobilised trained officers were not available.

18590. That was a difficulty that was felt throughout the Army?—Yes, right through, I believe.

18591. (*Sir George Taubman-Goldie.*) Have you any remedy to suggest?—I think it would be possible to have a sort of Militia reserve, officers who had left the Army early in life, as they often do, and if they were induced by being allowed to wear their uniform and keep their rank, and to come out say with the Militia once a year, so as to just keep them in touch, one might do something in that way.

18592. Would you bring them back as subalterns in time of war?—They would come back with the same rank as they left with; majors came back during the War, and were commanded by people who had been their own subalterns in some cases, but they did not mind.

18593. And it worked?—Yes. I think in war time that makes no difficulty.

Horses, Mules, etc.

18594. (*Chairman.*) What is your next point?—The supply of horses was adequate, and the quality satisfactory, until perhaps quite the later stages. The English "bus" horse was the best for Artillery purposes, and hardiest. The mules were good, and easily kept in condition—they were found most useful in the ammunition columns. It is very important that all remounts should be landed in anticipation of requirements, so that they may be got into condition before being put to hard work.

18595. You say something in your précis about expenditure; have you anything to say about the expenditure on horses and mules?—Of course, the expenditure, or wastage, was very great, and I think in the Artillery that was not due to want of horse-mastership, because we pay a great deal of attention to that in peace time, and I think if you were to ask generals and commanders—

18596. We have had a great deal of evidence to that effect, that the Artillery horse-mastership was distinctly the best?—It is always acknowledged. I have often heard officers congratulate me on the fine example our officers showed in the care of their horses, and how much they saved their horses. I think the wastage of horses was due to that point I have emphasised there. I am not blaming anybody; it could not be helped at certain stages of the campaign, but horses were taken out of the hot hold of a ship, they were in fairly delicate condition from the voyage, and they were put into open trucks and travelled three or four nights like that. It is impossible to feed and water horses properly under these conditions, and they were taken out of the trucks and immediately went on a long march under service conditions. If you do that, of course, you must lose horses, but sometimes it cannot be avoided.

Tactics, Organisation and General Remarks.

The value of cover and the power of concealed guns, rendered practicable by smokeless powder, has come out strongly. The Boers had few guns and dispersed them over a large extent of front, and this led us in many cases to breaking up batteries into sections, and to the use of the section as a fire unit. The great efficacy of the battery as a fire unit consists of its employing a stream of fire 100 yards wide—and there are other advantages such as the control and supervision of the fire by the Major. Provided, however, control of fire can be kept, every latitude should be allowed a commander to disperse, when he thinks it advantageous to do so in accordance with the tactical situation and ground. Experiments

Major-General Sir G. H. Marshall, K.C.B., R.A.

have been carried out during the past year in these subjects. The necessary instruments have been provided for firing with accuracy from hidden positions. The necessity for the provision of heavy guns with the field Army was one of the most striking lessons of the War, and this will lead to the introduction of a five-inch gun, three batteries of which will form part of the corps artillery of each Army Corps.

18597. (*Sir George Taubman-Goldie.*) Are any foreign nations adopting the heavy gun now?—Not that I have heard.

18598. (*Sir John Hopkins.*) What is the size of your batteries now? Is the number of guns still six?—The field battery and the horse Artillery six.

18599. (*Sir Frederick Darley.*) Is it six in time of peace?—Yes; we have varied sometimes in the lower establishments and have had four gun batteries, but six is the normal condition in peace time, but batteries on the lower establishment do not have horses for all six guns.

18600. (*Chairman.*) What is your next point?—Hitherto Artillery has been organised in peace time on a system quite different to that in war. Thus a general commanding a Division in war found himself for the first time with Artillery forming part of his command. Since January 1st, each Division has two Brigade Divisions of Artillery, each consisting of three batteries—these form part of the Divisional General's command, and he is responsible for their discipline, training, and efficiency for service. This is a great advance not only in the training of Artillery, but also in the training of our generals commanding Divisions. In the past it has been quite common for a general to be ignorant of the elementary principles of Artillery tactics, fire, and effect of projectiles, and supply of ammunition. In order, however, to render this system effective, there should be a colonel appointed to command each divisional Artillery. It will also be impossible to get efficient officers if no opportunity be given in peace time for training in the higher commands. As our new system is copied from the Germans it is interesting to compare it with the German arrangement in peace:—Each Division has four Brigade Divisions of Artillery—that is double what we have. For every two Brigade Divisions there is a colonel in command, and a general commands the four Brigade Divisions. Thus with a German Division there are 72 guns, and the higher Artillery commanders are one general and two colonels. In their Army Corps, which consists of two Divisions, there are, therefore, 144 guns under the command of two Artillery generals and four colonels. Compare this with our method. Our Army Corps consists of three Divisions; each Division has two Brigade Divisions of Artillery, or 36 guns. Total divisional Artillery, 108 guns. In addition we have a Corps Artillery, viz.:—One Brigade Division (two batteries) Royal Horse Artillery—12 guns; one Brigade Division of howitzers (three batteries), 18 guns; and one Brigade Division of three heavy batteries, 12 guns. Total Corps Artillery, 42 guns. The total, therefore, of our Army Corps Artillery is 150 guns. For these one general commanding is considered necessary, and no colonels. This seems an unsound system, as on mobilisation for war four colonels would have to be appointed, three for divisional and one for Corps Artillery, who would have had no previous training in command.

Then as to efficiency in gunnery. The training in gunnery for efficiency in fire effect in war should, of course, be of paramount importance. This cannot be attained without annual practice under service conditions as far as possible, and this again cannot be done without good ranges. This does not seem to have been thoroughly appreciated. It is no doubt difficult to obtain convenient artillery ranges, but those we have should be utilised to the fullest extent and nothing allowed to interfere with the firing rights when acquired. I would like to give you an instance of what I mean in that respect; it appears rather vague, but I will give you a concrete instance. Some six or seven years ago I was commandant at Okehampton at a practice camp there for the Field Artillery. It was practically our only training ground for Field Artillery, and we had about 30 square miles of ground there on Dartmoor, which we leased from the Duchy of Cornwall, and we had firing rights over the whole of that. I was extremely anxious to get a range

of over 4,000 yards; we had no range of over 4,000 yards, and there was one point from which I could get a fine range of over 6,000 yards, if necessary, called Watchit Hill. I was unable to fire from Watchit Hill, because there was a farm in the way, and I made every exertion to get that farm bought by Government, and at last I succeeded in getting that farm bought right out, and therefore I was able to fire from Watchit Hill over this farm right away for any distance, and we were all overjoyed at having got such a fine range. We had no sooner done that, however, than the War Office made an agreement with a village behind the range altogether, not to fire from this Watchit Hill, and that agreement exists to-day. We had bought the farm, and we might have been practising these long ranges before the War. I represented it over and over, and over again, but there it is; there is Watchit Hill, and we have the right to fire from it, but the War Office have chosen to make an arrangement in spite of my protests with these Belstone parishioners.

18601. (*Sir John Edge.*) In rear of the firing line?—Yes.

18602. (*Sir George Taubman-Goldie.*) On account of the concussion?—I do not know on what ground.

18603. They must have put forward some ground?—I presume so, but I am not aware of the reason.

18604. (*Sir Frederick Darley.*) How far was the hill from the town?—It is a little village called Belstone, and I should say it is about a mile.

18605. So that the concussion could not affect it?—It cannot affect them; it is about the same distance as our ranges are to the large town of Okehampton, and there is no reason whatever for their objection.

18606. (*Sir George Taubman-Goldie.*) Did you never hear on what ground it was done? There must have been something put forward?—No, I was shown the draft of the agreement which they were making, and against which I protested strongly.

18607. (*Sir John Edge.*) Had the War Office forgotten you had got the range when they made the agreement with the village?—No, because the agreement was sent to me for my remarks.

18608. (*Chairman.*) Is it a lasting agreement?—It is an agreement that can be terminated; it was to be terminable at six months notice on either side.

18609. So that it is in the hands of the War Office now?—Yes, and we have been going on for six or seven years trying to induce them to give us that.

18610. (*Sir John Edge.*) Possibly the War Office may not think a 6,000 yards range is required in the country?—But they had bought the farm for the express purpose of giving us this extra range.

18611. (*Sir Frederick Darley.*) Did the village claim Common Rights?—The parishioners all round claimed Common Rights.

18612. (*Sir John Edge.*) Had we any guns in South Africa with a range of over 6,000 yards?—Our field guns would carry to over 5,000, but we had no fuses that we could set over 4,000 when we first started. Afterwards we got fuses that were available for 5,000. The Boers got an extraordinary range from our guns when they captured them by putting two cartridges in.

18613. (*Sir John Hopkins.*) You say you have got the fuses now to burn for 5,000 yards; are you contemplating a further range of fuse?—Yes, we are contemplating a range of 6,000 yards. In my description of our new 18-pounder, that is to have a man killing shrapnel—that is to say with a time fuse to burst at 6,000 yards.

18614. Had you any complaints about the erosion of the field guns?—No, nothing important except in a few cases; the inspector I sent round—Major Bushe, whom I mentioned just now—was continually travelling around. He came out as an expert from the Arsenal, and he reported very well upon them, saying that only 10 per cent. wanted anything. I think the guns by this time have considerably worn down, naturally.

18615. But, of course, you wear them out quicker now, because you have heavier charges?—Yes.

18616. With regard to the cordite, was that generally satisfactory?—Yes, we had no complaints from our gunners.

18617. (*Sir George Taubman-Goldie.*) A good deal was

said in this country at the commencement of the war about the Artillery being sent out late, so that the horses had not time to recuperate after the voyage; is that your opinion?—I think so; I think it would have been better, in the light of what we know now, to have sent them earlier

18618. As a general rule, you think the Field Artillery and Horse Artillery should be sent out early, so as to allow the horses to recuperate after a long voyage?—I think so. I think it is always an advantage to be able to give

them a rest after landing, and at one time we did do that; some of those that were not wanted at once we sent to Maitland Camp for a week before sending them up country, and there is no doubt that had a great effect; but in the case of those that first arrived, owing to the strain, artillery were wanted without a minute's delay everywhere

18619. (Chairman.) Have you anything to add?—Nothing.

Major-General Sir G. H. Marshall,
K.C.B., R.A.
13 Mar. 1903

Colonel W. L. DAVIDSON, C.B., called and examined.

18620. (Chairman.) At what time did you go out to South Africa?—In October, 1899.

18621. With Sir Redvers Buller?—No, I went out with two batteries of Horse Artillery.

18622. Before the Army Corps?—On the 31st October, 1899. I left Birkenhead as part of the Army Corps.

18623. Where did you land?—At Cape Town, and we were sent up to De Aar and Orange River.

18624. What was your capacity?—I was commanding two batteries of Horse Artillery—a brigade division of Horse Artillery.

18625. What was your service after that?—The first thing that happened was that both batteries were taken away from me, and I was left alone, and after that I remained at Orange River Station doing nothing for a month. Then I was given a mixed force at Zoutpans Drift, to the west of Orange River Station, where we took the drift and the first part of the enemy's country—I believe it was the first occupation of the enemy's country—on the 6th January, 1900. I was kept there till February, when I went up to Modder River, and went with General Babington to Koodoe's Berg, and then I came back to Modder River and joined the Cavalry Division, which was formed, and went to Paar-deberg, Poplar Grove, Driefontein, and Bloemfontein. I was with the Horse Artillery along with General French's column.

18626. What were you in command of during that time?—For the first three days I was in command of the Horse Artillery on General French's Staff, but after that General French decided that he would have a staff officer for Horse Artillery, Colonel Eustace, who was eventually made Assistant Adjutant-General. I went back to General Broadwood's Brigade, and only commanded two batteries with him, but whenever the Horse Artillery were concentrated, as they were on two occasions, I, as the senior officer, took command of all the guns in action.

18627. And after Bloemfontein?—I was given command of "The Corps Troops" at Bloemfontein—a magnificent list of every arm and every sort of troop; but one thing after another was taken away from me, and I was eventually left at Bloemfontein with General Kelly-Kenny, and took over the command of the whole of the Artillery in the Orange River Colony, and remained under General Kelly-Kenny at Bloemfontein. After that I was sent up to command the line of communications at Krugersdorp, west of Johannesburg, but when I got there I found there were only two little bits of lines of communication left, and there were eight generals on and about them, and I had nothing to do there.

18628. You have been good enough to give us a précis of the evidence you are willing to give: will you put that in?—I will put it in.

Efficiency of Different Classes of Guns.

12 lbs. Royal Horse Artillery, good up to 2,500 yards, entirely dependent upon mobility, which they never possessed in South Africa, owing to being under-horsed, and bad horse and remount management.

12½ lbs. Vickers-Maxim, very good gun, but difficulty of ammunition supply, not being a service gun.

4·7-inch, 5-inch, 6-inch howitzers—all good, but require practical exercises to enable officers and men to use them to best advantage.

5-inch gun on railway truck—a valuable weapon.

The Adequacy of the Supply of Horses, Mules, and Ammunition.

No sort of system—advice of Commanding Officers, if consulted, seldom taken. No continuous work by the Department. At commencement of campaign constant changes in the personnel, hence "Stellenbosched." The

absolute dependence on an efficient Department for success in campaign not realised until best horses all dead.

Overcrowding on board ship, and no time given after landing to get horses' feet looked to, destroyed thousands. On the 15th February, 32 good horses in G. Battery alone unable to march on account of laminitis.

Horse Artillery and Cavalry not allowed sufficient halts. One sick horse in gun team kills the other five fit ones.

Ammunition supply good, in spite of the system never having been properly practised in peace time.

The Capacity, both Physical and Intellectual, of Officers and Men on Arrival.

All that could possibly be desired, but the services of the splendid body of Artillery officers not nearly sufficiently utilised for general Army purposes, Horse Artillery officers especially being not allowed to go on the Staff. Until very late in the campaign, no Artillery officer, except General Sir W. G. Knox, was used as a commander of other arms.

This is, in my opinion, a great loss to the efficiency of the Army, and most unfair on the officers of the Royal Artillery.

The effect on them of the campaign was to increase their fighting efficiency in every way.

Training of Officers and Men.

Nothing could be better than the past system of training. All that is wanted is a good class recruit, and, what is essential, large tracts of land where they can manoeuvre and shoot live shell.

Modifications in Tactics.

Horse Artillery, in order to be handled tactically to the best advantage, must have a commanding officer with a proper staff on the Headquarter Staff of a Cavalry Division.

In the Cavalry Division leaving Modder River on the 11th February, 1900, no such provision was made. All questions of concentration of fire, ammunition and remount supply were, therefore, never properly tackled.

Forty-two guns and three ammunition columns being a much larger and more important command than a Brigade of Cavalry should in such a case be commanded by a brigadier, at least, with a proper Staff.

Instances—March to Ramdam, Poplar Grove.

Bombardments:—Brigade Divisions should have orders to find their range on the objective, and then to fire for a few minutes at a time (given by the Commanding Royal Artillery) at uncertain hours, with occasional general fire. This would harass an enemy (especially one without guns) much more than a solemn general bombardment (with great waste of valuable ammunition) lasting for two or three hours at a time.

Instance—Paardeberg.

The Brigade Division system not adapted for war. Lieutenant-Colonels should be numbered, not the Brigade Divisions. Batteries should be self-contained units, but if necessary grouped under a Lieutenant-Colonel. Batteries proved themselves wonderfully uniform as regards efficiency.

Mobility the first thing. Guns are useless unless they can be brought to the tactical spot at the tactical moment.

Instances—Poplar Grove, Bloemfontein.

But the greatest tactical requirement of the Artillery is that the C.R.A. may have the means of concentrating the fire of as many guns as possible on the key to the enemy's position, at the psychological moment. It is impossible to do this by mounted orderlies, it must

Colonel W. L. Davidson,
C.B.

Colonel
W. L.
Davidson,
C.B.

13 Mar. 1903.

either be by telephonic communication with subordinate commanders, or by some unmistakable signal given from a central position, such as salvo of shell with coloured bursts, or signal rockets to attract attention, followed by salvos from a central battery, indicating the area of the enemy's position to be engaged.

18629. The first head is the efficiency of different classes of guns?—Yes.

18630. Have you anything to add to these notes with regard to the guns?—No; except that the Horse Artillery gun depends entirely on mobility which we never possessed in South Africa; the horses were never fit.

18631. Do you mean all the horses of the Horse Artillery?—They were never fit, because they were taken too soon off board ship to do hard work, and their feet never got the chance of being looked to.

18632. Does that apply to the earlier stages of the war, too?—More especially to the early stage—the very beginning.

18633. We have had opinions that some of the Artillery horses, especially those from the omnibus companies, were very good?—They were excellent if they had been given a fortnight or 10 days before they were started, but they did not get that, in my experience; they were landed at Cape Town, and two days afterwards they were sent straight into work.

18634. Was that the case with all the Horse Artillery that went up to the Modder River?—I think so.

18635. Some of them had been some time in the country, had they not?—The ones at Colesberg had had a good time; they had had time—those that were with General French.

18636. The two batteries you mentioned that went out with you must have had time, too?—No; those batteries, which were G and P, had very little chance. On the 11th December G was at Magersfontein, and P was split up into three sections on the line of communications between Orange River and Modder River, and they had no chance of getting their horses' feet really looked to. They were into hard work at once on hot sand, after standing on board ship for a month, overcrowded, and without having a chance of having their feet looked to.

18637. And that you consider affected the value of the Horse Artillery?—I consider that 10 days' cherishing of the horses on landing would have made us fit to do a year's campaign. I may say I expressed that opinion on landing.

18638. There has been some evidence that the range of the Horse Artillery gun was not sufficient for the purposes of the war?—Not for that particular country; of course, an unrestricted view and a clear atmosphere make all the difference, and they are quite sufficient for this country.

18639. You think the existing Horse Artillery gun is a sufficient gun?—The range is sufficient for this country; but, of course, a quicker firing gun would be better for this country. As regards range, it is quite sufficient for this and most European countries.

18640. Would a longer range not be better?—I think not, the view being so restricted. There are very few places in England that you can see 3,000 yards, while in South Africa you could see 8,000 to 10,000.

18641. We have been told that they intend to increase the range of the Horse Artillery gun. Will that not be an improvement?—Any increase of range that gives an efficient shell at the end of it will be an improvement, supposing the gun is sufficiently light to be mobile.

18642. Do you consider it light enough at present?—Yes.

18643. Do you consider the field gun could be so lightened as to make it mobile?—No; I do not think it necessary.

18644. We had one opinion, with which I suppose you do not agree, that the Horse Artillery gun ought to be discontinued and the field gun lightened sufficiently to be a mobile gun?—No; I think a light gun that can be brought to the tactical spot at the tactical moment is absolutely essential, and that can only be done by a very quickly-moving gun.

18645. And the field gun could never be made light enough to do that?—No.

18646. Did you see much of the heavier guns?—

Not in action; I had every sort of gun under my immediate command at Bloemfontein, but never in action.

18647. Have you formed an opinion as to their use?—Yes; I think they are all most useful under certain circumstances, properly used, especially the 5-inch gun on a railway truck; but what is required is what we never get, and that is the opportunity for practising with them in time of peace over a land range.

18648. It must be over a land range?—Yes; that is what we never can get in this country.

18649. Of course, the use of them at all with an army was a new thing in South Africa?—Yes; owing chiefly to the conditions of that country, which are unrestricted view, clear atmosphere, and hard ground, and which are not reproduced in Europe.

18650. You think the same conditions would not apply in Europe?—No.

18651. Would you not think that these heavy guns would be required in a European war?—Yes, but under totally different circumstances. They could not be taken along with bodies of troops, as in South Africa, and they could not be brought into action from any position against another position. They would have to be brought up for special purposes to special places under special conditions.

18652. I do not quite follow why?—On account of the softer ground and the restricted view. In South Africa you can get a range of fire almost in any direction, whereas in this country you hardly ever get an unrestricted view, and in the greater part of Europe you do not get an unrestricted view, as in South Africa, or a clear atmosphere always.

18653. But you could get them across the country?—I have doubts. For instance, the 4.7 gun, which I have a good deal to do with in this country, is perfectly hopeless, and even at the top of hills you very often cannot get it along on account of the softness of the ground.

18654. As to the supply of horses, the point you have already mentioned about working them too soon is the chief point?—That is the chief point.

18655. There was a sufficient supply of horses?—Yes; I think we should have had sufficient horses.

18656. What do you mean by "Advice of Commanding Officers, if consulted, seldom taken"?—I there refer to the advice of Commanding Officers, both with regard to what was required to get their horses fit for a campaign and what they would probably require in the way of remounts.

18657. Do you mean the Commanding Officers in South Africa?—Yes, the Commanding Officers of units.

18658. How would you have consulted them with regard to a question of that kind?—Whether their horses were fit to take the field, and whether they were fit to do a long march the first day; two short marches are easy, but one long march would kill all your horses the first day.

18659. I suppose the position was that the troops were wanted, and they had to be moved?—Oh, yes. I do not know anything about the strategical considerations. I am speaking purely from the point of view of Commanding Officers of units, as to what was required to make their horses fit for a campaign on landing.

18660. And you did not have sufficient halts?—No. Of course, the cavalry man, if anything is wrong with his horse, can stop and put it right, and get on again and canter up to his squadron, but if a horse in a gun is beginning to get wrong, unless you have a halt and you can take him out and put another one in, or readjust his harness, that horse will begin to hang back, and he will kill the other five horses in the team. I do not know that I am allowed to say exactly what I think, but I think that killed a great many splendid horses which with the best of horse-management would have done the whole campaign. We sometimes went for 25 miles with only two halts, whereas by trying more to halt where there was grass, and letting the horses get their heads down, we should have done the whole of that march without losing any horses. I had a year's experience of South Africa before this, and I am certain that we could have done that Kimberley march with the horses we had, if they had had five days' care to start with and if they had been halted where there was grass, and trotted down hill.

18661. Was that practicable under the conditions of the march?—I should think so.

18662. Do you mean you could have got to your destination as quickly under those circumstances?—Equally quickly.

18663. It was a mere question of arranging the day's march?—A question of management and proper use of the horses. If you trot through heavy sand you knock your horses up; if you trot up a steep hill you knock your horses up, but if you walk up a steep hill, and take advantage of the ground being with the collar—I am only talking of wheels, and not of cavalry horses—in that way you can save your horses so that you can do your work, and especially halting where there is grass instead of halting where there is no grass. The cavalry can crown the ridges, and the artillery might safely stop where there is grass, and walk up and rejoin them later, and trot down the hill to catch them up.

18664. Was that not allowable on a march?—I should say perfectly. When we were in South Africa before, in the Zulu war, we always halted where there was grass to get the horses' heads down, and the consequence was that the horses got fit.

18665. Was it not allowed on this occasion?—We marched with the cavalry and halted with the cavalry.

18666. If this happened, could the officer in charge of the artillery not have brought the fact to the knowledge of the General?—Well, of course, it was brought to the knowledge of the General, but they said the Horse Artillery must keep up with the cavalry, and so they can, but it depends on how you use them.

18667. As to this particular argument you have been putting before us, do you think that was not brought before the notice of the General?—It was.

18668. And he overruled it?—Practically, yes.

18669. Of course, he may have had reasons?—Of course.

18670. But the artillery position was stated to the General?—Yes.

18671. And there was an opportunity for the Commanding Officer of the artillery to make his representation to the General?—Yes, except that there was no Commanding Officer of Royal Horse Artillery on the Staff of the Cavalry Division, which, I think, there should have been.

18672. What was the position of the Officer Commanding the artillery? You are speaking of General French's march?—Yes. You understand I am not speaking personally in any way—I happened to be the senior officer of Horse Artillery there, but I am not speaking personally, and I only say that in order to give the Horse Artillery proper weight with the Cavalry Division. There never has been in the history of the British Army such a situation as having seven batteries of Horse Artillery with three ammunition columns attached to a Cavalry Division, but there was no provision whatever made on starting from Modder River for the Commanding Officer and Staff of the Horse Artillery as an integral part of that Cavalry Division.

18673. (*Sir Frederick Darley.*) Your opinion is that in marching with cavalry the artillery should give the pace?—Oh, no, not quite; they must keep up, at all risks, if necessary, for strategical purposes, but we can keep up. The cavalry must give the pace, but cavalry can often crown hills first, and they might let the artillery come up slowly, whereas we marched absolutely dressing with the cavalry all the way. It is a question of treating the wheels on the march according to the nature of the ground.

18674. (*Chairman.*) It is the position of the artillery with regard to the Divisional Staff that you want to call attention to?—Yes. I think, for the good of the Army, whenever a large Cavalry Division of that sort is formed, the Horse Artillery should have a definite position on that staff. It is laid down for a brigade, but there never has been a Division like the one that marched from Modder River to Kimberley, and there were no headquarter provisions made at all for a proper Commanding Officer and Staff for the Horse Artillery with the Cavalry Division.

18675. What is the position with regard to a brigade?—With a brigade there are only two batteries or one, and the Commanding Officer of Horse Artillery always rides with the Commanding Officer of the Cavalry, as commanding the Horse Artillery.

18676. And is on the staff?—And is on the staff, but in this case, on this Cavalry Division being formed, the Horse Artillery were passed over, I think, not quite

justly, because the Horse Artillery study cavalry quite as much as the cavalry study Horse Artillery, and there were Brigadiers of cavalry made; while officers far senior to them in the Horse Artillery, some of them with previous South African experience, were passed over. Lieutenant-Colonels of cavalry became Brigadier-Generals, while Horse Artillery officers were ignored altogether, and, in my opinion, the Horse Artillery are quite as able to command cavalry brigades as cavalry officers.

18677. You think that is a loss to the efficiency of the Army?—I think most distinctly so.

18678. You think very highly of both the men and the officers of the Royal Artillery?—As far as my experience of the war goes I cannot imagine anything finer than the men on landing. G Battery landed on 30th October, and at Magersfontein was 14½ hours under fire, the first time they were in action, and I think, if you read the account of it, you will see that no men could have behaved better.

18679. But you say the effect of the campaign was to improve them?—It made them much more handy, and taught them to cook, which is a most important thing for a soldier on service.

18680. To look after themselves?—Yes, to cook their own meals.

18681. Is that a thing they ought to be taught beforehand?—To a certain extent, if possible, but more by taking them out than by actually teaching them; you should take them out, and only let them have their food if they can cook it. The man on service who can cook is perfectly happy from morning to night, while the man who cannot is not.

18682. Otherwise you are satisfied with the system of training?—I think it is as good as it could be. I may venture to say that the battery system stood the strain of the war throughout from the beginning.

18683. And you are satisfied with the class of recruits you get?—No.

18684. The class of recruits you get develop into the men you say were so good?—Yes, through the training of their officers in time.

18685. Then it is a question of the time you can give for training?—Yes.

18686. With sufficient time you can make a good man out of the class of recruits you get now?—Yes, the class of men you get for the Horse Artillery.

18687. Is that a different class?—Yes, selected men on rather increased pay.

18688. You are speaking of the Horse Artillery?—Yes, with regard to being satisfied with the training. I am not satisfied with the class of men you get for the Field Artillery.

18689. But the Field Artillery also did very well?—Yes, at that time; they had had a long previous training, and they had a great many very fine Reservists to begin with.

18690. How long do you think it requires to make a good artilleryman?—It depends entirely upon the man.

18691. Taking the average?—With the class of recruit we get, as a general rule, it takes three years.

18692. For the Field Artillery?—Yes.

18693. And the Horse Artillery?—The same, or rather less, because you get a better class of man. That, of course, depends upon the facilities he has for being taught. At present he has hardly any in this country, only at Salisbury and at Okehampton. There would be no greater economy in teaching men for a war like this than having more land ranges, where they could fire with live shell. The climatic conditions of Okehampton are very bad, and Salisbury, of course, is not an ideal training ground either.

18694. In what respect are the climatic conditions of Okehampton bad?—It is nearly always misty and rainy; the rainfall is enormous.

18695. (*Sir Frederick Darley.*) And you can see a short distance only?—Many days you cannot work at all; many days in the year are lost entirely, owing to the weather.

18696. Do you pick your men for the Horse Artillery?—Yes.

18697. (*Chairman.*) You think there ought to be a discretion to brigade divisions about the mode of firing?—I do not think I have said that.

18698. Will you explain what those words mean after

Colonel

Colonel
W. L.
Davidson,
C.B.

13 Mar. 1902.

"Instances—march to Ramdam—Poplar Grove—bombardments"?—The instances there mentioned refer to the previous paragraph; with an enormous command like 42 guns and three ammunition columns there was no Commanding Officer on the Headquarters Staff, and it was a question of concentrating the guns at one time. The march to Ramdam was a question of trotting them through certain ground. I think, if the Commanding Officer of Horse Artillery had had his proper place on the cavalry staff, one could have said, "It is impossible for wheels to be trotted through the particular piece of ground they are on now, let them walk through that and trot afterwards."

18699. It is part of the same question you have referred to already?—Yes, when we are marching in column with them the head of the cavalry column gets the word to trot, and the ground where they are may be excellent, but the ground where the whole of the seven batteries of horse artillery with all their wagons and ammunition columns are may be heavy sand; that is what kills horses, and all that requires judgment. For instance, if those guns and wheels had been allowed to march for another half mile, and then to trot up and rejoin the cavalry, the horses would not have been nearly so exhausted. I am only pointing out the advantage of having a man on the cavalry division staff who can speak with authority—a man with a definite position.

18700. That was the point you made before?—Yes, it is under the heading of "Modifications in Tactics"; you will never get the best tactical work out of horse artillery until you have a man on the headquarters staff of the Cavalry Division who can speak with authority.

18701. But, surely, if the column was ordered to trot and the Artillery at the time were in sand, they would not trot, would they?—They were bound to at that time; you march as a column, and you are bound to keep up.

18702. If you look at "Bombardments," do you not suggest that the Artillery should select the manner in which they were to use their guns there?—No; with regard to bombardments, my instance was Paardeberg. What I mean is that, instead of the whole of the guns bombarding steadily for two solid hours at a time, it would be a great economy of ammunition and much more harassing to the enemy, if they got orders from the Headquarters Staff (Commanding Royal Artillery) to bombard a place, that they should find their range first of all and then get orders issued to them that such and such a brigade division will fire from 1.32 to 1.35, another will fire from 1.39 to 1.45, and so on, and with an occasional salvo from all the guns. In that way the people who are being bombarded would never know at what time it was going to begin or at what time it was going to cease, and it is much more harassing, and would save an enormous amount of ammunition. That is the only reason why I put that down. Instead of firing all your guns for two hours, which is an enormous waste of ammunition, and makes the enemy take cover until it is finished, it would be much more harassing for the men you are firing against if you fired for two or three minutes at unknown times ordered by the Headquarters Staff, day and night.

18703. But the practice was to fire all together?—I think so.

18704. You desire that they should concentrate the fire at the proper time?—By definite orders of the Headquarters Staff, at uncertain intervals.

18705. Is there any other point you wish to call attention to?—There is only that last thing—which I think is the most important thing of all—as regards the tactical requirements of artillery in future; that is, that the Commanding Royal Artillery may have the means of concentrating the fire of as many guns as possible on the key to the enemy's position at the psychological moment. That is what we wanted all through South Africa. In these big extended fights we want that the Commanding Royal Artillery may be able to indicate the actual point of attack, and that every gun that is not engaged on private business, so to speak, may be turned on to that point at that moment. If you trust to gallopers for carrying orders, they may get lost, and the moment is lost; it is a question of a moment, after three or four hours' extreme strain, and with a little ingenuity we could get some way of arranging to call attention to certain salvos, which would indicate the position the infantry are about to attack, and you could concentrate every gun on that point at the moment

simultaneously. These are things that only happen at the moment; you cannot send orders for miles, and I think if there is to be any change in artillery tactics that is all that is wanted—that the Commanding Royal Artillery should be able to indicate the point where the General Officer Commanding the forces is about to push in, and to indicate that in such a way that every gun available may be turned on to that point at that moment.

18706. There is nothing of that kind now?—No.

18707. It is all done by gallopers?—Yes; and, of course, some of them may not get in until evening. It can only be done by telephone or signal.

18708. Is that practicable in the course of an action?—The telephone in a defensive action would be feasible, but do not think that any offensive one, which is the important one for concentrating fire on the point you want to attack.

18709. I think we heard that in Ladysmith there was a great system of telephones?—Yes; that is. on the defensive.

18710. That would be on the lines you mean, probably?—Yes; but I think the signal is better for the offensive; it only wants arranging. I am told there is a difficulty about the coloured shell. The coloured shell is Mr. Winston Churchill's idea; he gave it me at Bloemfontein. I only mention that to show that it is not an original idea. But there is a difficulty about the coloured shell—that they cannot make any explosive that will burst with a definite colour; it always comes white.

18711. (Sir John Hopkins.) That is by daylight?—Yes.

18712. (Chairman.) Is there any other point?—There are one or two points of detail which I think very important, and which are not on this paper. One is that there should be a general army signal for standing at ease or marching easy, and the reason I venture to bring this forward is that I have seen so much of it in war. It arises when men are lying about tired in camps, and so on; but sometimes men are not tired, and they ought to get up and salute an officer as he passes, or stand to attention. At other times men are dog-tired after a march, and it is still their duty to do so; and some good regiments struggle to do it. But what I venture to suggest is that there should be some army signal, so that officers going through the platform of a railway station, or anything of that sort, or a tired camp, could be able to unswitch the men. I have used it myself, unofficially—simply an army signal for stand at ease or march easy, so as to be able to unswitch men whose duty it is to do certain things, because it is impossible to keep up discipline if they are ordered to do a certain thing and they do not do it. Sometimes it is because they are really tired, and at other times it is because they are slack, whereas if an officer had the power of signalling that they were unswitched from attention he could use his own judgment.

18713. Each individual officer might make the signal?—Yes; and the men, instead of struggling to their feet to salute, are unswitched from attention. It is a mere detail, but I am sure it would have a good effect with regard to discipline. The other thing is with regard to discipline. My experience of this war and other wars I have been in is that you cannot have discipline with mixed bodies as we have unless officers have some power of summary punishment on the spot without reference to anyone.

18714. (Sir George Taubman-Goldie.) What do you mean by summary punishment?—Either shooting or sending out on to the veldt; taking his arms and sending him off.

18715. (Chairman.) Dismissed?—Yes. I remember, in Zululand, an Eton boy who was a trooper being sent off straight away into the country among the Kaffirs, and the army marched on without him.

18716. (Sir Frederick Darley.) Was not that rather a cruel thing to do?—Yes, but war is cruel, and you often save thousands of lives by doing that.

18717. Would it not be better to shoot him than to perpetrate such an act of cruelty?—I think nothing saves lives better than shooting a few.

18718. (Sir George Taubman-Goldie.) Would it not be better to revive flogging in war time than to do that?—It would be better, but you must have some power of summary punishment. There have been so many in-

stances in this war where young officers have been given mixed bodies of troops, sometimes in the dark, at a railway station, and they have been asked to protect a convoy with those troops. They have ordered these men to march half a mile from the edge of the convoy, and they have disobeyed, and gone to sleep on the wagons, and then you read in the newspapers afterwards that a convoy has been attacked, and that it is the officer's fault. The young officers have no power whatever, and they had much better stand or fall on their own responsibility. In a good regiment the moral power keeps the discipline at its very highest possible degree for war; but it is a very different thing when officers—as has happened in thousands of cases in this war—are handed over a body of men they have never seen before

and are ordered to march with a convoy in the dark. Unless such an officer is given a power of summary punishment, I fail to see how he can insure the discipline which would insure the safety of the convoy.

18719. (*Chairman.*) Are you speaking of Regular Troops?—Yes, any sort of troops.

18720. We have had some evidence with regard to irregular troops—that some of them were enlisted with that particular condition—the men enlisted knowing that the commanding officer had the power of dismissal?—A very good thing, too; so do ours, because it says in the Articles of War that if a man sleeps at his post on active service he shall be shot.

18721. But not dismissed?—No.

Colonel
W. L.
Davidson,
C.B.

13 Mar. 1902.

(After a short adjournment.)

Brevet-Colonel R. L. HIPPISELEY, C.B., R.E., called and examined.

18722. (*Chairman.*) When did you go to South Africa?—I arrived in the country on the 10th December, 1899.

18723. Did you go out with Sir Redvers Buller?—I did not. I went out afterwards. The original Director who was appointed for Sir Redvers Buller's Army Corps died on the way out, and I was appointed to replace him.

18724. As Director of Telegraphs?—As Director of Telegraphs.

18725. And you held that position throughout?—Throughout the campaign.

18726. Where were your headquarters?—To begin with, Cape Town, and then afterwards Bloemfontein, and then eventually Pretoria. I remained in Pretoria from the time Lord Roberts arrived there until the end of the campaign—after the conclusion of peace.

18727. You have been good enough to draw up a paper of the heads of the evidence you propose to give. You have no objection to that being put in as your answer to the first question?—No.

I. The Army telegraphs were used for:—

(1) *Lines of Communication Telegraphs*—viz., those connecting Pretoria, Bloemfontein, etc., with Cape Town, Durban, and the various principal centres in the new colonies, etc.

(2) *Temporary Field Lines* connecting the various divisions, columns, etc., with the Commander-in-Chief, and with each other.

(3) *Telephone Exchanges* at various centres for administrative or tactical purposes.

(4) For keeping the *Blockhouses* in communication with one another, and with the commandants of sections.

II. To give an idea of the relative magnitudes of (1), (2), (3), and (4) the following figures are given:—

Miles of wire run under—

- (1) 1,146 + 9,395 taken over.
- (2) 5,940
- (3) 1,789
- (4) 9,361

18,236 + 9,395 existing.

Telegraph offices opened under—

- (1) 252, working 504 instruments.
- (2) 872

1,124

Telephone exchanges, 60, having 1,527 telephones.
+ 23 minor exchanges.

Telephones in blockhouses, 1,945.

Staff on 31st May, 1902:—

Officers	-	-	-	-	21
Non-commissioned Officers and	-	-	-	-	
Men	-	-	-	-	1,094
Civilians	-	-	-	-	392
Natives	-	-	-	-	918

2,425

Messages forwarded	-	-	4,040,723
received	-	-	3,803,034
transmitted	-	-	2,866,011

72c.

This represents 13,575,779 transactions.

The cost of the messages sent for the Army works out at 3d. per word. Usual Colonial rate is 1d. per word.

III. The noticeable and novel feature in the recent war was the extensive use made of field cable lines, of which 3,749 miles were run.

IV. The existing telegraph system of the country was in most places almost completely wrecked by the Boers, and had to be repaired. It suffered from their depredations continually throughout the war, as it was impossible to prevent their raids until the system of blockhouses was completed. After this communication became secure.

A large and important section of the Transvaal telegraphs—namely, that by which all the Transvaal traffic used to circulate before the war—never fell into our hands until the conclusion of peace. Consequently there was always great pressure on the wires that were available, as the Transvaal traffic was very heavy. The same applied, in a modified degree, to the Orange River Colony traffic. These circumstances rendered necessary the running of some of the wires mentioned in (1) along the routes that were protected. The remainder of the wires in (1) were necessitated by the occupation of otherwise unimportant places by columns and troops, which places were either without telegraphs or else inadequately provided for the extra strain.

V. The aim was to provide every moving body of troops with detachments of the Army telegraphs, to enable them to preserve their connection with the Commander-in-Chief by means of light field lines or cables. This was done in most cases, but it was found impossible to do so in all. Firstly, because each division of infantry, or its equivalent, requires a "section" of telegraphs, and there were in 1900 fourteen divisions, including cavalry and mounted infantry, and only eight sections. Secondly, because there was not originally any effective organisation for the lines of communication telegraphs mentioned in (1), and as these were of primary importance, many men, even of those belonging to the eight sections, who ought to have been available for (2) had to be withdrawn for (1). And, thirdly, because in the later stages of the war the columns moved in such tangled tracks that anything like a telegraph following them was an impossibility and unprotectable. In many such cases all that could be done was to provide the columns with a few telegraph men to enable them to communicate whenever they came within reach of some existing line. Generally this was sufficient.

VI. In spite of the above drawbacks, many divisions and columns were kept constantly in communication with the Commander-in-Chief, even when they proceeded to places out of reach of the permanent telegraph system, and in addition a large amount of inter-communication between the component parts of separate commands was afforded.

VII. The telephone exchanges were most useful. They are a most important, if not indispensable, adjunct to war administration. They were used to connect together fortified posts with commandants of places, and also to afford inter-communication between departmental heads. The former needs no justification. The latter, in extended operations like the recent campaign, is also very important, as in such cases not only is the sub-

Brevet.
Colonel R. L.
Hippisley,
C.B., R.E.

Brevet-
Colonel R. L.
Hippisley,
C.B., R.E.

13 Mar. 1903.

division of administrative responsibility necessarily more complete, but also the various departmental heads are more scattered, and telephone exchanges save much valuable time.

VIII. Every second or third blockhouse was provided with a telephone, both for the communication of orders, the dissemination of information, and to ensure co-operation in case of attack.

IX. Organisation.—In 1899 the Telegraph Battalion consisted of two divisions, viz.:—

(a) The 1st Division with a light equipment intended for the construction of the light field lines described in (2).

(b) The 2nd Division, who work on the permanent telegraph system of England under the Post Office.

During the war a 3rd Division (c) was organised at home, also intended for the duties described in (2).

On mobilisation for war two units, which, by a strange confusion of nomenclature, are called "Telegraph Divisions," are formed out of (a) and (b). These units are intended and considered sufficient for two Army Corps for duties described in (2).

In 1899 there was no organisation for the duties contained in (1).

Unit (c) is intended for a third Army Corps for duties (2).

This organisation is faulty, and should cease. The following should be substituted:—

Unit (a), which possesses equipment for two Army Corps, and together with (b) sufficient personnel for two Army Corps, should be divided into two units, one for each of the two Army Corps for duties (2). Unit (c) will then perform these duties for a third Army Corps, while unit (b) should provide the organisation needed for duties (1). This will obviate the confusion described in Paragraph V. of this summary. I consider it most necessary.

Secondly. The Telegraph Battalion has no head or commanding officer, and consequently there are many details of training, and a conflict of interests between the peace divisions which are not satisfactorily dealt with. It requires an officer with a considerable amount of experience and of technical knowledge to keep the organisation on a sound footing. It would, I think, be best that this officer should be on the Headquarter Staff in order that the allocation of units (a) and (c) to the Army Corps to which they belong should be complete. His title might be "Director of Army Telegraphs." His duties would include:—

The co-ordination of peace training.

General supervision of the training for war of unit (b) (now somewhat neglected owing to the stress of the demands made upon it by the Post Office).

Responsibility for reserve stores.

Posting of recruits.

Registration of Reservists.

Arrangements for interchange of personnel between units (a), (b), and (c) (very necessary in order thoroughly to complete their peace training).

Responsibility for improvements in technical stores.

General advice to the War Office on telegraph matters.

Responsibility for the collection of information regarding the existing telegraph systems of countries which might be possible theatres of war.

Etc., etc.

X. During the war the following drafts were sent to South Africa:—

One section for Sir George White's army in Natal.

Four sections with Sir R. Buller's Army Corps.

Three sections as reinforcements soon after Lord Roberts assumed command with an increased army.

Late in 1901 two more sections were sent.

Various drafts arrived at various times.

Many men from other regiments who had a knowledge of telegraphy were attached to the Army telegraphs, and a considerable number of civilians were engaged.

The actual organisation of the work of these sections had to vary according to the changing conditions of the campaign, and in correspondence to the gradual enlargement of the area under administration.

The eventual arrangement was as follows:—Assistant Directors were appointed—one for the Transvaal, one for the Orange River Colony, one for Cape Colony, and one for Natal. They were responsible to the Director for all the telegraphs within their own Colonies, whether

for lines of communication or for mobile columns. For these purposes they each had men engaged in permanent telegraphs and mobile detachments with cable and air line. The financial arrangements were concentrated at Bloemfontein and Pretoria.

XI. Material for telegraph work was obtained both through the Army Ordnance and also by local purchase, in the proportion of £88,851 to £69,359. Local purchases had to be resorted to in many instances when the demands were very pressing, as there was naturally more delay in the other method, and wants could not always be foreseen. A considerable amount of material was found in the country, belonging to the Governments of the Republics, and was utilised.

18728. As Director of Telegraphs what position did you hold; what was the exact definition of your position as Director of Telegraphs?—I had control of all the telegraphs in the theatre of war, including those that we found in the country, many of which were very much destroyed, and had to be repaired; also all telegraphs that were erected for the Army by the Army Telegraph. I was on the Staff of the Commander-in-Chief, and I took his instructions as to what telegraphic communication he wanted, and, as well as that, I carried on myself what I thought was right.

18729. You were on the Staff?—I was on the Staff of the Commander-in-Chief.

18730. With direct communication with the Commander-in-Chief?—Yes.

18731. And what staff had you?—It varied, of course, at different times of the war, but at the conclusion of the war I had 21 officers, 1,094 non-commissioned officers and men, 392 civilians, and 918 natives, making a total of 2,425.

18732. What part of that was part of the regular organisation before the war for the Telegraph Department?—Only a small proportion of it. I think the strength of the telegraph battalion, out of which the nucleus of this was formed, was not more than about 400 men, I should say, but I could not be perfectly certain—400 or 500 men.

18733. That was the regular organisation, a part of the Army organisation?—Yes.

18734. That was what you went out to direct in the first instance?—Yes.

18735. But it was inadequate for the purposes?—Quite inadequate for the purposes.

18736. And how was it supplemented?—It was supplemented by special enlistments made at home, civilians engaged in South Africa, the loan from other regiments of a considerable number of men who understood telegraphy, and a few transfers from other Royal Engineer companies. The drafts that came from home from time to time were considerably in excess of the original strength that belonged to the peace organisation; they were raised, I think, chiefly by special enlistments, and a great many men were got from the Post Office from time to time. But the exact source of all I cannot tell you for certain.

18737. But, looking at the experiences of the war, do you think that the strength of the organisation of this branch was satisfactory?—I think the organisation was satisfactory, except in regard to a single point, which I have enumerated in this summary. I do not think that it is a good thing for the first division of the telegraph battalion to have to supply the telegraph units for two Army Corps. I think that it ought to be sub-divided into two units in peace time, so that each Army Corps should be provided with its own units. There are three divisions in the peace unit. The second is employed on Post Office telegraphs in the South of England, and it is intended to be amalgamated with the first on mobilisation, and out of the unit so formed two are made, one of which goes to one Army Corps and the other to the other Army Corps. I think that is a mistake. I think there should be three mobile telegraph divisions; that is to say, I think the first division, as it at present exists, ought to be divided into two units, and then the second division, as it now exists, would form the personnel for the lines of communication telegraphs. There would then be three mobile units, one for each of the first three Army Corps, plus the organisation which could undertake in time of war the lines of communication telegraphs. When the war first broke out there was no satisfactory organisation for the lines of communication telegraphs, and one had to be extemporised, and, in doing so, a very large number

of the men who ought to have been doing field telegraphs with the mobile columns had to be taken from their proper work and utilised on the lines of communication telegraphs, because the lines of communication telegraphs were really of far greater importance than the field telegraphs, inasmuch as all the correspondence with England had to go that way; and I think that the Commander-in-Chief was more anxious to preserve an efficient telegraph to Cape Town and to England than he was really to preserve his connections with his various divisions; at all events, only a certain proportion of the mobile units and divisions were able to be supplied with telegraphs connecting them with the Commander-in-Chief, on account of the large withdrawals that had to be made from the mobile units, in order to do the lines of communication telegraphs.

18738. The general line from the front to Cape Town, you mean along the railway?—The general line from Pretoria and Bloemfontein down to Cape Town, and also in connection with the principal military centres. There was a system of what might be described as permanent telegraphs, connecting Bloemfontein and Pretoria with Natal, Durban, Cape Town, and all the principal places intermediate, Naauwpoort, De Aar, and so forth.

18739. Those were all along lines of railway, were they not, almost all of them?—Practically they were; we tried to use some of the cross country lines for the purpose, but, in consequence of the continuation of the guerilla warfare, those lines were never very effective to us.

18740. But had not those places along the lines of railway a service already existing beforehand?—They had a service before the war, but when we arrived there that was entirely disorganised, and the people who worked it were many of them fighting against us; at all events, it was all in a state of confusion, and many of the lines, the majority of the lines I should say, were broken.

18741. Of course, there was a great deal of repairing to do?—Yes.

18742. But I should have thought you would have got a good many of the employees?—We got a certain proportion of them, but most of them we could not take, because we did not consider them reliable.

18743. You carried on the whole of the telegraphic system for Army purposes, railway purposes, and everything, did you?—I did for all, except the railway. The railway had certain wires of their own, which they worked and kept in order, because the Director of Railways considered it was desirable that he should have them working directly under him.

18744. They had separate wires and a separate staff?—They had separate wires and a separate staff, although their wires ran along the same poles as the Army telegraph was using.

18745. Was that through the Free State?—Through the Transvaal and the Free State.

18746. Not the Cape Colony?—No, because the Director of Railways had nothing to do with Cape Colony. That was worked, of course, by the Cape Government Railways; they had their own system.

18747. But had you a separate system right through Cape Colony for Army purposes?—No. We practically handed over all our telegrams to the Cape Colony service at De Aar at first, and afterwards at Kimberley, and they took them on. But towards the end of the war, for the last year of the war, I think, we had a direct line to Cape Town, of which the southern portion was kept in order and maintained by the Postmaster-General of Cape Colony; that is to say, we did not hand over at the end of the war all our messages at Kimberley or De Aar, we sent some of them straight through to Cape Town.

18748. Through your own wires?—Through a wire that was partly ours and partly the Cape Colony's; that was the arrangement with the Postmaster-General.

18749. But over which you had control?—I had only control over the northern half of it.

18750. In addition to these lines of communication telegraphs, you had the temporary field lines?—Yes.

18751. You say that was not kept up with all the columns?—Not with all the columns, but a great many of them. It was not kept up, in the first instance, in consequence of there being so many men required to be withdrawn from the field units for the purposes of the lines of communication, and at the last part of the war it was practically impossible to follow up all the

columns with telegraphs, because they did not keep connection with their base, I mean with the point of starting. They went with so many days or weeks' supply, and moved about in the area in a tangled sort of way, so that it was impossible to run the telegraph to them, or to keep it going, and in that case what was done was to provide them with a certain number of telegraph men, telegraph operators, who connected them with any existing telegraph line that they came near. And really, for the most part, that sufficed; at any rate, the Commander-in-Chief saw that it was impossible to do anything else, and I think he was content with that.

18752. Was there a temporary line following up all the advance on Bloemfontein?—There was a temporary line run from Enslin to Bloemfontein, following up Lord Roberts' march, and, in addition to that, there were certain temporary lines laid out, which followed the march of flanking divisions, one on each side of Lord Roberts; and there was a line run to connect up the Cavalry Division from a place called Osfontein, which went out to the left of the general advance, and kept the communication for some distance, I think, about 30 or 40 miles. But there was one line right from Enslin to Bloemfontein for Lord Roberts, and, in addition, there were certain branches going out to the divisions, and so on, on the flanks.

18753. And in the same way on the advance from Bloemfontein to Pretoria?—Yes.

18754. With columns like General Ian Hamilton's column?—General Ian Hamilton's column was kept in communication from the time he left Thabanchu until he arrived at Kroonstad, during which time he was making a parallel march with Lord Roberts on the right. He was kept in communication the whole way. Thabanchu was also in communication with Bloemfontein by the permanent wires which already existed, so that General Ian Hamilton was in communication with Lord Roberts the whole time, I may say, during that march.

18755. What happened to that temporary line afterwards, because that country was subject to raids by the Boers, was it not; was it abandoned?—Yes, it was abandoned. It served its purpose for a time, and then, when General Ian Hamilton came to Kroonstad, there was no further need for it.

18756. It was simply abandoned?—Yes.

18757. And how about telephones?—We had a very extended telephone system. We had 60 telephone exchanges, having 1,527 telephones, and 23 smaller exchanges with about only two or three branches each. I consider that those telephone exchanges were extremely important in affording great facility for intercommunication between members of the Staff, heads of departments, and so on, during the time when they were more or less stationary at Pretoria and Johannesburg, and also they were of great use in connecting military posts with the commandant of the place.

18758. They were only in individual stations, was that it?—Yes, they were local telephone exchanges in many cases, connecting the commandant of the place with all his outposts and various forts and things. That was very noticeable in Ladysmith, where they had a very extensive system of telephones to all sorts of places round about Ladysmith, and I believe Sir George White was quite of opinion that it was of immense importance to the defence of Ladysmith.

18759. Yes; we had some evidence about the existence of that system there?—Then, of course, there was a very large exchange in Johannesburg, which we found in existence, and which we took over and worked so far as it was of use to us, and we added to it; and also there was a large telephone exchange in Pretoria, which we also took over and added to; in fact, there were two exchanges in Pretoria.

18760. That system would only be of use either for a defensive position or for a large station?—Yes, that would be so.

18761. With regard to the block-houses, what was the communication between the block-houses; was it telegraphic or telephonic?—It was telephonic; about every second or third block-house had a telephone, and the block-houses were all connected together by a telephone wire, so that a certain block-house could communicate with the Commanding Officer of the section what was going on there; they could also telephone for assistance if it was necessary. I believe the system worked extremely well; at all events, I never had a single com-

plaint; it was just worked by the men who garrisoned the block-houses.

18762. You give in your summary statistics about wires used for messages, and so on; you bring out the cost to $\frac{1}{2}$ d. a word?—The cost of the messages sent for the Army comes out to $\frac{1}{2}$ d. a word, which is extraordinarily cheap.

18763. How was that brought out?—By striking a balance between all the expenses and all the receipts.

18764. (*Sir George Taubman-Goldie.*) Soldier labour; do you include that?—Yes, I include everything. I include pay and engineer pay and the pay of natives, rations, forage, casualties amongst horses, everything I could think of; and on the other side all the receipts. It is a little astonishing, but you must remember that there was a considerable amount of material that we found in the country. I should not like to say exactly how much, but I should think very nearly £80,000 or £90,000 worth, a good deal of which we used.

18765. What kind of material was it?—Telegraph material, wires, poles, instruments, batteries, and every conceivable thing, chiefly in the Transvaal, and a certain amount in the Orange River Colony, so that really is one reason why the expenses were so small.

18766. (*Chairman.*) What do you mean by receipts?—We accepted money for certain messages—from anybody who sent a private message—provided it was passed by the censor.

18767. And deducting that from the expenses brings out $\frac{1}{2}$ d. ?—Yes; and then, also, we received a considerable amount of money on the conclusion of hostilities by the sale of stuff that we had erected. We handed over to the Colonial Governments a very large amount of stuff, amounting to—I could not say for certain, I have not the figures here—but I should think nearly £70,000 of stuff. We handed over to them the lines which we had erected, for which the War Office had provided the material, either in the shape of stores from England or stores elsewhere obtained by local purchases.

18768. I think you have dealt mostly with page 1, have you not, of your statement?—I think so.

18769. Page 2 begins with, "IX.—Organisation," and the first paragraph of that you have also dealt with?—Yes.

18770. With regard to the second paragraph, you think there ought to be some head or Commanding Officer of the telegraph battalion?—I think it is a great defect in the present organisation that there is no responsible officer at the head of the telegraph battalion in peace. There is an officer commanding each division of it, but at the same time there are certain conflicting interests between the divisions, notably between the first division and the second division in regard to the supply of men and the training of men for war, which an officer at the head of all the three divisions would be able to deal with. I think also that he should be responsible for the reserve stores, of which there are a very large quantity kept in peace at Woolwich.

18771. You want somebody on the Headquarters Staff?—I think it would be better, because the First Division and the Third Division are intended to provide the telegraphs for three Army Corps, and in order that those Army Corps should be complete, these divisions ought to go to them, not to be kept together.

18772. (*Sir George Taubman-Goldie.*) Is there not a division attached to each Army Corps at present?—No, there is not; they are all at Aldershot. There is the First Division there and the Third Division.

18773. Is there no division at Salisbury Plain at all?—Not at present; and there are a lot of things for which an officer at the head of the whole is wanted. Amongst other things, I think I mentioned the interchange of personnel between the divisions. It is very desirable that all the men in the Telegraph Battalion should have a chance of serving in each of the three divisions; at all events, in the first and second or in the third and second, in order to complete their training, because the training they get in those units is different.

18774. (*Chairman.*) How is each division commanded now?—There is a Major in command of each division; at least, there is a Major in command of the First Division, and there is a Major in command of the Second Division, and there is a Captain and Brevet-Major in command of the Third Division. My opinion is that the First Division should be divided into two, and there

should be a Commanding Officer for each of the divisions of the first and third, and also the Second Division, and that the whole thing should be for the purposes of co-ordination under a Director.

18775. Have you no command at present in the Telegraph Division?—At this moment I have none. I am simply attached to the Home District.

18776. For telegraphic purposes?—For the purpose of attending committees, chiefly on telegraphs. I am a member of the Committee on the Telegraphic Organisation.

18777. In this organisation of the Telegraphic Department there is no place for you at present?—No.

18778. You mention at the end of that paragraph the responsibility for the collection of information regarding the existing telegraph systems of countries which might be possible theatres of war. Is anything of that kind being done at present?—I am not aware of it. I suppose the Intelligence Department do that; but my contention is that they are not the right people to do it. I think the head of the telegraphs ought to do it.

18779. At present there is no organisation in the Telegraph Department to do it?—No.

18780. Obviously, it would be a great advantage in regard to many countries if you had information beforehand?—We ought to have charts of every telegraph in every country that is a possible theatre of war. We ought to have the charts all ready to hand, and also we ought to have information regarding the resources of the country from the point of view of material.

18781. You had not any information of that sort regarding South Africa when you went out?—The Postmaster-General of Cape Colony did forward some charts. Personally, I do not think I got them until I got out to South Africa; I will not be perfectly sure of that.

18782. (*Sir George Taubman-Goldie.*) Charts of the Republics, do you mean?—Charts of the telegraphs in South Africa, including the two Republics. They were very incorrect as regards the two Republics. They were all right as regards Cape Colony.

18783. (*Chairman.*) Did you have any information about material?—None.

18784. That you gathered for yourself afterwards?—Yes; and I am not sure whether the information was forthcoming in England. I mean to say it was quite possible, that if I had applied to the right man in the War Office, I might have got some information; but I certainly did not know who he was. I daresay somebody had the information; but it was not forthcoming.

18785. With regard to the different sections, in the next paragraph I think you have spoken as to the details?—Yes. I may say, in regard to sending out one section for Sir George White's army in Natal, that I consider it very absurd to send out a small detachment of telegraphs like that (I think there were only 55 men all told), considering the force that Sir George White had.

18786. (*Sir George Taubman-Goldie.*) How many officers were there?—There was a major, a captain, and a subaltern. There were four sections with Sir Redvers Buller's Army Corps. Four sections were considered to be sufficient for an Army Corps. So they are. But then almost immediately after that the Army increased enormously until it practically comprised the same numbers as five Army Corps, I think, pretty nearly, and all told we had only then got eight sections, which were absolutely insufficient, because the two sections alluded to in the last part of this paragraph did not arrive until just before the conclusion of the war. If one had known that the war was going to end, of course, one would not have asked for them.

18787. (*Chairman.*) That was why you had to supplement them in the way you described at the beginning?—Yes. The actual organisation of the work out there varied very much from time to time, as can be easily understood, because the circumstances changed so completely. In the first place, at the beginning there was a very small field, from the telegraphs point of view—we had very little to do. Then it gradually increased, until it comprised the whole of the two new colonies, and the area under administration was very big; so that the organisation had to be varied from time to time in order to fit these

different conditions; but eventually the organisation arrived at was that each colony had its own assistant-director, who was working under the director, because the country was really too big to be administered centrally, and it was much better to make these assistant-directors responsible to the director, and let them administer all the telegraphs within their own colony. These assistant-directors had entire control of the telegraphs, whether they were wanted for mobile purposes or for the lines of communication.

18788. And all the financial arrangements were at Bloemfontein and Pretoria?—All the financial arrangements were at Bloemfontein and Pretoria. The financial arrangements were really very simple; but, of course, they involved very considerable sums of money. Originally the financial arrangements were all concentrated at De Aar, at the beginning of the campaign. Then after the Orange Colony was occupied more or less completely, the whole of the financial arrangements, and what is called the clearing house, was moved from De Aar to Bloemfontein; and then, after the Transvaal was occupied, it became necessary to organise another financial branch in Pretoria, and the branch at Bloemfontein was left there, so that there became two.

18789. Were all those under your direction?—Yes.

18790. Do you think they worked well, financially?—Yes, I think so. I think the financial arrangements were very good.

18791. Your material you obtained partly locally and partly from home?—Partly locally and partly from England, through the Army Ordnance.

18792. Did you experience any difficulty in getting the material you wanted?—I cannot say that we had really very much difficulty. Of course, the local purchases were more expensive than those got through the Army Ordnance, at least so far as I know. I do not know, of course, what the transport cost out to South Africa; but I gather that they were rather more expensive, I should think about 5 per cent. or 3 per cent. more expensive purchased locally; but there was no doubt that we got them quicker by getting them through local agents.

18793. What sort of material had you to purchase locally?—Wire, to a large extent copper wire, and telephones chiefly.

18794. You could get those locally?—We could get copper wire locally; the merchants were importing it in large quantities to meet our demands; they foresaw what we should want, more or less, I think, and, towards the latter part of the war, they used to import large quantities of this stuff and sell it to us.

18795. Might that not have been foreseen from the Department here?—No, we could not foresee much. We did not know which way the thing was going to work, and the blockhouse system, which caused an enormous drain on material, was absolutely unforeseen, so far as I know. I had no idea that they were going to have this enormous system of blockhouses.

18796. And how did you purchase—by contract?—We purchased through an agent at Durban chiefly. We purchased a large quantity of telephones through a Durban agent, and also a considerable quantity of copper wire.

18797. And you think, though they were more expensive, that the rates were not unfair?—No, I think they were not unfair, considering the cost of getting them out.

18798. You do not think the difference was more than about 5 per cent.?—I cannot say how much the War Office had to spend in the transport of stuff.

18799. That would only have diminished the difference. It would not be more than 5 per cent., you think?—Quite so; including the cost of transport out from England, I do not think it was more than 5 to 8 per cent. more expensive. The usual charge they calculate in the Transvaal for the importation of English goods is 33½ per cent. It sounds enormous. And in the Orange River Colony, up to Bloemfontein, I think it costs up to 25 per cent. So that if you add that on to the cost of the thing in England, it would be what the local prices would be, and I do not think we paid much more than that difference.

18800. Is there any other point that you would wish to speak to?—No. I wish to emphasise all that I said in Paragraph IX., as regards the proper division of the units to be divided into three Army Corps, and also

the appointment of a head; I think that is very necessary.

18801. But, taking it as a whole, you were satisfied with the work of the Department generally?—Yes, I think it worked very well.

18802. (*Sir Frederick Darley.*) I do not quite understand the figures on the first page. You say messages forwarded, messages received, and messages transmitted. What is the difference between a message forwarded and a message transmitted?—A forwarded message is a message handed in by the public to be sent; a received message is one that is received and sent out, and a transmitted message is one that changes lines half-way; that is to say, it goes along one line from A to B, and at B it is transmitted along another line.

18803. Then those, taken together, work up to 10,709,768. Those, you say, represent 13,000,000 transactions?—Yes, because you have to multiply the transmitted number by two to find the number of transactions. The man at the original station has to work his instrument, and the transmitter man has to receive it, and another man has to send it on, and a fourth man has to receive it, so that if you multiply 2,800,000 by two, and add it up, you find the total comes to 13,000,000.

18804. (*Chairman.*) Is there anything else you would like to say?—It is noticeable what an extensive use was made of field cable lines. I have put it down that there were 3,749 miles laid, which clearly establishes the value of cable lines. I think they had never been used in war before, except to a very small extent. They were actually used at Tel el Kebir, but never to anything like that extent; therefore, I should like to emphasise the importance of getting out an efficient organisation for running cables; it should not be skimmed at all.

18805. Were all the temporary field lines cable lines?—No, partly cable, partly aerial lines on very light poles—poles of about an inch and a half or an inch and three-quarters thick.

18806. What was the distinction between the two?—A cable goes along the ground.

18807. I understand that; but in the use of them, I mean?—They were used indiscriminately. The cables were used when the columns were moving quickly, and if they moved very slowly, and you had time, you would naturally replace them by an aerial line, because the cable line is much more liable to interruption; in many cases it was all one could do to run a cable along the ground.

18808. (*Sir George Taubman-Goldie.*) The cable is much more expensive, too, is it not?—Yes, very much more expensive. It is about £200 a mile, I think. I will not be quite certain about it.

18809. (*Chairman.*) I suppose, when it was practicable, you would take it up again?—Yes.

18810. Would it be worth while taking down the aerial line, too?—Yes, that was done, except in cases where it was impossible, on account of the country being occupied.

18811. (*Sir Frederick Darley.*) Of what substance were the poles?—About 1½ in. at the bottom, and 1½ in. at the top, and about 13 ft. long.

18812. Were they made of steel?—They were made of pine, Oregon pine.

18813. Would they stand the stress of the weight of the wire?—Yes, they stand it very well, unless they are actually run into by transport. They were blown down occasionally by the frightful storms we had; but the chief damage done to them was by the transport.

18814. What interval was there between the poles?—80 yards.

18815. Did they stand the weight of the wire?—Yes, the wire is very light; the wire is of three strand steel, each strand 18 gauge; it is very light and very strong.

18816. (*Sir George Taubman-Goldie.*) Have you served in Natal at all?—No, I never went to Natal.

18817. Have you studied the ground of Spion Kop on the maps?—No.

18818. Could you say whether a cable might have been advantageously run up if a column went up there?—I could not say. I was never there, and I have not the faintest idea what it was like.

18819. (*Chairman.*) It could be used, I suppose, for positions?—Yes, it was used constantly for that very thing.

Brevet-
Colonel R. L.
Hippisley,
C. B., R. E.

13 Mar. 1903.

Brevet-Colonel R. J. Hippisley, C.B., R.E.
 18820. (Sir George Taubman-Goldie.) It can be laid quite rapidly?—Yes, you can lay it as fast as a horse can trot if you have fair going.
 18821. You see my point—if we could have had telegraphic communication at Spion Kop?—I doubt, even if it were possible, whether they had the stuff.

18822. That I rather wanted to ask you. Had they sufficient material?—I should think not.

18823. You think it would be advisable that a field army should be accompanied, as far as possible, with cable material?—Yes, certainly.

18824. That was very likely the reason why it was not laid at Spion Kop?—I think it is very probable that they had neither the stuff nor the men to do it.

18825. (Chairman.) Did the cable lines come out later in the war?—They came out continuously during the war.

18826. How was it it was not in Natal?—The reserves were so very small; the original reserves sent out did not admit of running many lines. We kept asking for more and more, and eventually it came rolling out.

18827. You draw attention to 3,749 miles being run. That is a large quantity?—Yes; but that does not mean that there were 3,749 miles used. It might have been the same cable over again.

Colonel W. H. MORTIMER, C.B., called and examined.

Colonel W. H. Mortimer, C.B.

18834. (Chairman.) When did you go out to South Africa?—I went out in September, 1899.

18835. And in what capacity?—I went out as Chief Paymaster to the forces under General Buller in Natal; at least, he was not commander then; he was Commander-in-Chief practically, but I went out to be Chief Paymaster to the forces in Natal, and, later on, when Colonel Wade, the Chief Paymaster in Cape Town, was invalided (that was from the 1st April, 1901), I became Chief Paymaster for the whole of South Africa.

18836. You have been good enough to prepare a few statements, I think, with regard to these matters?—Yes; I was asked to prepare a précis, and so I wrote out a statement which I thought, perhaps, it would be best to read to you.

18837. If you please?—And then you can ask me any questions in regard to it or any further matter you might wish. Prior to the late war in South Africa, the Army Pay Department had not been organised on a system which afforded sufficient elasticity for it to cope with a task of such magnitude as the campaign in South Africa threw on it, both in that country and in England. When the war commenced, the Establishment allowed for the Army Pay Department was 209 officers, namely, Chief Paymasters, 16; Staff Paymasters, 68; Paymasters, 125; making a total of 209, and actually serving at the time were 207 officers, the deficiency being in the junior ranks. By obtaining the services of some retired officers from this Department, the numbers were increased from time to time by 30. The elasticity the Department received was obtained, therefore, by voluntary service on the part of retired officers, and was not service which they could have been called on to render, so that the Department was really increased through voluntary service. The total number of paymasters who served in South Africa during the campaign was 78 and four re-employed officers, who only served out there for the early part of the campaign; the number invalided was 16, and one died. The largest number employed during a period never exceeded 65. The War Establishments (I had, perhaps, better explain that the War Establishments is the book in which all establishments for the various units and equipment required by them on service is laid down) for 1898 allow 20 paymasters for an Army Corps 36,259 strong. In South Africa there were about six or seven Army Corps of this strength, or the equivalent thereto; hence, according to the allowance in the War Establishment in 1898, about 130 paymasters should have been sent out—double the number of those working out there at any one period. Then, in regard to the Army Pay Corps in 1899, the establishment of Army Pay Corps clerks totalled 615. The reserve consisted of 23 clerks, of whom 19 were mobilised. There were also employed 62 permanent civilian and pensioner clerks, making a total of 696. In 1900 the establishment was increased to 620; in 1901-2 (750, and War Establishment 50) it was increased to 800; in 1902-3 (750,

18828. (Sir George Taubman-Goldie.) When you say eventually came out, do you mean after a year of war?—No, we kept on receiving consignments from time to time.

18829. Spion Kop was on the 24th of January, 1900?—Yes.

18830. Was there any large amount out at that time?—No.

18831. (Sir John Hopkins.) What is your allowance of field cable for an Army Corps? Is it a certain number of miles?—I think, at the present moment, under the present organisation, it is 32 miles per Army Corps. But that, I may say, is undergoing change at present; they are going to give us more. There are four sections to each Army Corps, and each section has eight miles of cable; that makes 32 miles per Army Corps. And then there is a certain amount held in reserve to be drawn by the sections as they want it. The actual figures of that I am afraid I cannot give you without reference to the tables. I should think it is about 150 miles in reserve, something like that.

18832. It is pretty heavy stuff to cart about, I suppose?—Two miles of it, including the drum, weighs about 200lbs., I think.

18833. (Chairman.) Is there anything else you would like to add?—No, I think not.

and War Establishment 150) it was increased to 900. The total number of Army Pay Corps clerks sent to South Africa during the campaign was 327; the number invalided was 82, and the number of deaths, 5. The most ever employed at one period would be about 268. The War Establishment of 1898 allowed 65 clerks for an Army Corps 36,259 strong, and, as the force in South Africa was six or seven times this number, about 440 would have been the proportion to have had out there, i.e., 172 short of the number allowed. There being practically no reserve, civilians had to be engaged, namely, in England up to 317 and in South Africa up to 194. In addition to these, 30 clerks were specially enlisted for the Imperial Yeomanry Pay Office. As troops were sent to South Africa, so also were officers of the Army Pay Department and clerks of the Army Pay Corps, but the proportion that could be, and was, sent was inadequate for the magnitude of the work they had to undertake, and, therefore, from the very outset of the campaign, nearly everyone had a share of work allotted to him which was too much for one person to perform satisfactorily, and in some instances was, no doubt, the indirect cause of individuals having to be invalided home. During a campaign of any magnitude, the duties and work which fall to the Army Pay Department and Army Pay Corps at home, and at the scene of operations, are heavier than in peace time; at home, by reason of payment of separation allowances, allotments from men's pay, half wages, all of which are paid monthly by station and other Paymasters, and the large amount of correspondence in connection therewith. Then, as the Militia is called out, so does the payment of the separation allowances and allotments increase. The correspondence, too, with charitable agencies is considerable. All this is in addition to the ordinary work of the Paymaster, which goes on as usual. At the scene of operations their duties are greatly increased in consequence of the constant changing conditions which cannot be foreseen, but which, irrespective of the treasury duties and duties connected with the payment of troops, and bills on account of contracts and otherwise, bring with them accounts, audits, correspondence, responsibilities, framing of regulations, and work which was hardly contemplated. For example, in South Africa irregular corps were raised, and various Colonies sent corps to take part in the campaign. The accounts of those units had to be provided for, and in some cases they were the cause of much trouble, particularly so in some of the South African irregular corps, owing to the acting Paymasters of them not understanding military accounts, not taking the trouble they ought to have taken in preparing and keeping them, lacking firmness, with both officers and men, and allowing their accounts to become involved. These were novices taken on as Paymasters at a minute's notice. The Imperial Yeomanry which was raised and sent out to South Africa became a source of trouble also, owing to the officers generally being inexperienced in accounts and not giving

sufficient care to the payment of their men and the preparation of their company accounts. Then there are exceptional accounts which we never see in peace time, such as railway, postal, Colonial Government, telegraph and cable, secret service, miscellaneous, provision of specie in the field, and numerous others which I could not quite call to memory, as I have written all this more or less from memory, and I have no records to refer to. These will give some idea of the additional work of an extraordinary nature which falls to the Army Pay Department in war time, and shows the necessity of having ample trained officers and clerks to fall back on. In further support of this I may mention that from the 1st October, 1900, to 31st July, 1902, during the period of Lord Kitchener's command, accounts were rendered to the War Office which showed receipts amounting to £10,015,201 9s. 9d., and expenditure amounting to £63,989,843 2s. 8d. I have no record of receipts and expenditure during Lord Roberts' command or subsequent to 31st July, 1902, but they will be proportionately large till the end of November, 1902, that is, proportionately large to the figures I have mentioned. The Army Pay Department, in spite of the scarcity of officers and trained clerks, and a peace training which is not calculated to encourage officers to take individual responsibility, managed to give general satisfaction not only to the authorities, but to all who had dealings with them. The fact, however, remains that their numbers were insufficient to enable them to have given the attention they ought to have given to many questions of detail: neither was it possible to send field paymasters to the front with large bodies of troops, as, for example, a division, or to post one at every point it would have been desirable to have had one; and it was due to banks opening at towns and stations that the scarcity in this respect was not felt to the extent it would otherwise have been. The deficiency in clerks was met, though not in the manner it would have been with trained clerks, by the employment of refugees from the Transvaal and Orange River Colony, many of whom had had clerical experience. The chance of obtaining the services of about 194 clerks from any other country we may go to war with is highly improbable. At home the want of trained officers and clerks was also very much felt, but the re-employment of 30 retired officers who volunteered for service, and the employment of 317 civilian clerks, carried the financial duties through. A knowledge of accounts and of the numerous regulations connected with the finance of the Army is necessary before any officer or clerk can be regarded as being of use, and this cannot be obtained without experience in a pay office for some months. The paucity of trained officers and clerks, then, is what was felt from the very outset of the campaign, and to obviate similar occurrences in future wars, the introduction of some system which provides a useful reserve of officers and clerks appears necessary.

18838. Have you any suggestions to make for remedying that state of things?—The suggestions I would submit are as follow:—A serviceable set of officers might be obtained from the Militia. Each territorial regiment might have one officer who had not done less than five trainings, or, if he had been in the Regular Army, had not less than five years' service altogether, and was going to remain in the Service, appointed Militia Reserve Paymaster. It would be advantageous if the officers had had a business training. These officers should come up some days previously to the training of any of the battalions belonging to the territorial regiment, and go down one month thereafter. It should be their duty to prepare the accounts of the battalions, or to do any other work the district or station Paymaster under whom they will be serving puts them to, so that they may learn the work in a pay office, and gain experience. It would be advisable that they be in addition to the present strength of the regiment. This yearly practice will produce about 68 useful Paymasters, who could be called on at any time. The following appointment appears necessary on active service, and the most suitable officers for it would be officers of the Army Pay Department, namely (if possible), a Chief Paymaster, to whom, if necessary, additional local rank might be given. His duties would be distinct from those of the Chief Paymaster in command of the Army Pay Department and Army Pay Corps. The appointment is that of financial adviser. It should be the duty of this officer to watch all contracts, financial arrangements and transactions, banking arrangements, expenditure and receipts for the General commanding, and to advise

and inform him on them; also to carry out any financial business which does not fall to a department, and, I ought to add, to communicate direct with the Accountant-General for the General commanding. Lord Kitchener found the want of such an appointment to assist him in controlling expenditure, and it was felt that the appointment was one which would have had beneficial effect had it been made from the commencement of the campaign. The advantage of having a Paymaster of experience to fill such an appointment is obvious, for he is conversant with regulations connected with finance and with accounts; he has been in touch with the finance branch of the War Office, and has had the advantage of benefiting by their observations on accounts to an extent no other officer could have. He would be able to enter a pay office and inspect vouchers, books, or records, without troubling anybody, and would be likely to treat in a more efficient manner financial questions and transactions than any other kind of officer. He would also be the best person to advise the General Officer as to writing off sums as losses, or how to treat such questions. To aid in qualifying Chief Paymasters for such duties, General Officers commanding Army Corps and districts should make their Chief Paymasters their financial staff officers, and make them deal with all financial questions which do not belong to a department or appertain to appointments. It is difficult to specify such questions, though on active service they are constantly arising, and in peace time are not infrequent. As regards clerks, the question of obtaining them from the Volunteer forces was recently considered by a committee at the War Office. It recommended the formation of a Pay Corps section in each Army Service Corps company, which, on mobilisation, would join the station pay office to which it was allotted.

18839. (Sir George Taubman-Goldie.) When you say recently, about what date was that?—I think within four months. I could not tell you the date exactly, but it is quite recently. I think I am quite right in saying about four months ago. It was shortly before I came to the War Office, and I joined on the 1st of January. It recommended also that this section should be allowed to enlist in the Reserve, and that the Volunteers should be required to go through a course of three weeks' training in a pay office before they passed to the Reserve, and should subsequently give six clear consecutive days each year in a pay office, which should count in lieu of 20 attendances for grant as for camp. This proposition, though it does not promise to give efficient clerks, might be given a fair trial, and, if the reserve of clerks could be utilised in connection with Militia accounts, the reserve officers and clerks could be trained together. Then we are not getting the very best of clerks for the simple reason that we have not the same opening in the Army Pay Corps as is offered in other departments and corps. In other departments and corps a good clerk may rise to the position of a Quartermaster. It is said that in the Army Pay Department there is no necessity to have Quartermasters, and that we have no appointments suitable to them; but to induce good clerks to come in, and to reward good superintending clerks, I have made the following suggestion: To induce the best class of clerk to come to the Army Pay Corps, and to remove a hardship from the warrant officers of the corps, prospects somewhat similar to those offered by the Army Service Corps, Army Ordnance Corps, and Army Medical Corps might be extended to them. Under present conditions, however good their services might be—active service or otherwise—there is practically no advance beyond first class Staff-Sergeant-Major for them, and therefore they are at a disadvantage as compared with warrant officers in other corps. Some years ago they were granted a higher rate of pay, namely, 6s. 6d. per diem, to compensate for this, but this is poor consolation to a deserving and able man, who finds his juniors promoted over him, and it is no inducement to able and ambitious clerks to join the corps. It is stated that there are no positions for the Quartermaster in the Army Pay Corps. Be that so. Then I would suggest that they be treated similarly to bandmasters, and for special meritorious service be granted commissions in the Army Pay Corps as lieutenants with corps pay, at 2s. 6d. a day. I have made a comparison here. The pay of a warrant officer is 6s. 6d., and he gets a ration allowance of 6d., and messing and kit 5d. a day, Service pay 6d. (that commences in 1904) a day, lodging 1s. 6d., and fuel and light about 8d., practically 10s. 1d. As a lieutenant he would get—pay 6s. 6d., corps pay 2s. 6d., lodging 3s., fuel and light about 4d. In the fuel and light I have to strike an average, and that gives him

a total of 12s. 4d. a day, practically 2s. 3d. increase of pay to a deserving man, as a special reward. That is small enough, but it is in the pension where these people feel it more than anything else, because a warrant officer with 30 years' service—15 years a warrant officer, five of which must be as a first-class warrant officer—can only get a pension of 5s. a day, whereas a lieutenant, on retiring, if he is retired for age, would get £200, or a minimum of £150; therefore, as a commissioned officer he would get the benefit which they all very much look forward to, and that really is what makes them so dissatisfied, to see other people benefiting so vastly as compared with themselves. That is all I have to say with regard to the organisation of the Army Pay Department and the Army Pay Corps.

18840. Then we pass on to the accounts?—As regards the accounts, officers commanding squadrons, batteries and companies found difficulty in preparing and rendering their accounts in the field, owing to constant trekking, field duties, casualties, and other causes which are common to active service, and a general opinion has been formed that on active service they should be relieved from this duty. Owing to the difficulty experienced with the accounts of the Imperial Yeomanry a system was tried by which the paymaster at the base compiled the company accounts from statements sent him, showing advances made and the men's acknowledgment thereto. Each man was provided with a small pay-book, from which the state of his account could be ascertained. This system, though simple, was not a success, not from any fault in itself, but principally on the part of the men who used the leaves of the book, which represented requisitions and receipts for other than the purposes they were intended for, and hence it became impossible for the paymaster at the base to reconcile his accounts with the men's pay-books, which became valueless as a record. Two schemes have been drawn up, one by Lieutenant-General Sir William Butler and the other by a committee at the War Office which investigated the question. It would be well to await the result of the trial which each system is to have. Lieutenant-General Sir William Butler's propositions make the paymasters perform all duties in connection with the payment of troops and compilation of pay lists. The recommendation of the Committee is that the officers commanding companies, etc., should pay the men and account to the paymasters, who will compile the pay lists from information furnished them—in peace time on a pay and mess sheet, in war time on a simple acquittance roll, when each man will be in possession of a pay-book showing all advances made to him.

18841. (*Viscount Esher.*) Do I rightly understand from that that Sir William Butler proposes that the paymaster should pay in peace time as well as in war time?—Yes; in fact, Sir William Butler's scheme is that the paymaster is to prepare all the rolls on a system somewhat similar to what is done in a civil establishment, and should send them up with the money to the officer commanding, who would pay the men their money weekly. It is to be given a trial, but my own opinion is that it will not succeed, because in the field I do not see how that is to be done. The system of recovering allotments of pay of non-commissioned officers and men to families and relatives was not suitable to active service. It was cumbersome, and caused trouble, confusion, and loss, not to mention correspondence and clerical labour; in fact, the clerical labour it imposed was stupendous. Every pay office almost in the field had to have a special clerk to look after these allotments. It has been suggested that on active service, for men who allot part of their pay to their families or relatives, only the net rate of their pay should be entered in the pay list in which their pay is charged, and that the amount allotted should be charged by the paymaster paying the allotments. That is all I have to suggest.

18842. (*Chairman.*) In South Africa I do not quite understand what your duties as paymaster were?—Practically our duties were to pay all the troops and all the expenses in connection with them, that is to say, all expense connected with the Army. As the Army advanced so the duties increased. For instance, it entered the Orange River Colony and the Transvaal. Then civil expenditure for a certain period had to be met, and of that we were relieved on the 1st of April, 1901.

18843. Then, do I correctly understand that all the expenses of the Army passed through your department?—Just so.

18844. Then the paying of the men passed through your department?—Yes, all payment of the men.

18845. But still that was carried out in the regiment by the company officers?—Just so; we were practically auditors of the accounts. The company officers prepared a pay list and sent it into the paymaster, who audited it, and the paymaster then compiled his pay list, which was sent to the War Office.

18846. (*Viscount Esher.*) Is there a paymaster to every regiment?—No, there is not. The way it is done is, a station pay office or branch pay office is formed, to which we attach so many regiments—say about eight or 10 regiments—for payment, and the regiments render their accounts to this branch pay office.

18847. That is in South Africa?—Yes.

18848. In the Home District here, how is it?—At home it would be done very much the same.

18849. Is that the way it is done now?—Yes; units have a station paymaster, to whom they render their accounts. For instance, take the troops at Dover, or at Aldershot. At Aldershot they have three station pay offices to pay the first, second, and third brigade. Each brigade has its own pay office there, and the troops in those brigades would render their pay list for audit to the paymaster in charge of each brigade.

18850. But how does the officer commanding get money to pay the men?—From the Field Paymaster; the Field Paymaster should accompany the troops.

18851. That is in time of war. How is it done at Aldershot to-day?—He requisitions on the paymaster in whose financial charge his company is, and this paymaster would give him cash or a cheque on the bank. In the latter case he would go down to the bank, draw the money, and pay the men.

18852. He has an account at the bank in Aldershot?—Yes.

18853. Who actually draws the cash?—The officer commanding the company or another officer.

18854. Then he has to have another cheque?—Yes, the paymaster receives his advance from the Accountant-General.

18855. Then he hands the cheque to him?—Yes, or he puts it to his credit in the bank; the paymaster receives what he calls an imprest, and he has another account with the officer commanding the company.

18856. I know he pays, but I did not know he drew the money actually?—Yes, he draws the money, prepares the pay list at the end of the month, and accounts for the money he has received from the paymaster. He prepares his pay list and sends the account to the paymaster.

18857. (*Chairman.*) There is no collective account for the regiment?—No; that really forms the regimental account. Say there are eight companies in a regiment; the eight company officers would draw for their eight companies.

18858. But there is no collective account, is there?—No.

18859. (*Viscount Esher.*) Then who is the sub-accountant? Do you consider the captain of the company your sub-accountant?—Yes, he would be the sub-accountant.

18860. (*Sir Frederick Darley.*) But he is surcharged in case of over-payment?—Yes; if he made any payment which was not according to regulation he would be held responsible.

18861. (*Sir George Taubman-Goldie.*) That system has been in force since about 1888, I think?—Yes; we used to have regimental paymasters.

18862. Can you remember the previous system?—Yes, I was a regimental paymaster for some time.

18863. Would you agree with a previous witness here that the present system has broken down?—No, I do not think it is quite fair to say it has broken down, but it is not satisfactory. It wants improvement. It certainly did not work satisfactorily in South Africa, for the simple reason that officers on trek did not find the time really to prepare the accounts of their companies. Also casualties were constantly occurring with them—some were shot, others fell ill and were sent home; others were sent hurriedly to take up extra duties and appointments; and transfer of accounts under such circumstances became very difficult.

advantages in the old system of a regimental paymaster.
18864. But even in time of peace, were there not great

master?—Yes, there were, of course, because the regimental paymaster was always with the regiment. In the 1882 campaign in Egypt, I was with the Gordon Highlanders, and, when the officers commanding companies got ill, and casualties occurred, for two months, I think I prepared the pay lists myself for the whole regiment.

18865. (*Viscount Esher.*) But you did not pay then under the old system yourself?—No, we never paid; we always gave the money to the captains commanding companies, who paid.

18866. But is there any objection to the paymaster actually paying the men?—I do not think he could possibly do so—he might do it on a few occasions—there are so few paymasters in proportion to the number of units. If you had a regimental paymaster for each battalion, etc., it might be done, provided the regiment was always together, but it is not. Parts are on detachment away, or it is split up for other reasons.

18867. But that only occasionally happens, and then you meet it by a temporary expedient; but do you see any objection to having a paymaster attached to every regiment, except on the score of expense?—Well, of course, that is the objection.

18868. That is the only objection?—No, but it has answered very well before.

18869. But then, as I understand, under the previous system the paymaster was only an auditor, and did not actually pay?—Just so; auditor and accountant.

18870. That might appear rather an extravagant system; but if the paymaster's duties, in addition to those of auditor, also comprise the actual payment of the men, then it would cease to be so extravagant a system, as he would obviously have more to do?—Yes.

18871. (*Sir George Taubman-Goldie.*) If I remember right, under the old system the paymaster was something more than an auditor. He was responsible for the pay list?—He was responsible for the pay list, and rendered it every three months.

18872. So that the captain of the company was not then responsible for errors as he is now?—Excuse me; if he made a mistake, and paid away what he ought not, he was held just as responsible as he is to-day.

18873. But was it not the fact that he had a pay list prepared for him by an expert, by the paymaster?—We prepared our accounts as regimental paymasters for the War Office for a certain period, but he had to give us an account of his company as he stood in our books.

18874. But when you were there as regimental paymaster, did not the captains of companies come to you in any difficulty?—Certainly. I used to help them through often.

18875. You were there, practically, always to give them a helping hand, and prevent their making a hundred mistakes, which they would have made otherwise?—Certainly.

18876. (*Viscount Esher.*) Do you think it is a feasible scheme that every regiment should have a paymaster, who would prepare the pay sheets and pay the men, and subsequently forward the pay sheets to your Department?—Yes; provided the men are all together, it is feasible, of course, but I do not think it answers on active service very well. Perhaps I am prejudiced, but I think it is desirable that officers commanding should certainly pay their own men; whoever prepares their pay list for them, that might be another question, but I think the officers should see their own men paid, and carry out that duty.

18877. (*Sir Frederick Darley.*) Why is that not done in the Navy?—The gunners pay their own men, I believe.

(*Sir John Hopkins.*) They are paid by the paymaster in the presence of the officer.

18878. (*Viscount Esher.*) That is met, as the Admiral says, in the Navy by the officer being present when paymaster pays?—Yes; but then in the Navy you are in a confined space; you have everybody there at your beck and call.

18879. Practically, so you are also here in time of peace?—Yes; but then you really want a scheme to suit both peace and war.

18880. But no scheme that you can make will be perfect; no scheme that has ever been devised yet will do that; your present scheme does not meet both, does it?—The present scheme, of course, is not satisfactory.

18881. Exactly; it broke down in South Africa?—Well, it did not actually break down, but it was not satisfactory. It gave a lot of trouble, and it was the cause of a good deal of loss.

18882. That is breaking down?—But we were able to obtain and render accounts. It was defective because it threw a duty on officers in the field which they could not readily carry through; in fact, they had to neglect some of their field duties to carry out their financial duties.

18883. (*Sir Frederick Darley.*) Have they not now to neglect a great deal of their military duty in time of peace?—Yes, there is no doubt about that; it would be better if the pay list could be compiled without them.

18884. (*Viscount Esher.*) Then, of course, the paymaster, in time of war, does not come into the combatant rank, and then the remark you made just now does not arise; he does not run so great a risk of being shot?—No; but the scheme that is being prepared by the War Office now is that the captains commanding companies should draw the money from the field paymaster who is at the front with the specie, and should get the men to sign a mere acquittance roll. During active service many items, such as hospital stoppages, ration allowance, minor stoppages, and entries of that kind cease. A man merely comes on pay, good conduct pay and corps pay. The idea is that he should draw whatever money he wants, and sign this acquittance roll. The acquittance roll is taken to the field paymaster, who gives the money for it, and the men are paid.

18885. But when you were paymaster of the Gordon Highlanders, you must have had considerable experience there. How many captains of companies actually drew the money themselves that you ever knew of?—The regulations were very strict then; always some officer used to come and draw the money for the men.

18886. He did not send his pay-sergeant?—No.

18887. The officer drew it himself?—The officer, or his subaltern, always came to draw the money.

18888. Who practically keeps the pay sheet, the sergeant or the officer?—They used to have, in those days, small books and pay sheets, and the colour-sergeant, who was the clerk of the Commanding Officer, prepared all company accounts for the officer commanding the company.

18889. (*Sir Frederick Darley.*) So that it took two men from their military duty. First of all, the captain or squadron leader, and also the colour-sergeant, in order to pay the men?—Yes, it interfered with their military duties, of course.

18890. (*Viscount Esher.*) Is it not the fact that the principal part of a colour-sergeant's work nowadays is to look after these pay sheets?—No, but it causes him a great deal of worry and anxiety.

18891. He is not a trained accountant?—No.

18892. (*Sir Frederick Darley.*) You spoke just now of district pay offices, I think, for the Army Corps?—Yes, there is a district pay office; that is where all bills for contracts for supply, Engineer, ordnance, and other services are paid from, also payment of staff and subordinates, etc.

18893. But it is from that district pay office, is it not, that the regiments are ultimately paid; that is to say, it is from that office that the pay comes for the regiments?—No; that would come from the station pay office or the branch pay office.

18894. Well, say the branch pay office. How many regiments are there attached to the branch office—how many battalions?—That depends upon circumstances.

18895. How many would you say, as a rule?—On active service, do you mean?

18896. No, in peace time?—It would vary according to the number of troops quartered in the command. For instance, there is a station pay office at Dover.

18897. How many battalions are there there now?—I think there are about five; but I am speaking from memory. It must not be taken as accurate.

18898. We will take it at five. How many clerks are there employed at that station pay office?—I could not say from memory.

18899. About how many do you think?—If I am to make a guess, I should think about from ten to twelve.

18900. Could you not get rid of a certain number of

Colonel
W. H.
Mortimer,
C.B.

Colonel
W. H.
Mortimer,
C.B.

those clerks if there was a paymaster to each regiment?—I think you would have to give the paymaster a clerk or two.

18901. Why need you do that?—Because one paymaster could not prepare all the accounts himself and pay the men; that would be more than one man could do. You would have to give him a clerk to help him.

18902. (*Viscount Esher.*) That would be two men to each battalion?—Yes; if you had a battalion of 1,000 strong you would want two clerks.

18903. It would be a very good battalion if it were 1,000 strong?—Yes; but out in South Africa that is what we had.

18904. (*Sir Frederick Darley.*) But I am speaking of peace time?—We should not have anything like that in peace time.

18905. Do you not think that one efficient paymaster would be sufficient?—No, I think you would require to give him clerks according to the magnitude of his charge.

18906. (*Viscount Esher.*) I suppose the pay-sergeant gets extra pay now?—Yes.

18907. Then, at any rate, you would save that; that would go towards the paying of the clerk?—Yes.

18908. (*Sir George Taubman-Goldie.*) Speaking of this War Office Committee on this subject, were you sitting on it, or did you give evidence before it?—No; I do not remember giving evidence; I do not think I was in the country during the time.

18909. I mean the Committee that you were speaking of as sitting during the last four months?—No; my information is only from what I have read.

18910. You did not give evidence before it?—No.

18911. We have had a very high opinion on this subject, and the witness, while saying, as you say, that it is a good matter of discipline that the captain should pay the men, went on to say: "But as regards the accounting, the keeping of the accounts of the men, I think we shall be able to take that away from the Captain of the company and put it upon the Paymaster, making the Paymaster the Accounting Officer and the Captain simply the Cashier, with the simplest possible account of cash receipts and cash expenditure." Do you approve of that?—I think that is very good.

18912. In peace, as well as in war?—Yes.

18913. (*Sir Frederick Darley.*) But if there were a paymaster to each regiment, do you not think you might go a little further, and make him the cashier, so as to take away from the combatant officers all the responsibilities of pay. If you were to make him cashier, then you would make him the accounting officer?—That is very true; but, still, I cannot help thinking it would be a mistake to relieve the officer entirely from paying his men.

18914. (*Viscount Esher.*) But why?—I was 14 years a regimental officer myself, and, somehow, the system has grown up with me. Perhaps I could not give you any particular reason, but I am certainly of opinion that it would be a mistake.

(*Sir Frederick Darley.*) You say it keeps the captain in touch with his men, but I cannot help thinking that an officer, if he is training his men, is much more in touch with them while he is training them than he is by simply paying them their wage weekly, fortnightly, or monthly, as the case might be.

18915. (*Viscount Esher.*) And, you see, you have got this, that that is the plan which is pursued in the Navy, where the officer is present while the men are paid?—Yes, I admit that; but I think you would find, when the regiments were distributed all over the country in detachments there would be great difficulties in it.

18916. But regiments very rarely are distributed all over the place, and when they are you make a special arrangement. Could you not make a special arrangement to meet the special circumstances?—Of course, it could be done, but I cannot help thinking that you would find it would be a far better system to let the paymaster keep the pay lists and prepare them, and make the company officer the cashier.

18917. (*Sir Frederick Darley.*) We have had evidence here from the colonel commanding one of the irregular forces raised in South Africa that they had a paymaster, but that that paymaster was itinerant; that is to say, he went about—wherever the men were, he went to pay them?—That was in South Africa.

18918. Yes?—I know that was done, but each of those paymasters had two clerks to help them in preparing their accounts, and that enabled them to go about as they did. And then they did not pay with the regularity with which a regular officer would pay; and there were a great many complaints by the men, who said that they could not get their pay, and made statements of that nature.

18919. This officer did not seem to think that there were complaints in his command?—Would you mind telling me the officer's name?

18920. It was Colonel Thorneycroft?—Oh, yes. Captain Chipman was the paymaster; he was a man whom I selected myself and recommended Colonel Thorneycroft to take for his regiment. He was a manager of the Lingham Timber Company, and he did remarkably well; but all regiments were not so fortunate as that. He was a very experienced accountant; and not only that, but he was a soldier at heart, too; he wanted to be in the front line and see a little bit of the fighting as well; so that took him up there. But all the paymasters were not like him.

18921. (*Sir George Taubman-Goldie.*) We have had evidence that during the war in South Africa if the bills and vouchers were presented to the Army Pay Department men it was their duty simply to pay, as bankers, without examining in any way whether the prices were fair or not?—Payments are made according to contracts, with which all bills are compared; but on active service in South Africa, where contracts could not be made, Army Book 67, the leaves of which represent an advice, draft, and receipt, was brought into use. Certain officers were given that book, and they used to pay at the time they made purchases. In the field it was General Buller's wish that expenses should be paid as they were incurred, and therefore this arrangement was come to. It was inadvisable to carry large sums of money into the field, and hence certain officers were entrusted with this book, and they paid for all the purchases made. Then these drafts came down to the paymaster, who audited them. The officer was directed to give the full details in the advice portion of the leaf or on back thereof, and the paymaster audited it and saw that it was correct, and if it was so he embodied it in his accounts.

18922. But the only audit that he would perform was an arithmetical audit; it was not his duty to see whether the prices were fair?—There was the agreement, and he had to accept it.

18923. That is just the point that I want to make. We have had full evidence on the point both from the Accountant-General and Sir Fleetwood Mason, and others; and at present the Army Pay Department has no authority apparently to control expenditure on behalf of the General?—None whatever. That is just the point, and that is why I recommend that there should be a financial adviser, who should watch all contracts on behalf of the General, who is really too busy in the field to give his attention to these matters. If the General had a trained officer who would watch these things for him, the paymaster would get acquainted with everything financial. I may illustrate that by telling you that when I went round to Natal, General Wolfe Murray, before he engaged nurses, doctors, clergymen, or any other person, would say to me: "What are we to pay?" I would find out what the market value was, and according to the market value so did we engage these people. Later on, when it was found that the rates we were paying were very much less than those paid at the Cape side, of course, they said: "We are all serving in the same Army; it is unfair that the Natal people should be paid a lower rate than the Cape people." And eventually when the two armies joined rates were levelled up and all paid alike.

18924. Then my point is this: Is it not necessary, not only to have a Financial Adviser to the General of the Army Corps—or, I will say, of the Army in the field—but also that comparatively junior officers of the Army Pay Department should be there to advise Generals, Division Generals, Brigadier Commanders, Captains, and so on?—Yes, I think it would be a very good thing if they always had somebody to watch that sort of duty for them and to advise them on it. For instance, Lord Kitchener wanted me, before any of the civilians were invited to come out, to accept this office, but I told him at the time I had not been trained, I did not think I could possibly do it, and that I did not quite understand what was required. He asked me to suggest some

See
Q. 7919.

names, and I really could not suggest anybody who I thought was fully trained to offer to him.

18925. But you understand, do you not, that I am not so much pressing the point of a Financial Adviser, such as yourself, to the General in Command. I am looking more to the details of troops in the field constantly making local contracts, and I am asking you whether you do not think it is necessary, both to strengthen the numbers of the Army Pay Department and to specially train them to meet those emergencies in time of war?—I think it is very necessary that they should have training to meet those emergencies. They do, of course, see all contracts that are made in peace time. In the district offices every officer sees the contracts that are made.

18926. Even junior officers?—Yes. When I was a district officer I made it a point that all these officers should see the contracts that were made, and I also set them to work to check the bills with the contracts, so that they should not be ignorant of the manner in which that is done.

18927. Do you think that is general with district officers?—I could not say whether they do it in every office, but I believe that in every office where the paymaster takes an interest in his officers you will find it is done.

18928. At any rate, you would recommend that it should always be done?—Yes, I would.

18929. So as to give the junior officers a knowledge of prices and of the system of making contracts?—Just so. For instance, at one time in South Africa, when I first went up to Pretoria, Lord Kitchener said to me, "I want you to look at the bills, and tell me whether you think the prices are fair for the purchases made, and I want you to instruct your paymasters to do the same, and I want you to let me know what you find," which was a very good thing. We promptly turned up the Ordnance vouchers, which showed that the expenditure on account of Ordnance was abnormally high.

18930. Did you happen to notice the price paid for bandoliers out there?—I forget now what it was, but I know that the price for leather leggings and one or two other things struck me as very funny at the time. One thing particularly was the price of breeches; ready-made breeches you could get for about 5s. 6d. or 7s. 6d., but if they were cut to order they charged £2 or £3 for them, and so on. Of course, if you put the paymaster in authority, as he runs through these things, he will draw attention to an expense of that kind at once.

18931. But in South Africa he had no authority to do that?—None whatever. A bill is sent in, it is allowed by the head of the Department, and we have to pay it; we have merely to run up the total, extend the figures, and see that it is right.

18932. And those accounts are kept and audited in London?—I do not know about that; but in that sort of way, if we were given authority, we might do a good deal. Lord Kitchener desired, of course, that we should do so.

18933. But you had no staff—your men were overworked?—I may mention now that, in order to do that, I took on some of those bills myself, and sat up to about midnight doing it, and I put in slips to show wherever I thought a thing was not right and proper.

18934. That would only cover, of course, a small proportion of the enormous expenditure in South Africa?—That was only for one month. Then, of course, inquiry was set to work; civilians were sent out from the War Office, and the matter was gone into.

18935. (*Viscount Esher.*) But had any of those points been considered before the war actually broke out?—No, I do not think any of them had been. You see every Department has a head, and that head is the actual responsible staff officer to the General Commanding for his Department and the expenditure connected therewith, and the General, naturally, would call on that officer to answer for any expenditure in connection with his Department.

18936. But what I mean is this: It had never occurred to the Accountant-General before the war that these difficulties might arise?—I do not think I am in a position to answer that.

18937. (*Sir George Taubman-Goldie.*) At any rate, you never heard of any organisation being established before the war at any period to meet the requirements in the field?—We had no organisation to meet the require-

ments in the field; but they were very good; they sent one out with a free hand, and I am not certain that I would not prefer to go out with a free hand and organise as I thought best.

18938. If you had sufficient men?—Yes.

18939. But you commenced your evidence by saying that you were very short of men?—Yes.

18940. And that your men were worked to death?—Yes.

18941. Without any control—merely in paying?—Yes, in pay duties. I ought to say that Lord Kitchener, when he came, wanted to exercise control, and did not quite know how to get it. He had had control in his own office in Egypt, he controlled the whole expenditure there, and he wanted to do the same with the large force in South Africa; but it was very difficult; and he used to make me bring him a statement every month, showing what the expenditure was for that month, and inform him of items where there was an increase, and, if possible, explain the reason of such increase. That, practically, was outside my duties. It was the officer in charge of the Department whose duty it was to explain that increase—or it might be a decrease; and so as I gave him the figures he used to call on the officers of the Departments to explain them.

18942. Would that be one of the Army Pay Department?—No.

18943. Of what Department?—For instance, the Ordnance Department, Supplies, Railways, Transport, Remounts, and so on. I kept rough copies of the figures that I gave him, and that is the reason why I was able to give accurately the expenditure and receipts for the time I was his Chief Paymaster.

18944. Have you served in India at all?—Yes, but not as paymaster; I was there from 1865 to 1875.

18945. Have you studied the Indian system? I have here a document showing that the system of control in India is very superior to ours?—Yes, I think it is. I saw that system, too, in South Africa. They had a control officer there, who absolutely controlled the whole expenditure. Of course, he is under the orders of the General Officer Commanding, but he absolutely controls, and he audits his own accounts, and they are accepted by the War Office. He had an ample staff, and was really a powerful and useful man.

18946. Do you see any reason why that should not be introduced *en bloc* into our system?—No, I think it would be a very good thing.

18947. (*Sir Frederick Darley.*) If each regiment had its own paymaster, would not that give you the increase of men that you require in the field? These paymasters could be trained to the work, could they not?—Yes, it would certainly, but if you had a paymaster to each regiment, and you gave him two clerks, and he paid all the men, I presume you would propose to bring the paymaster and his clerks to the base.

18948. I mean that you could then work them, and, if they were trained under you, they would be responsible to you, in fact, as the Chief Paymaster?—Yes; but then there are the district works and other works. I have read you some of the extra duties that are thrown on to the paymaster on active service; you would want special officers and clerks to carry those out, too.

18949. But could not they take some of that extra duty off the hands of the Chief Paymaster?—I do not think so—that is, to any extent.

18950. This was the evidence which was given with respect to the paymasters who paid the detached units. The question is put: "The second point is the necessity of a regimental paymaster; that you have spoken to?" And the answer is: "Yes. It is impossible that a company commander or a squadron commander (whichever you like to call him) in the field, who is constantly out reconnoitring or on outpost duty or fighting, can have the responsibility of the cash and accounts passing through his hands; and I had advocated this for so many years in the Regular Army, as well as in any other corps, that I determined I would do it when I had the opportunity. The paymaster, when money was wanted, got it from the nearest point, either from the nearest bank, or he went down and got it from the district Chief Paymaster; he brought the money up to my camp, and he paid the men, marking on a simple pay sheet. Thus there was no checking of accounts again; he had not to check the accounts of the company officers; there were his own accounts kept in a business-

like manner by the Paymaster himself, who was paid to do that job, of what he had paid to the men. The only necessity was that there should be some man, some officer or sergeant, present at the payment to say, 'This is John Smith or William Jones,' and to identify him to see that the right man got that pay. That relieved all the fighting officers of the responsibility of money affairs, which I consider a very great point in the efficiency of a corps." Then the question is put: "It is said that when a regiment is split up (which was constantly the case in South Africa), there might be a difficulty in getting the paymaster to pay them all?" And the answer is: "I found no such difficulty. The paymaster or the paymaster-sergeant took the money down. I had constant detachments, and I found no difficulty in getting the men paid in that way." That is the evidence that was given?—I presume that that is Colonel Thorneycroft?

18951. Yes?—As I say, he had an exceptionally good paymaster, but I do not think it was the same with all regiments. If we had trained paymasters, of course, it would come to practically the same.

18952. (*Viscount Esher.*) Does every non-commissioned officer and every man in the Army sign a pay sheet?—Yes.

18953. He actually signs it?—He signs the duplicate pay list.

18954. That is to say, when the money is handed to him he signs the pay sheet?—No, he signs at the end of the month. When his account is made up, he signs the duplicate pay list.

18955. (*Chairman.*) Is there anything else you wish to add?—I have nothing further to add.

FORTY-SEVENTH DAY.

Tuesday, 17th March 1903.

PRESENT:

The Right Hon. the Earl of ELGIN and KINCARDINE, K.G., G.C.S.I., G.C.I.E. (*Chairman*).

The Right Hon. The Viscount ESHER, K.C.B., K.C.V.O.

The Right Hon. The Lord STRATHCONA and MOUNT-ROYAL, G.C.M.G.

The Right Hon. Sir GEORGE DASHWOOD TAUBMAN-GOLDIE, K.C.M.G.

The Hon. Sir FREDERICK MATTHEW DARLEY, G.C.M.G.

Admiral Sir JOHN OMMANNEY HOPKINS, G.C.B.

Sir JOHN EDGE.

Sir JOHN JACKSON.

BERNARD H. HOLLAND, Esq., *Secretary*.

Vice-Admiral Sir R. HARRIS, K.C.B., called and examined.

18956. (*Chairman.*) You were in command at the Cape in 1899?—Yes.

18957. And you remained in command throughout the war?—I remained in command till 1901; in May I left the station.

18958. In 1899 were any preparations made for the war on its outbreak?—From a naval point of view, yes.

18959. At what date were those preparations made?—About August I began to assemble the ships in my squadron and put them all through a thorough course of docking and repair in readiness for any emergency.

18960. Was that on instructions from home?—No, I did it on my own initiative, on what I imagined was coming. Of course, I was in consultation with Lord Milner as well—Sir Alfred Milner he was then.

18961. But there were no instructions from home?—There were no instructions from home until immediately before the outbreak of the war.

18962. What preliminary knowledge then had you of the matter?—It was a matter of very common conversation in Cape Town that the Boers were preparing for war. That was in June; and in July I was shooting near Port Elizabeth and met several English farmers of that district who told me that they were absolutely certain from what they knew of their Dutch colleagues that they were preparing for war. Following that up again I went up the River Maputa from Lourenço Marques on a shooting expedition nominally, but for another purpose really, and there I came across a Dutch farmer named Kotse, who travelled constantly in the Orange River State and the Transvaal, and he asked to speak to me privately. He said to me: "Well, Admiral, I may tell you this in confidence. The Boers are certain to make war directly the grass comes in October." I said: "What is your reason?" and he said, "I travel about from farmhouse to farmhouse, and they all tell me war is coming." I naturally made a note of that and telegraphed it to Lord Milner.

18963. They were waiting for the grass to come in October?—Yes.

18964. But they were making all their arrangements to move as soon as the grass came?—Yes, as soon as possible; and as a matter of fact, they did; directly the grass came in October they commenced.

18965. And you then communicated that to Lord Milner?—I let Lord Milner have a telegram at once. I went up the Maputa River, I may say, with the view, in case war broke out, to find a base to get up by sea through Portuguese territory if they would allow it, and up the Maputa River you can take boats up to within 40 miles of the Transvaal, with very easy country for going over.

18966. Was the result of your communications with Lord Milner that you began to make preparations?—In a great measure. Of course, I had a very small squadron, and it was very necessary that they should all be perfectly complete before war broke out, as the station is a very extended one. It reaches from north of the equator on the west side up to the equator very nearly on the east side. The ships are generally spread about a good deal, and it would take me some three months, in the event of war, to get them together. They then want docking and repairing, and, as a matter of fact, every one was docked and repaired before the war. They were absolutely ready when war was declared on October 11th.

18967. You made your preparations with the concurrence of Lord Milner?—Hardly with his concurrence; with his approval. He thought it was quite necessary to do so.

18968. I mean he recognised the situation?—I may say also that in consultation with Lord Milner I had arranged that each ship should have a separate station or port to go to on the outbreak of hostilities, so that they could take up the protection of those places.

18969. I was only anxious to get out that Lord Milner agreed with you that the information that you got was sufficient to justify your taking such steps?—Most completely.

18970. Will you tell us the preparations that were made?—The ships of both my East and West Coast squadrons were got down to Simon's Town Docks, and all their engine-room defects were put right, and they were made ready; and as a matter of fact they lasted for a year without requiring docking or repairs, which was very important, because we were rather short of ships.

18971. Your object being to get them all together?—

My object being to get them all together ready for this outbreak when it did take place.

18972. And you mention in your *précis* that, fortunately, both coasts were quiet?—Yes, they were both quiet. Fortunately for us, there was nothing on on the East Coast, and but a small prospect of disturbance on the West Coast, but it did not come off for two years later.

18973. But you had to keep a ship there?—Yes, I had to keep a ship there on account of that; the "Barracouta" was kept there.

18974. Then what was the actual strength of your force?—The actual strength at the time of the war was as follows: The actual ships that I had under my orders at the time of the outbreak were the "Doris," "Forte," "Magicienne," "Philomel," "Tartar," "Barrosa," "Barracouta," "Monarch," "Widgeon," "Partridge," "Thrush," and "Dwarf." I may add that the "Dwarf" was not brought down till later, because she was a very light draught vessel, and her services are nearly always required at Lagos, which is almost her permanent station, but later in the war it was necessary for me to bring her down on account of her light draught.

18975. What class of ships were they?—The "Doris" is a second-class cruiser; the "Forte" is a second-class cruiser, the "Magicienne" is a third-class cruiser, the "Philomel" is a third-class cruiser, the "Tartar" is a third-class cruiser, the "Barrosa" and "Barracouta" are very small third-class cruisers, the "Monarch" is an obsolete ironclad, the "Widgeon," "Partridge," "Thrush," and "Dwarf" are all gunboats.

18976. Afterwards had you reinforcements?—Very soon after war commenced I had the "Powerful," the "Terrible," and the "Niobe" sent to me, followed by the "Fearless," the "Pelorus," the "Raccoon," and the "Thetis."

18977. And some of those were large ships?—The "Powerful" and "Terrible" were very large, and had very large complements too.

18978. And what was the disposition of those ships at the outbreak of the war?—The actual disposition just before the ultimatum of nearly the whole of the first I mentioned, except the "Barracouta," the "Dwarf," and the "Widgeon," was at Simon's Town, and immediately the ultimatum was received they sailed for the ports for which they were detailed.

18979. Was there any arrangement made between you and the military as to what assistance you could give?—I made every offer of assistance to the military shortly before the ultimatum. The reply I got was: "Very many thanks, but no assistance is required."

18980. Was that from the General Officer Commanding at the Cape?—That was from the General Officer Commanding.

18981. At the Cape?—At Cape Town. Sir Forestier-Walker was in command then.

18982. That was before the outbreak?—I should not like to be particular to a day, but it was very close on the ultimatum, either a day or two before or a day or two after. I may add that I sent a complete list to him of all the stores and small guns I had in Simon's Town Yard, saying they were available and at his disposal if he liked to request them. Owing to the confusion, I suppose, that took place at the beginning of the war Sir Forestier-Walker does not own up to having received that. I asked him if he had some time afterwards, and he said, No, he had not—he had never seen it. As a matter of fact, it was sent by my secretary and acknowledged.

18983. (Sir John Jackson.) Who was it acknowledged by?—I think it was acknowledged by one of the people on his staff, and probably signed by Sir Forestier-Walker. I am almost certain about that.

18984. (Chairman.) And were those guns used?—Afterwards they were all used.

18985. But not at first?—Afterwards they were used, and a good many guns were taken out of the ships and used as well. My position was this: that unless I had a demand made upon me by the military for guns I had no power to expend the money in the dockyard in fitting them or lending them.

18986. When did you receive the request for assistance?—The first request that I had for assistance was about three or four days after the outbreak of war. Then I was asked to send a small naval brigade and two guns to Stormberg, to hold Stormberg against any

attack of the Boers, who were coming down through the Orange Free State then.

18987. Did that come from the military or from the High Commissioner?—That came from the military, from the General Officer Commanding at Cape Town.

18988. Did the High Commissioner also approach you on the subject?—Yes. I may say that two days in the week at least I used to go up from Simon's Town to Cape Town to see Sir Alfred Milner and tell him what I was doing and where our forces were, and asked him if he wanted anything more done with them; so that he and I were in complete touch the whole time.

18989. And this brigade was sent up?—This brigade then was sent up to Stormberg with two 12 pound 8 cwt. guns, the short 12-pounder guns.

18990. And how many gunners?—About 140 all told, chiefly marines. The marines went as escort for the guns, and the blue-jackets worked them.

18991. Did that brigade remain on shore after that?—They were sent up to Stormberg, and when they arrived at Stormberg, the marine officer, Major Plumber, in command of the marines, or Commander Ethelston, in command of the Brigade, wrote to me, and said that he considered the position such that Stormberg, held then by half a battalion of the Berkshire Regiment and the naval guns and marines, was quite indefensible. However, they remained on until the arrival of Sir Redvers Buller. Then the question was put to him, and he decided that the position was indefensible, and they were then ordered to fall back to Queenstown, which they did; that was about three weeks afterwards, or a fortnight.

18992. And they remained at Queenstown?—There they remained at Queenstown for a considerable period, and then they were withdrawn on the request of General Buller, and moved up with an augmented force and two 4.7 guns to join Lord Methuen.

18993. And they were part of the brigade that served with him?—They became the brigade that served with Lord Methuen which was so much cut up at Graspan; but the two 12-pound 8cwt. guns were, by the request of the military, allowed to remain at Queenstown, but taken over and worked by the army afterwards, when this brigade came back to Simons Town again they were given two fresh guns—and two 4.7 guns—to take up to Lord Methuen.

18994. Was the strength that went with Lord Methuen the same?—It was increased by a number of bluejackets to work the two 4.7 guns, and a Captain was put in command instead of a Commander.

18995. Then the next operation was at Durban?—After that the question became a very serious and grave one at Durban. But, if you will allow me, I will just state first of all what the situation was at Cape Town.

18996. If you please?—Lord Milner told me that he considered the situation in Cape Colony was very grave indeed, and as troops arrived they were always hurried off somewhere else, and he thought the actual defence of Cape Town itself was very important, and he begged me that I would always have a Naval Brigade of 500 men at least ready for immediate landing and ships to protect the approaches to Cape Town, as from the shore there is a flat approach from either side—from False Bay on one side to Table Bay on the other. I followed out that plan always. I had to keep the force of 500 men always ready for landing and the requisite guns and ships necessary to take up a position on either side; the ships placed in False Bay on one side and Table Bay on the other very nearly command the flats of Cape Town. That handicapped me, of course, in sending people elsewhere.

18997. That would very nearly secure the protection of Cape Town?—Yes. I think the Boers would have been very chary of approaching under ship fire from either side. Of course, it also helped to protect Simon's Town, because if Cape Town had gone and Simon's Town was cut off it would have been a very bad thing for the coal depôt, the ammunition, stores, and everything else, which were very valuable in Simon's Town. I may say that after the ultimatum the Admiralty telegraphed to me and said I was to consider it my principal duty to protect the seaports of the coast, but not, if possible, to land any men except in a case of great emergency.

18998. That was immediately after the ultimatum?—Yes.

Vice-
Admiral Sir
R. Harris,
K.C.B.
17 Mar. 1903.

Vice-Admiral Sir R. Harris, from home. 18999. (*Sir George Taubman-Goldie.*) That was an instruction from home?—Yes, that was an instruction from home.

K.C.B. 19000. (*Chairman.*) And were those instructions modified afterwards?—Yes. As the pressure became greater the Admiralty practically gave me a free hand as regards sending up people, on condition that the ships were kept fit for immediate service in case of contingencies occurring in Europe. But I was warned by the Admiralty that the "Terrible" was very much required in China, and that if possible I should avoid sending her men to the front, so that the men could be easily recalled and the ship sent off to China in case she was wanted out there.

19001. You are speaking now as to the position at Durban?—Yes; the position at Durban began to get critical. It was not so much at Durban at first; it was most critical at Pietermaritzburg. The Governor of Natal, Sir Walter Hely-Hutchinson, was very apprehensive that the Boers might leave Ladysmith and approach by the Greytown road, and come down and carry Pietermaritzburg very easily. It is a place I knew very well, and I thought it was quite indefensible, and so it was arranged in the event of any difficulties to retire on Durban, and put all the archives and things on board a man-of-war stationed there. Then Sir Hely-Hutchinson determined to try and make a stand at Pietermaritzburg until the Boers actually approached, and we lent him two long 12-pounders to mount on Signal Hill at Maritzburg by way of deterring the Boers from approaching. Then, as the Boers began to invest Ladysmith more closely, and we thought they might come down to Durban, the burden of protecting Durban was thrown upon my shoulders by the Admiralty by a telegram, which said I was to protect the towns, so I despatched the "Terrible" there, and asked that the Captain of the "Terrible" might assume the complete control of the place as Military Governor. Both the Governors concurred, and they appointed Captain Percy Scott as Military Commandant at Durban. He, about forty-eight hours after his arrival, telegraphed to me that Durban was in a state of complete defence, which relieved all our anxiety on that score.

19002. That was after the siege of Ladysmith had begun?—Yes, some time after; about a fortnight after.

19003. Then before the siege of Ladysmith, as we know, you sent up guns and men to Ladysmith?—Yes, the guns were sent up to Ladysmith first of all. They were sent up before we thought that Durban was in any danger. Sir George White telegraphed to me on October 25th for guns. I have got his message here. This is the way the message came to me:—"25th October, 1.30 p.m.—From his Excellency Governor Natal.—Following from Sir George White: '24th October.—In view of heavy guns being brought by General Joubert from the North, I would suggest that Navy be consulted with a view'—(then there comes in cipher a word or two that are missed out, and owing to Ladysmith being closed up rapidly they were never able to be put right)—'sending your detachment, consisting of blue-jackets, with guns firing heavy projectiles at long ranges' I have replied as follows: 'Sending undecipherable. Please repeat. I am communicating with Admiral. Do I understand you have determined to keep the troops at Ladysmith. If you have I ought to be informed at once. Seems no doubt now part of force of General Joubert will come in by Greytown. We are practically defenceless here and in Durban.' On that telegram I thought it was necessary to send guns to Ladysmith, and I determined that I would send a Naval Brigade from the "Powerful" with two 4.7 guns and four 12-pounders. Those left Simon's Town in the "Powerful" forty-eight hours afterwards. I telegraphed to have everything clear at Durban for sending them straight into Ladysmith, and they arrived forty-eight hours afterwards at Durban, and twelve hours after that they were in Ladysmith itself in time to help Sir George White. Then he telegraphed to me later on: "30th October, Ladysmith, from General Officer Commanding" (this was only five days after he asked for the guns)—"Your long 12-pounders

have been most useful to me to-day. Could you send as many more as possible with detachment to work them to Pietermaritzburg and Durban if railway remains open? I can get some more of them here. Natal Colony is in very urgent need of defence." I may say that I made preparations for sending more guns, but on November 1st, I think, Ladysmith was closed.

19004. So of course they could not be sent?—More ammunition did actually go as far as Maritzburg, but it could not get any further.

19005. Is that all you wish to say about the landing of the men in Natal?—Later on, of course, there were a great many more men sent to help General Buller on his advance, but I think, dealing with the actual period that we are talking of now, late in October and in the early part of November, I limited myself as much as possible to those men then, so as to keep the ships efficient. Sending a brigade to Ladysmith from the "Powerful" broke up the "Powerful." I had simply to tie her up during the rest of the war, and if I had had to deal with the men from the "Terrible" in the same way I should have had to tie her up too.

19006. What happened next?—After General Buller had got round to Natal he asked for assistance in guns and men. First of all he asked for a few, and then he asked for some more, and eventually they got up to a large number of guns. I think they had about twenty-two guns with them at one time.

19007. And how did you manage to provide those?—The Admiralty were very prompt in sending guns out from England. As fast as I sent a gun up another was despatched immediately, so that I was never more than three weeks short of a gun, and the ships themselves were never more than a week or ten days without a gun or the replacement of a gun from the arsenal at Simon's Town. I started with four 4.7 and, I think, eight spare 12-pounders, and they were very soon worked off.

19008. (*Sir John Edge.*) And the men?—I broke up the "Powerful" and the "Terrible," and the other ships had to go short-handed. When the "Terrible" men were landed for the defence of Durban she was simply tied up useless. The complement that remained on board were only enough to steam her. No fighting qualities remained at all.

19009. (*Chairman.*) You did not get any assistance from home in the shape of men?—Yes; men came out later, and came out fairly promptly, but not enough to fill up the "Terrible" and the "Powerful." I may say that the reason I utilised those two big ships for those purposes was because, in the first place, they had a large complement, and, in the second place, they burnt so much coal that they were absolutely beyond my power to keep them complete if I had used them as cruisers.

19010. (*Sir George Taubman-Goldie.*) Was there a large stock of coal at Simon's Town?—When the war commenced about 15,000 tons were in store, but we were always relying on supplies of Natal coal coming round from Durban, but the moment the Boers got to Dundee that was cut off, and we had to rely on England.

19011. Were you well supplied?—There was never any panic about it, but we ran rather close once or twice for transports. Sir Redvers Buller appealed to me once or twice for help for transports, and I said that I could do it, but that I should be very much put to it if I did. As a matter of fact, it was all got over in Cape Town, and there was no hitch.

19012. You could not have used the "Powerful" and the "Terrible"?—I think not. It would have put such a tremendous strain on the resources of coal. Every time they coaled they required 2,000 tons nearly, and sometimes more.

19013. (*Chairman.*) Do you know what the total number of men that you landed was?—The total number of men landed from the Navy at any one time, I think, a little over 1,400.

19014. And guns?—I have a list of the guns. This is a complete list of guns and ammunition supplied to the

Army during the whole of the war. (The list was handed in, and is as follows.)

GUNS and AMMUNITION supplied to Military Authorities and Naval Brigades, South Africa, to 10th April 1901.

Guns.						4.7" Ammunition.				12-pr. 12 cwt.			12-pr. 8 cwt.		6-pr. Rounds.	7-pr. Rounds.	Small-arm Ammunition.	6" Rounds.	3-pr. Rounds.
3-pr.	4.7".	12-pr. 12 cwt.	12-pr. 8 cwt.	6-pr. Q.F. Hotchkiss.	4.5" Maxim.	Lyddite.	Shrapnel.	Common.	Cartridges.	Shrapnel.	Common.	Cartridges.	Case Shot.	Cartridges.					
1	21	30	7	1	13	3,612	2,384	5,303	12,192	6,260	17,334	18,630	120	2,450	1,100	182	693,200	780	1,120
						11,299				23,594									

One 6-inch Gun was mounted at Durban and sent up to relief of Ladysmith Army, but as it weighed on its carriage 11 tons it was too heavy to be moved away from the railway; it fired about 200 rounds at very extreme ranges.

19015. I see a note in your *précis* "Seven-pounder gun sent with 25 men from H.M.S. "Tartar" to Pietermaritzburg, loss of gun"—That is the unfortunate gun that we lost, the only Naval gun lost during the war; it was a 7-pounder muzzle-loading gun, which was used only for short practice on board ship, and is practically obsolete. It was sent up by the senior naval officer there at the time for use against the Boers, and I immediately telegraphed to have it sent back again, but my telegram was too late. They used it in a truck, and the Boers mastered it with their rifle power, and captured it in the truck very soon after the outbreak of the war. That was a gun that never ought to have been used at all. It is a barbarous weapon.

19016. I see, on looking back, that you have a heading about the conveyance of Boer prisoners after Elands-laagte from Natal to Simon's Bay?—Yes; soon after the battle of Elands-laagte, I was approached by the High Commissioner, who wanted to know whether the Boer prisoners could be put on board a man-of-war. I said it was quite impossible, because there was no room or accommodation to put them on board a man-of-war on duty at Durban, but that, if he wished, I could accommodate about 200 to 250 as a temporary measure on board the "Penelope" at Simon's Town. I may add that at that time there was no possible arrangement on shore of any kind for receiving prisoners, and matters were so urgent that I thought it would be well if I put the "Penelope" at the disposal of the military; and we had, practically speaking, from 200 to 250 prisoners on board the "Penelope" for something like six months.

19017. Were those prisoners taken at Elands-laagte?—They were taken at Elands-laagte.

19018. Then, later on, what happened?—Later on they established a camp at Simon's Town, and we generally had two or three transports full of prisoners lying in Simon's Bay under Naval guard.

19019. They were all under your control?—Being afloat they were, to a certain extent. The ships were actually, as regards their internal discipline, controlled by the military, but I made myself responsible that the prisoners were not allowed to escape, and that my ships guarded and properly looked after them.

19020. And that worked well?—It worked very well indeed. I knew, of course, that it was wrong to put prisoners on board a ship at all—it is against one of the first articles of the Geneva Convention, and it was only on account of the extreme urgency of the case that I consented to allow them to be put on board the transport to be kept for any length of time.

19021. What is the objection to it?—The objection is that they are supposed to get sickly and overcrowded by being herded on ships for a long time, and that it is better to land them. I think that is the meaning of the article of the convention. It is really a remnant, I imagine, of the old French wars.

19022. Then you mention in your *précis* the stoppage of food and stores out of ships destined for the enemy?—It was very difficult to determine, in the first instance, as to whether food was contraband of war or not. I had two or three contrary instructions on the subject. At first we used to make all food supplies not actually contraband, but we used to make an arrangement with the ships to land them voluntarily, so that in

the case of all the first ships that arrived we made them land stores and things for the Transvaal or the Orange Free State, which had been shipped before the declaration of war, at Port Elizabeth, or East London, or Cape Town. Later on, after things kept coming on and consigned by our merchants, I suppose, in England, we made an example by capturing a ship, the "Mashona," and we put her into the prize court. She was not condemned, but much of her cargo was condemned.

19023. Only one ship?—We might have done it with many, but, as a matter of fact, the commerce was nearly all British, and we should have been robbing our own people. We have had so little war, that they seemed to think they might go on shipping things in that way for the enemy as if we were at peace.

19024. What happened? You did not let the things go forward?—They were all stopped at East London or Cape Town, or wherever it might be, and put into a big stores.

19025. For the owners?—For the owners, who got them again, or, probably, the consignees, who paid for them. A good many of them were innocent; the "Mashona" was not an innocent case, because they had a good deal of oil and other stores for the Netherlands Railway, which was one of our bitter enemies, so that I determined we would make an example of her.

19026. And were there any other things?—Simply flour, rice, wheat, and all sorts of luxuries—tinned meats and things of that sort, from America mostly.

19027. Generally speaking, most of them arriving at Cape Town?—Either at Cape Town, East London, or Port Elizabeth.

19028. But not in Natal?—No, not so much went to Natal.

19029. (Sir George Taubman-Goldie.) Are provisions contraband of war?—They can be so, or they cannot. It depends upon the action of the Power that decides. The Government decided that they were not, unless it could absolutely be proved for the use of the enemy in the field. As a matter of fact, the Boers were all under arms in the field, and under that heading we might have seized everything.

19030. (Chairman.) What about warlike stores?—Very few warlike stores came to the Cape Colony or to Durban. Some went through Lourenço Marques, and those that came to Cape Colony or Durban were always taken out by my ships. They were not really stores for the enemy in the field; they were sporting rifles and sporting ammunition chiefly, but a good deal of ammunition I know did go through Lourenço Marques in the early part of the war.

19031. And was any step taken to prevent it?—We did our best to prevent it, but you cannot break a ship's cargo in bulk on the high seas. My cruisers boarded every ship they could, and they always went to the manifest; but it is easy to have a wrong manifest, and very often shippers of cargo will not have any at all; they wait to get their manifest till they arrive. But I think we put a certain amount of fear into their hearts, and they did not bring things as openly as they otherwise would, but they very often disguised things; a great deal of ammunition I know went in the guise of potatoes through Lourenço Marques; but you cannot

Vice-
Admiral Sir
R. Harris,
K.C.B.

17 Mar. 1903

prove it, and also a good many small guns went through.

19032. (*Sir John Hopkins.*) What was your boarding limit?—I used to board anywhere outside the three-mile limit.

19033. (*Chairman.*) Then you had ships along the east coast?—I had five cruisers and gunboats doing searching party outside Lourenço Marques. It was really a blockade, but one does not like to call it a blockade, because it was a friendly port.

19034. (*Sir Frederick Darley.*) Under what flag did the ammunition come out to Lourenço Marques?—I think it came out under the German or French flag. I do not think any of it came out under the British flag.

19035. (*Chairman.*) There were alarms about privateers, I think?—Yes; there were many alarms about privateers, absolutely ludicrous many of them. Early in the war there was an alarm that one of the troop-ships had been chased by a Boer privateer somewhere off the Canary Islands; but it was absolute nonsense, although it frightened people a good deal.

19036. There were none?—There were none at all.

19037. Where there any points along the coast where warlike stores could have been landed, except Lourenço Marques?—Fortunately for us, there were none at all. Except under exceptionally fine weather, it is impossible to land things on any part of the coast, except at those towns which we held.

19038. (*Sir John Jackson.*) What about the west coast, Saldanha Bay?—I think it is quite impossible; they never would get things through the large sandhills that line the West Coast harbours, and Saldanha Bay was always under good observation by our own people. The only weak point would be at the mouth of the Orange River. Occasionally you can land things there in fine weather; that is a very unprotected part, and very small things might have gone through, but I doubt whether they did.

19039. You are not aware that any things did get through at those places?—No; but there used to be a great many scares about things going through German territory at a small port north of Walvis Bay; but the landing is very bad there.

19040. (*Chairman.*) You do not know that any of those articles got in from the coast at all?—No, I do not. I do not think anything got in, except through Lourenço Marques. There were two or three scares that they were putting things through the mouth of the Limpopo River, but I found that it was all baseless, and they said that things went through Beira, but I doubt that, too.

19041. And it was the duty of your ships at Lourenço Marques and other ports to look out for these things?—They were constantly employed in boarding and searching every ship. Every cruiser boarded some hundreds of vessels, and very arduous work it was, too. Of course, they were very much handicapped in this way—that the officials in Lourenço Marques, being very friendly, we were most careful not to offend their susceptibilities in any way.

19042. (*Sir John Hopkins.*) Did you board foreigners?—Yes; and we used to board the mail steamers until the "Bundesrath" and the "Herzog" cases, when the Admiralty telegraphed out that they were not to be boarded.

19043. Had you any right, under the conditions that existed then, to board foreigners; any absolute right, I mean?—I considered so, on the high seas.

19044. (*Sir George Taubman-Goldie.*) You had to pay some compensation, had you not?—We had to pay £25,000, I think, for the "Herzog" and "Bundesrath." I may tell the Commission that the information on which the "Bundesrath" and "Herzog" were captured was exceedingly good. We had information from a Dutchman, who was supposed to be loyal, that there were 7,000 saddles on board the "Bundesrath," and they were very much contraband of war, but they could not be found. In the other case we had information that guns were stowed away in the bunkers, but they could not be found either.

19045. (*Chairman.*) You say, also, in your *précis*, that gold was seized?—Yes, a good deal of gold was going out the whole time through Lourenço Marques, and we could have captured it easily, but it was decided by the Government not to make it contraband of war.

19046. That would be gold exported?—Yes. We also

seized specie. We seized about £25,000 or £26,000 worth of Kruger sovereigns out of the "Avondale Castle." I may say that the Castle Company then were absolutely blameless in regard to their part of the transaction; they had permission from someone in Natal to ship it. These were 26,000 Kruger sovereigns that were being taken round to Lourenço Marques, where the coin is not in circulation, for the use, no doubt, of the Boers. After it was on board information about it was telegraphed to me. I telegraphed immediately to Lourenço Marques, to one of my cruisers there, and they stopped the ship before she got into the three-mile limit; they sent the ship back to Durban, where we took the money out, so that the money never did reach the Boers.

19047. (*Chairman.*) Is there any other point that you wish to mention?—I think not; I think I have dealt very fully with most of the points.

19048. (*Sir George Taubman-Goldie.*) We have heard a good deal of the advantages that there would be in keeping a large portion of our Army in South Africa. From your own experience, would you say that we could find transports on the spot, as a rule, to take them to other parts of the world in case of a sudden outbreak of war?—Not immediately.

19049. I mean immediately?—Not immediately.

19050. We should have, probably, to send transports out from England, should we not?—I think we should. From what I know of the trade of Port Elizabeth and Cape Town, I think you could lay hands on half a dozen steamers at once.

19051. But not enough for one or two Army Corps?—And they would be very poor things as a rule. It is not every steamer that is fitted for carrying troops; probably you could get hold of two or three good mail steamers and three or four more vessels, but I think that the bulk of the transports would have to come from England, or be sent from India or some other place.

19052. They would have to come from outside?—Yes.

19053. We are frequently having small expeditions in different parts of the world near the sea coast. There is always a difficulty in sending troops, because of dislocating the linked battalion system. Do you not think that if we were to increase the Marines it would be possible to use them more than we have done in the past?—Yes, I think so. I do not know whether you would get enough of them; I fancy it is rather difficult to fill the corps up at present.

19054. They are capital troops?—Yes; they are capital fellows.

19055. And they could easily be landed from the ships; they are in the ships ready?—Yes, they are always available.

19056. (*Sir John Hopkins.*) With regard to the guns that were landed by you in Natal and at the Cape, of course you had reports about them?—Yes.

19057. Were those guns, so far as you could judge from the reports, efficient as guns of position on all occasions, so far as you heard?—All the reports that reached me in the earlier part of the time were that the guns that were first landed were most satisfactory. Later on the guns were shot out, and had to be replaced—a good many of them.

19058. Did you replace many of them?—Yes; the guns were constantly being replaced. As a matter of fact, some of the guns that were first sent were not new guns; they were guns taken out of the ships, which had fired 200 or 300 rounds before they got there, and 300 or 400 more rounds made the guns practically smooth bore. The full charges of cordite wear out the rifling so rapidly that you cannot expect accuracy after 550 rounds, and it gets more and more inaccurate till it gets to 700 rounds, when they have to go into store again.

19059. Were you able to replace those guns at once?—Yes, by taking them either from ships or from store. The moment there was a complaint about a gun I had it sent back to Durban and a new gun sent in its place.

19060. We have had some evidence about the 4.7 gun in Ladysmith, to the effect that the firing was very erratic, to say nothing else of it; in fact, a rather condemnatory report of the practice as shown by the seamen gunners there. Did you hear anything about that?—No; I always heard that the reports had

been regarded as satisfactory. I conclude that towards the end of the siege the guns were getting a bit worn.

19061. And also that, at those excessive ranges, they were hardly fair on the guns?—I do not think the way the guns were used was at all fair. They were all expected to fire up to 7,000 yards and 8,000 yards, and the range the guns shoot well at is up to 4,500.

19062. They were used beyond their normal power?—My own private naval opinion is that to use the guns effectively they should be used at 5,000 yards, and not more, if you want to get good useful practice out of them.

19063. And there were other conditions, also, that affected accurate shooting, were there not?—There is no doubt that at the beginning of the war the very rarified air out there did affect the guns considerably; the guns were over-sighted, and the fuses were long, and burnt very much slower or quicker, I am not sure which. At any rate, they had to make considerable alterations to make them burst properly. I think they had to shorten the fuse a bit.

19064. Your Naval 12-pounders have fuses with a much longer range than the Army field gun?—Yes, they have, much longer. I think the Army field gun did not burst shrapnel beyond 2,500 yards originally, but they have increased it now.

19065. You did not hear anything about the effect of the ammunition used; that is to say, the difference between, say, common shell and shrapnel shell?—Yes; I made very careful inquiries as to that, and I think it varied according to the nature of the ground. If you were firing against rock, lyddite was very effective; if you were firing against ground not so hard, it was better to use common shell with a powerful burster, and against the Boers in trenches it was better to use shrapnel. I saw some of the Boer prisoners who came down after they had been damaged by lyddite, and they were very curiously coloured; three or four of them were yellow and green and all sorts of colours from the lyddite.

19066. Would you not think it absurd if you were told that a seaman gunner on a fixed platform, at a fixed object, could not make an accurate shot?—It would be absurd. When our men came back I asked them about it, and they said that the shooting on shore was child's play compared with the shooting afloat. The object does not move, and you have your own time, and can do what you like.

19067. The guns were all fitted with telescopic sights?—After the first guns they all had telescopic sights; we fitted them temporarily at once there.

19068. With regard to transports, were you satisfied with the way they were worked generally, from a naval point of view?—In the case of all that came under my supervision at Cape Town and the other ports, I think the Transport Department was very well worked indeed.

19069. There was a great accumulation of stores at various places, which could not be helped?—Yes. Cape Town Docks is a most awful place. Things are hung up there for months very often.

19070. But that could not be helped?—No. And the confusion, of course, was tremendous, owing to the war, all through the Colony. I may say, for instance, that I sent a truckload of 150 lyddite shells to Lord Methuen, which was absolutely lost for three weeks. He could not find it, and wanted to know where it was, and I telegraphed to say that I sent it. That shows that things were in a very confused state when you lose a truckload of lyddite shell.

19071. (Sir John Jackson.) I think you told us that you had no instructions as regards any preparations until immediately preceding the declaration of war?—That is so. I may add that the Admiralty were pretty well aware that affairs were critical, because the orders given to me were that I was not to be absent from the Cape later than September. I was on an East Coast cruise when I got this information on the way up, and my orders were that I was to be back at the Cape in September.

19072. So that, although you had not actually had instructions to prepare, you had had instructions to be ready?—I had, at any rate, a very good hint to be ready.

19073. Were there many facilities for dry-docking naval ships at Simon's Town in your time?—No; there was a small slip at Simon's Town, which would haul up a gunboat up to about 1,200 tons.

19074. Then, when you required to dock one of the big ships, where had you to take it?—It had to go to Cape Town.

19075. Are there any dry docks at any of the other ports in South Africa?—No. I think they have a dock or slip at East London, I am not sure which, but not an important one.

19076. Not sufficiently large for a line of battleships?—No.

19077. Now, with regard to the transport and the difficulties that occurred in connection with it at Cape Town, would it have been practicable to have landed part of those materials at Simon's Town and to have taken them by railway from Simon's Town?—Yes, it would; but the facilities for landing stores at Simon's Town in any quantity are very poor. It is very much easier to clear a ship alongside Cape Town Docks than at an anchorage at Simon's Town.

19078. But assuming that they could have got ashore at Simons Town, you do not see any reason why they should not have been carried along the railway from Simons Town to Cape Town?—No, it could have been done so, but it would have been a very awkward proceeding. At Simons Town you have to land them at the dockyard or at the town pier, and then take them by road to the railway. They do not go straight into the truck.

19079. (Sir John Edge.) Do you find that there is any element of error in the shooting of a naval gun; in the gun itself?—No; I think that, as a rule, our guns are very accurate indeed; sometimes the sighting may be a little wrong, but it is generally put right.

19080. Assuming the sighting to be right, you do not find any element of error?—No, the guns are very accurate indeed; the powder charge varies sometimes; the cordite has the peculiarity of increasing its strength and pressure in very hot weather, which has to be allowed for.

19081. Is it within your experience, I mean, that a shot fired from one of these naval guns within the normal range may fall 200 yards short without fault on the part of the firer?—No, not at all. As long as the bore of the gun is good, I consider that the guns are very accurate indeed.

19082. How about the difference in power of the cordite itself?—The cordite gets a good deal stronger in hot weather, and in cold weather it gets weaker. I think it burns with much more rapidity with a temperature over 80 degrees.

19083. With a new gun would there be any difference in the firing within the normal range of one of the naval guns with cordite in hot weather?—Certainly, at long ranges there would be a difference.

19084. Would it be liable to shoot over?—It would be liable to shoot over if the weather was hot and dry.

19085. And in cold weather?—It would be liable to shoot rather short.

19086. (Sir Frederick Darley.) After the declaration of war, do you think that the Boers got much ammunition through Lourenço Marques?—Not a very great quantity, I fancy, but it was going through, no doubt. That was eventually stopped altogether, because the Government found that it was impossible to make quite certain of the vessels being searched at sea, and also that the Customs at Lourenço Marques were not quite trustworthy. We sent a very efficient man there, Commander FitzCrowe, who was given very large powers, and was able to buy up nearly everything, I fancy. He got complete touch of things, and after he arrived there I think very few things went up.

19087. Do you think they got many guns after the declaration of war?—No, they might have got one or two through, perhaps, in the first part, but not later, and no very big ones either. The guns that went through were probably pom-poms, or something of that kind.

19088. Then in point of fact the bulk of the ammunition that they had and the guns that they had were all there before the declaration of war?—Yes, they were very well stocked indeed; there is not the least doubt about that.

19089. (Chairman.) Had you control over the transport service?—As a matter of fact, as Commander-in-Chief, of course, I had, but the officers in charge were so very competent, and my own work was so very great, that I was glad to let them have as free a hand as possible. Occasionally I moved a ship about when necessary, or I took one for my own purposes, but, as

- Vice-Admiral Sir R. Harris, K.C.B.*
17 Mar. 1903
- a matter of fact, Sir Edward Chichester controlled the whole thing at Cape Town, and very well indeed, too.
19090. You were conversant of everything?—Yes, I was in touch with him by wire or telephone the whole time.
19091. And you think it was all very well carried out?—I think it was all very well carried out, indeed.
19092. Do you think that the system under which transport is done by the Admiralty is a desirable system?—Yes, so far as I saw it at the Cape it was very well done indeed, and I think it is a desirable system.
19093. There has been some criticism as to delays, but I suppose that is inevitable?—Yes. I think the way in which the troops were brought out and the safety of the transports was wonderful, considering the many hundred troops that they took; only one transport was lost, and that got ashore.
19094. But there were cases of ships on which demurrage had to be paid?—Yes, there were one or two cases I know; one or two rather inferior vessels were taken on at one time, but they were quite the exception. The majority of the ships that they came in were very fine ships, and very well fitted for the work.
19095. We have had evidence with regard to some of the ships that they were kept purposely in consequence of the representations of Sir Redvers Buller; were you cognisant of that?—I was not. I allowed Sir Edward Chichester a very free hand in that matter, and I did not detail to him what ships he should lay up, and what ships he should send down. I had not time to do it.

Rear-Admiral the Hon. HEDWORTH LAMBTON, C.V.O., C.B., A.D.C., called and examined.

- Rear-Admiral the Hon. Hedworth Lambton, C.V.O., C.B., A.D.C.*
19096. (Chairman.) We have had evidence from Admiral Harris just now with regard to the steps that were taken for sending up officers from the Navy in South Africa, and I do not think we need take you through that in detail. Perhaps you would tell us shortly the steps that were taken with regard to the detachments which you went up to command at Ladysmith?—Do you mean before we got there, or after?
19097. I mean before, in the first instance?—I have made out just a short précis: "September 24th, 'Powerful' left Singapore; October 3rd, arrived Mauritius; war rumours serious; bought up all available khaki; found half battalion Yorkshire Light Infantry; suggested taking them to South Africa. War Office approved. October 10th arrived Durban; ordered to Cape Town. October 13th, arrived Cape; disembarked troops. October 17th, 'Powerful's' marines and one 8-pounder and crew landed under command of Commander Ethelston"—that was for the other Naval Brigade.
19098. That went to Stormberg?—That went to Stormberg. "October 26th, 'Powerful' left Simons Town about midnight with two spare 4.7 guns belonging to third-class cruiser 'Philomel'"—they were taken out of the dockyard—"with fittings designed by Captain Percy Scott, of H.M.S. 'Terrible.' October 29th, arrived Durban; disembarked with Naval Brigade, consisting of 283 officers and men, and started about 7 p.m. for Ladysmith"; we had two special trains waiting for us. "October 30th, arrived Ladysmith about 9.30 a.m., and found battle of Lombard's Kop in progress. No instructions had been left as to disposal of Naval Brigade, so, having borrowed a horse, I accompanied Colonel (now Sir Edward) Ward to Observation Hill, and after an interview with Colonel (now Sir William) Knox, R.A., who had been left in charge of Ladysmith, at his suggestion I took the three long 12-pounders, with a company of bluejackets, to a position to the left of Limit Hill. I should have mentioned that whilst my brigade was detraining, Long Tom (96-pounder), on Pepworth Hill, commenced shelling the train, but no damage was received. On arrival at position indicated, but before the guns were unlimbered, an officer of the Devons came to me from Limit Hill and said I had better turn back, as a general retirement was ordered. As this was evidently in full swing there was nothing to be done but to slowly retrace our steps along the New-castle road. The long teams of oxen laboriously dragging our guns afforded a tempting mark to Long Tom, and, after some good shooting, he succeeded in pitching a shell under the leading gun, upsetting it, and seriously wounding all the three men in charge of it" (they only have three men, these 12-pounder guns), "the oxen and Kaffir drivers bolting into the town. Took up a position with other two guns on slope, and commenced duel with Long Tom, which, after some most brilliant shooting by Mr. (now Lieut.) Sims, gunner, ceased firing for the day (this was about 1 p.m.). Sir George White personally warmly thanked me for the timely assistance so unexpectedly afforded him." That is up to the arrival at Ladysmith, which is what you want.
19099. What exactly was the force you took up?—283 officers and men. We had two 4.7 and three long 12-pound 12-cwt. guns, one short naval gun, one 8-cwt. and 4 Maxims, 270 men and 13 officers, including midshipmen.
19100. After that you took part in the general defence of Ladysmith?—Yes.
19101. Have you anything to say with regard to the dispositions in regard to the Navy?—I suppose you all know that there was rather a state of depression and gloom in Ladysmith after the battle generally called "Mournful Monday," which arose entirely in this way. Of course, they had had some rather nasty knocks before; they had been shelled out of Dundee, leaving their wounded there, including General Penn Symons, and they had also lost about 800 men on "Mournful Monday," so that there was a general feeling of depression amongst the troops from the General downwards. Ladysmith was looked on as a second Sedan. I do not know whether anybody here has been to Ladysmith.
19102. (Sir George Taubman-Goldie.) Yes?—Then you know what it is like. I have here a raised plan constructed by Major Mahon, R.A., who was at Ladysmith (*producing the same*). Ladysmith is very low lying, and these mountains, Pepworth and Surprise, were rather higher than they are on that plan, and with Bulwana and Lombard's Kop dominated the town completely, and there were no defences of any sort or kind to start with. What really caused the depression was the extraordinary ignorance of the power of Long Tom. So far as I can make out there was hardly a single soldier who had ever seen a big gun, and the exaggerated apprehension of this gun was really very marked. I have brought here a caricature book which was got up to relieve the tedium of the siege, which shows the feelings very well; it is rather an interesting book, got up by one of Sir George White's aides-de-camp, showing the difference between the first shell and the last shell (*handing in the book*). Why I produce this is because it is important from my point of view to explain what was the cause of that feeling. Between the feelings as depicted between the first picture and the last picture there was gradual change, of course, but in the first few days I think the majority of the people thought they were like rats in a trap, and that there was nothing to do but to "die in the last ditch."
19103. Owing to the long range fire?—Owing to their ignorance of it; that is the only word for it. Well, I may say that this feeling was not shared by the Naval Brigade. We have been brought up with big guns all our lives, and, as Sir John Hopkins will tell you, we look upon those guns for modern ships as really rather small—hardly a big gun at all. I saw Sir George White the following day, and I assured him I was absolutely certain from my knowledge of these things that there was no danger whatever of the town being taken except by assault; and I have here a private letter which I got after the siege from a very distinguished military officer, which confirms what I have said, as you will see by the expressions used (*handing in the same*). I must apologise for bringing this personal matter about myself in, but as the siege wore on I dare say a great many people rather forgot what their original feelings were, and in justice to my brigade it is only fair that I should point out what the position was, as my officers and men were the people who had at first to bear the whole brunt of the bombardment. For some years past the War Office had abolished all forms of shell excepting time shrapnel for the field artillery, so that the result was that those officers—and probably a more gallant lot of officers never existed—had never seen any guns fire at positions at all. I believe I am correct in saying that in those days certainly it was no part of an infantry or

cavalry officer's professional duty to know, even theoretically, anything about big artillery, and I am not certain whether that does not remain the same to this day.

19104. Then you think that the effect of the Boer long range guns was exaggerated?—Considering their small number. I say it is astonishing that anybody could suppose that these few guns could do more than kill a certain number of people, which is all they did, of course.

19105. And did they do very much material damage?—Every now and then there was something terrible. On one or two occasions one shell would kill seven or eight straight off, but, as a rule, it has always been the case in warfare that shells frighten people more than damage them.

19106. But we have had some evidence with regard to these guns of the Boers that they used them for such very long ranges that the effect of the shells was minimised altogether?—I do not know who could have given you that evidence. In what way do you mean, because if a shell bursts once it bursts, and it makes no difference whatever whether it comes five miles.

19107. I understand that the depression to get the long range made the shell drop so vertically that it did not burst with the same effect?—Very often the shells from "Long Tom" did not burst at all.

19108. (Sir Frederick Darley.) And if it does burst it goes so far into the ground, coming down from a great height vertically, that it has no effect; it simply blows up?—Well the ground in Ladysmith was tremendously hard, and they did not penetrate much; but shell fire—at least those small things like 6in.—never has done much damage. Why should it? It has only a small bursting charge. If you do get it into the gun it is another thing. For instance, my lieutenant, Egerton, was killed on the second day by a plump shot into the embrasure of our gun.

19109. (Chairman.) Of course that may happen?—Yes.

19110. Did it often happen?—That was the only time I am thankful to say. It was the only time they got into our embrasures, that is with a Long Tom.

19111. And the range that you had to fire in order to compete with the Long Toms was also rather a long range for your guns, was it not?—Up to that time I presume it was by far the longest range that people had ever fought at.

19112. Did it diminish the effect of your fire?—It made it much harder to hit of course, the range varying from four to five miles. I do not know whether you know what the Long Toms were like. They ran up—they were disappearing guns; they had every advantage; they ran up to fire, and if we fired they disappeared. During the first part of the siege I attempted to keep their fire down by firing as soon as the smoke of their guns was visible. But I must explain to you that our projectiles having a lower trajectory used to be about two seconds quicker than theirs, so that with the gun laid on Long Tom, if, as soon as we saw their smoke, we fired instantaneously, we probably lost half a second, but we got in always a second and a half before they did, which was very distracting of course to the Boer gunners.

19113. Do you think that the practice made was good?—I do not think anything about it. I am quite certain; it was brilliant in the extreme—shot after shot. On the second or third day of the bombardment, after a short time, a very good shot was put into the embrasure of Long Tom on Pepworth Hill, and they hoisted the white flag, which I immediately respected, but after twenty minutes or so they began firing again. I wrote an official letter to Sir George White, requesting him to communicate with General Joubert, and claim the gun, as hoisting the white flag at one battery whilst firing from other batteries was still continuing meant that that gun had surrendered. I did not quite anticipate that he would do it, and I do not think he did, but it rather cheered people to know that these things were going on. In fact, it was only our scarcity of ammunition that prevented our keeping their fire down altogether.

19114. You had some difficulties about that?—It must be remembered that when Admiral Harris sent us away from the Cape we had 300 rounds for each big gun, and of course it entered nobody's head in those days that Ladysmith was going to be invested, and there was no idea of the guns being cut off from their base. After "Mournful Monday" I telegraphed at once to send up

every available round they had at Durban, but the railway was cut before it could come up.

19115. Was that the amount you had—300 rounds?—300 rounds for each big gun.

19116. So that you had to husband it all through the siege?—Yes; which siege of course was of unknown duration.

19117. What did you do to bring that about; did you lay down rules for the gun firing?—The first day after we arrived there in Army Orders I was put directly under Sir George White; that is to say, the Naval Brigade received their orders direct from the General Officer Commanding, Sir George himself, of course. And I may point out that with the exception of General Hunter, I was a long way senior to every other officer at Ladysmith by relative rank. We were always on the most friendly terms with the whole garrison, a most delightful set of people; and I used constantly to be seeing and talking with Sir George White, and we both thoroughly agreed on the principles on which the naval ammunition should be expended. He left it to my discretion entirely, and there was not a single shot fired throughout the siege without my permission.

19118. And you regulated it according to the circumstances of the day?—Yes, to the daily circumstances; that is to say, after the first two or three days. At the very beginning, before one had quite realised that we were likely to be there for some time, we fired round for round. On November 2nd, which was the day Lieutenant Egerton was killed, we fired 40 rounds; I am only talking of the big guns; the 12-pounders were no use at those very long ranges—or very little use—except on the very first day; but I am talking of the 4·7, the main guns. On November 2nd I say we fired 40 rounds, on the 3rd 20 rounds, on the 7th 36 rounds, on the 8th five rounds, and on the 9th 39 rounds. There was a regular attack on the 9th on the town; it was the Prince of Wales' birthday, and with Sir George White I had arranged overnight, according to our naval custom, for a royal salute at noon, a shotted salute, an interesting thing to fire. Only four out of those 21 shots were fired from the 4·7; the remaining 17 from the 12-pounders, and with very great success. It cheered the whole of our camp enormously, and irritated the Boers extremely, which was a pleasant thing to do. I should like to point out, if it has not already been done, the great difficulties that my men had in fighting these guns compared with ordinary guns.

19119. If you please?—I do not know whether any of you have seen pictures of the guns, but I have brought a book here which shows them pretty well, and a magnifying-glass (*producing and explaining the same*). The chief difficulty we had to contend against was the alteration in the power of the cordite, the changes of temperature were enormous; it was constantly well over 100 degrees in the shade, and thermometers were so scarce in the town that I did not like putting mine out in the sun, because it might have burst, and I do not know what it would have run up to, and at night it was always cool.

19120. And that affected the cordite?—It affected the cordite tremendously. Between the early morning and the middle of the day, in the extreme heat, the range used to vary 500 or 600 yards, so that you may say that although the distance between any two fixed guns naturally always remained the same exactly, the range was invariably inconstant—it was never the same. It changed day by day and hour by hour. Lieut. Halsey, who fired most of the rounds, was up at Cove Redoubt. He was a very good rifle shot, and that gun fired about 420 rounds, of which he himself at least fired 400. I have a long paper from him here, which I can put in if you like, which he sent to me a day or two ago, or I can read extracts from it.

19121. Will you give us anything that is material?—He is now Commander Halsey of the "Good Hope." I will read some extracts: "It was found that the ranges varied very considerably with the atmospheric conditions, and in one single day a difference of as much as 600 yards has been used when firing at a mark 9,000 yards away with equally good results. As to the results of the naval guns' shooting, it is hard to say what actual damage was done, but there is little doubt that the 4·7 at Junction Hill damaged the 6-in. on Pepworth Hill. Reports from the Manchester Regiment camp on the east end of Caesar's Camp were continually received, and on several occasions they reported actual hits, and further, that they could see stretchers being carried along as the results of these shots." There is a good

deal more here, talking about different hits, but I do not know whether you require to have it or not.

19122. Generally, I understand they bear out your statement that the practice was good?—The practice was good. I was astonished at it. I was very much pleased, and I am not a person who is very easily pleased either. If there were any possible doubt in anybody's mind about the shooting of the guns, supposing there were any such thing as envy there, it should have been completely extinguished on December 8th, 1899. On the night of the 7th of December, as everybody here is probably aware, there was a brilliant sortie conducted by Sir Archibald Hunter, with a force composed of Colonials and Imperial Light Horse, which resulted in the capture of a gun on what was called Gun Hill, or Lombard's Kop, and a letter was found in a tent along the kopje by Major Karri Davies, who was in command of the Imperial Light Horse, and in the evening he sent me this translation—I will read the material parts. The letter is headed: "Ladysmith, Natal December 7th, 1899. Mrs. P. J. Groenewald.—Dear Sister, . . . It is one month and seven days since we surrounded Ladysmith, and still don't know what will happen. We see the English walking about all over the town every day, which we are bombarding with our cannon, but it would be very dangerous to attack the town, as they have several sinegas outside the town. They have two of their naval guns close to the town, which give us a very warm time, at times unbearable on account of the excellence (of the guns). I think a good deal of bloodshed will still be caused by their shells before the time comes of their surrendering, as Mr. Englishman fights hard and well, and we burghers are a bit shaky." I think after that letter was received, which was sent up to us, there can be little doubt what the Boers thought, and they really were the best judges as to whether our guns were doing any damage. I have a great contempt myself for small guns, and we would not allow a gun under 4·7 on to a first-class cruiser or a second class cruiser, but considering their size, I think their performance was marvellous.

19123. Your positions, too, were inferior to those of the Boers?—Yes, because they had every advantage. They could see the effect of all their shell, as they were firing down, whilst we were always firing up hill; we could see what was short, but if the shell went over it was impossible to tell how far it went over. And the Boers had unlimited ammunition against our extremely limited ammunition, and of course the first shot every day of ours was invariably only a sighting shot. It must be remembered, too, that probably the people who saw most of the shooting were the war correspondents. They had nothing else to do; they used to go and sit on the kopjes with telescopes and look at the firing. Other people, of course, had their business; for instance, Sir George White and General Hunter and the Staff, after the first month, all moved to a position behind Convent Hill, from which they could neither see nor be seen from either Bulwana, Pepworth Hill, or Gun Hill. They had had a shell into their own headquarters, so that it was necessary for them to go away; the result was that they could not see the shooting. I have mutilated three or four books by cutting out the remarks made by some of these people. When I stood for Parliament I said quite innocently, what was quite true, that the military guns could not go half-way, which was the absolute fact—it was nobody's fault at Ladysmith. I said they were no use, and I suppose it was because I said that that certain people said the naval gun were not any use at all out there. There is one thing to be said; the Boer guns never silenced us, and we constantly silenced them.

See Q. 1467. 19124. (Sir John Hopkins.) In connection with the shooting of the guns I should like to read you some remarks that were made by General Hunter. He was asked "Have you any other remarks to make upon the guns," and his answer was "I think our guns were up to their limit of range, very good. Our gun laying in the Army, judging by comparison, and so on, is infinitely better than the gun laying in the Navy. I know I am treading on very delicate ground when I criticise naval gunnery; but I say, and I know that it will not be contradicted by a great many men who were in Ladysmith, that the naval gunnery—" Then he asked, "Is it within my province to say this here?" And he was told "Yes, I think it is?" He went on, "I ask because what I say will raise a tremendous storm of indignation; but the naval gunnery left everything to be desired. The naval guns were fired from fixed

permanent platforms; there was no motion in the platform to disconcert the gunners, but the practice made with the naval 4·7's was—I do not want to use too harsh a term—well, it was such that I offered to take the girls out of the school to come and serve the guns, and make as good practice. I do not know whether that is not saying a very harsh thing, perhaps. Q. But was that exceptional? A. There were only two of them," and I think it is only fair that we should draw from you all we can to prove or disprove that. Is there any truth in that statement?—None whatever.

19125. Then Sir Frederick Darley asked "May the light have had anything to do with that—the clearness of the atmosphere?" And General Hunter answered, "But this did not extend over one day, it extended over the whole of the siege; they never profited to-day by the experience of yesterday. And they were firing off a fixed platform at a fixed target, not a moving target, as the Boer guns did. Q. At a known range. A. Yes, at a known fixed range. It was the same, probably, for more than a month—the Boer gun was in position in the same place, it never changed"—Of course he shows himself to be an extremely ignorant man. He is a very gallant man, but it is bravery and stupidity combined in his case. He talks about a fixed range when the range was always varying. There were several numbskulls there, and apparently he is one of them, who had not sufficient intelligence to understand that though the distance was always the same the range was always altering. General Hunter is a very young general, and a great friend of mine, at least I thought he was, and a very brilliant man; but I do not suppose he had ever seen a big gun before, and he certainly knew nothing whatever about the shooting—the firing. You cannot make any comparison whatever between military and naval shooting. The military shooting you may say is like a man going out in a duck punt and firing at a flock of duck. They only have time shrapnel; you all know what time shrapnel is; they burst it; they do not try to hit any one object. Our shooting is shooting as a rifle is shot. You cannot compare the two things at all; it is ludicrous; there is no possible comparison. The military never fired at a mark at all; they fire in the air. I am not going to follow his example. I have not a single word to say against the Royal Artillery. Judging from the few opportunities they had, nothing could have been better than their shooting. For instance, in the attack on Caesar's Camp and Wagon Hill it was beautiful, but it was only at very short range. They could not go half way to the guns which we had to reply to throughout the siege, and I do not know whether General Hunter is a man of any memory or not, but he did not express those feelings in Ladysmith. I should like, if I may be allowed, to read a few things from people who can be called upon if necessary, which I have cut out from their books. I never met them before, and I saw very little of them, but I should like to read what they say.

19126. If you please?—Because after all they could see it better, and they had nothing else to do, and it is their business and duty to report truthfully on these things. I will commence with Mr. Pearce, the "Daily News" war correspondent. It begins rather oddly: "Killing three men of the Liverpool regiment and wounding eight." That refers to some shot of Long Tom. "This is the most fatal half-hour we have experienced since the siege began, but there was one lucky escape from a shell which burst in the guard tent among four men without hurting any of them. For the depression caused by these serious casualties there is some consolation in the rumour that Long Tom, of Pepworth's, has been knocked out for good and all. At any rate, his last shot into the town was answered effectively by the naval 4·7, which sent a shell straight into Long Tom's embrasure, and he has not spoken or given any sign of life since. Without wearisome iteration it would be impossible to do justice day by day to the good work of the Naval Brigade under Captain Lambton. Without the heavy guns of H.M.S. "Powerful" our state here would be much worse than it is, and everybody in besieged Ladysmith appreciates the bluejackets, who are always cheery, always ready for any duty, and whose good shooting has done much to keep down the fire of Boer artillery." Now, I will take a passage from a gentleman I do not even know by sight, called Macdonald, who wrote rather a good book called "How we kept the Flag Flying." He is an Australian. "Finding the most dreaded of the naval guns silent,

they sought to smother it up with weight of iron, and quite one hundred rounds must have been fired at it, one of the Boer 6-inchers being busy all day, and the scream of its shell splinters flying off the rocky hill had become a characteristic note in the siege of Ladysmith. The day's experience sufficed to show how badly we should have fared without the help of the naval artillery from the "Powerful." To use a current siege phrase we should have been 'blocked out.' I expect he meant knocked out. However, he says "blocked out," so we had better put it in. This next is referring to a little morning amusement we had; it is by the same writer: "Captain Lambton of the 'Powerful,' asked permission to give them a few shells on the morning of the 28th, and as soon as there was enough light to lay a gun on the thorn plot the Navals opened with a swift and sudden storm of metal."

19127. (Sir George Taubman-Goldie.) Is this Macdonald, too?—Yes. "There had been heavy rain during the night; the air was clear, and the moon still luminous, when the crash of our guns brought the people of Ladysmith tumbling out of bed in the fond hope that the relief column, so often in their minds, was at length within their field of vision, for the echo of the few guns rolling, ringing, crashing down the valley made the din of a general engagement. Those at Intombi Spruit, who were close enough to see the result of the fire, saw that it must have been disastrous. They saw one man—the first riser in the Boer camp—walk out into the open, and stretch his arms. He heard our shot, and turned to look at the redoubt above him, then realised that it was coming his way, and tried to dart for shelter. He was too late, and when they saw him last, as the shell burst, he was whirling through the air" (that was from Intombi Spruit; we were always getting stories from Intombi Spruit). "Four shots were fired in about twenty seconds, a proof of what the 'Powerful' guns could do with ammunition plentiful, and then it was all over, and a crowd of Boers were hurriedly saddling up and flying round the shoulder of the mountain. After all it only squared a bloody debt, standing over from the day before. The Liverpools had had so little respite in their exposed position that a few days earlier the Devons took their trenches, on Helpmakaar ridge, nearest to the Bulwana guns. The officers of the regiment were sitting in their traverse on Wednesday morning, when a Dutch shell just cleared the edge, killed Captain Dalziel, who was seated at a camp table, writing a letter home, and wounded nine other officers." That is the thing I referred to earlier; as a rule they did nothing; but sometimes that sort of thing happened. Here is another interesting piece from the same author. I must tell you that I myself, and nearly all my officers, were very weak at the finish; we had 95 per cent. of our people sick at one time or other. Of course, most recovered, but at the end of the siege we had hardly anybody left. I had only Lieutenant Halsey, a gunner and a couple of midshipmen fit for anything, and unfortunately I had a small touch of fever myself, so that I could not go and see anything of these things as I wanted to do. Especially I had wished to examine Bulwana, but this describes Mr. Macdonald's visit. "On the morning after the Volunteers entered Ladysmith our first thought was to determine whether the coveted Long Tom, which had done us so much damage from the crest of Bulwana, had really been taken away, and at the first break of day Alick Macpherson, one of the local guides, led a party of men up its steep sides. We crossed without a challenge the mimosa flats, upon which to venture any time this last four months meant death. Not a Boer was to be seen upon the summit; the position had been hurriedly and completely evacuated. Within fifty yards of the Dutch gun pit, and on the Ladysmith side of the mountain, lay a gruesome relic of hostile occupation in the body of a swarthy Boer, who must have been dead quite three weeks or a month, yet partly sheltered by a thorn bush, had lain there unburied, without his comrades on the top being aware of it." It must have been one of the short shells that caught that poor wretch. "Nearing the top of that hill, upon which our eyes had so long been covetously turned, eagerness to be first overwhelmed every other consideration, and there was a unanimous rush for the redoubt. It was empty; our night bombardment had been futile; the gun—for which Ladysmith would have given much as a relic of war—was gone, and everything else had apparently been left. In

the magazines were 250 rounds of shell, which a few days later we destroyed. The cases of Mauser ammunition must have reached tons in weight. Even their search-light remained, though the engine was missing. The redoubt was less formidable than it looked in the distance. The top wall of earth was 11ft. thick on the crown, enlarging towards the base. It was heavily faced with rough stone, upon which was the mark of many of our naval shells. The 40-pounders had evidently not been heavy enough to do it great damage." Of course, it was nobody's fault. We hit it; that was all we could do—we could not do more than hit it. Now I have an extract from another gentleman, I think Mr. Stuart of the "Morning Post," in a book called "Pictures of War." This refers to when we came into Ladysmith for the first time. "I shall never forget my feeling of pleasure, of unmitigated delight, when I heard the sharp loud smack of the first of the new guns. The shell dropped just short of the parapet, with a slight inclination to the right. The moral effect on the straggling Tommies was immense. In three minutes they were cheerful, hearty soldiers again, whereas before they had carried the aspect of dejected punters after a bad day at Epsom. The second shot overdid the thing slightly, but it was a very pretty shot. The third, I fancy, was fired by the gun that had gone off first, for there was some error that took the shell to the left. 'Long Tom' had already found his enemy, and gave him a couple in reply. I was not able to observe their effect, as they both went over the hill into the town. The fourth naval shot was as neat as anything I ever saw in my life. It did the trick right handsomely, making a big hole in the embrasure, killing and wounding several gunners, and making a mess of the gun carriage." (I do not know who told him it killed the gunners.) "In spite of several invitations to renew the duet, 'Long Tom' announced by his silence that he was closed for alterations and repairs, nor did he reopen until the next morning." The same author, referring to the death of Lieutenant Egerton, said:—"The Navy has lost in him a promising and popular officer. I am told that he bade fair to be one of the finest gunnery officers of his day." (That is quite true.) "But his comrades are men of the same pluck and of little less ability. 'Lady Anne,' the gun of which he was in charge, is now under the care of Lieutenant Hodges, and is making some remarkably pretty practice. Friday opened well with an artillery duel, in which the Boer shooting was nothing like so good as it had been, though the shot that killed Mr. Egerton landed within 4ft. of the muzzle of 'Lady Anne,' a name given to the gun by the sailors, while the soldiers called it 'Weary Willie,' because it does not fire as often as they would wish." I may say that if I had fired as often as I was wanted to do we should have been like Mother Hubbard's cupboard before we had been there ten days. "Captain Lambton follows the naval plan, and he always succeeds in preventing the enemy from watching the effect of his shot. Moreover, it is never desirable to waste ammunition. At one point on Friday afternoon 'Long Tom' was put out of action again. It was impossible to tell what precisely happened, but the gun carriage was struck or else several of the gunners were wounded. A white flag was promptly run up." (That is the same instance I was talking about just now.) "Now in a civilised country that would have indicated the surrender of the gun, but the Boer gunners did not appear to think so, for within 20 minutes they aimed shot at the gun that had already dismantled theirs and might have finally put them out of action but for the signal of surrender."

(Sir John Hopkins.) I should think, Lord Elgin, that would satisfy us all so far as outside opinions go.

(Chairman.) I should think so.

(Witness.) I have a good deal more, but it is all the same sort of thing.

19128. (Chairman.) Will it not be sufficient if you say that you have a number of other extracts that you could give us?—Yes, and I will leave them here for anyone who likes to read them. They are all the same sort of thing. Perhaps I might read one of the earlier ones, or some people might think it was a late invention. "A singular fact about the naval guns deserves mention"—it is the same gentleman, Stuart, I have been reading before—"owing to a variable quality in the cordite it has been found necessary to treat the range as a variable quantity and the charge as a fixed quantity." (Of course, the charge is always a fixed quantity in brass cylinders, and you cannot alter it.) "The Cove Redoubt gun, that is to say, in firing at Bulwana, varied in range according to

the weather by as much as 500 yards. In this country it seems that you only get its full value out of cordite in dry weather. A word of high praise is due to the naval gunners, who have been our main tower of defence during the siege. They have watched day and night, they have never shown flurry in their shooting, and they never seem to tire. There can be no doubt that we should have made a better show if we had been able to give them more opportunities, if we had had more 4·7 guns, and more ammunition." Naturally, that is true.

19129. (Sir John Hopkins.) Just one or two questions with regard to the ammunition, now that I am on the gun question. Are you satisfied with your fuses?—Yes; they did not always burst, but the great majority burst.

19130. And with regard to the ammunition, which did you find the most effective? Had you any common shell there?—Yes, we had 300 rounds for each gun—100 common, 100 lyddite, and 100 shrapnel.

19131. Which of the projectiles did you find most efficient as a rule?—It is really impossible for us to say that. Of course, the common shell makes the bigger smoke and explosion, but the probability is, from what I have read of the Boer experiences that the lyddite, even such a small charge as that, was very unpleasant, the fumes were so dreadful.

19132. And with regard to the common shell of the 12-pounders, the same applies to them, I suppose?—They had not any lyddite with the 12-pounders.

19133. Then with the field guns, I fancy they found that the lyddite was not so destructive as they expected?—No; they are so small, you know. You mean what they had at Omdurman. After all, I think the bursting charge of the 4·7 guns is only 6lbs. or 7lbs. at the outside; the explosive power is nothing to speak of.

19134. (Chairman.) Are there any remarks you wish to make about the siege?—I do not think it is necessary, but I should like to say that I had a splendid lot of officers and men under me. I had only one man reported to me for an offence in the whole four months, and he was asleep on sentry—which is rather a remarkable average, I think. I do not think anybody else equalled it, and certainly no one else surpassed it. I should rather like to say a word also in praise of the shooting of the military howitzers; at about 3,000 yards it is beautiful. Of course, when the gun they drove away was taken into position about 5,000 yards off it was beyond their effective range; although they fired at it they could not do much, but as long as it was within their range the shooting of the military howitzers was beautiful.

19135. (Sir Frederick Darley.) Up to what range was that?—Up to about 3,000 yards. I was on that place called Middle Hill, and they were on Wagon Hill. That book with the caricatures gives a picture of one of their shells bursting (showing the same). That gun was too far off; it was out of range from our naval guns; they put it there, no doubt, preparatory to the attack on Cæsar's Camp, and it was a very good thing that it was knocked out. That was very good shooting, and they always shot well. I think also I might mention the extreme use that my engineer officers were there—I do not know whether you have heard of it before—particularly one of them, Mr. Sheen. He fitted up a distilling apparatus in the town, from which thousands of gallons of fresh water were distilled every day until the coal ran short, and no doubt if it had not been for that the losses from enteric, bad as they were, would have been much greater.

19136. (Chairman.) Sir Edward Ward told us about that. You would be in favour of landing a Naval Brigade, then?—It depends on the circumstances so

much. Under circumstances like there were at Ladysmith, certainly.

19137. Do you wish to say anything about the principle on which they should be landed?—I know the Admiralty principle is a very strong one that in a place like the Mediterranean any proposal to land a Naval Brigade should be looked upon with the greatest suspicion. If there is any possibility of attack by a hostile fleet, obviously you should not weaken your ships.

19138. Is there anything else you would like to add?—I do not know whether it is out of my province, I suppose it is rather, but I should like to make one observation, and that is this. It is very often said, "Why should naval officers criticise military officers, when military officers do not criticise them?" The answer is that a great part of our training is military. All young naval officers certainly have a very thorough grounding so far as the handling of a company goes, whilst no military man has any naval training whatever. I would not make these remarks if I was going to make any unfavourable criticism, but I should like to say that after all war is chiefly a matter of common sense, and I should like to pay a tribute to Sir George White for his decision, amongst other things, not to occupy Bulwana. Anybody who looks at that plan, and knows what the Boers are, cannot have the slightest doubt that if he had occupied Bulwana, as some people say he should have done, the force holding it must inevitably have been captured. You see on that map there is a plain between Ladysmith and Bulwana, which was completely covered by the Boer guns, and the troops never could have had any reinforcements of any kind, nothing could have saved them; they would have been attacked on all sides, and must have lost the position. A great many people at the beginning thought that he ought to have held Bulwana. I must tell you, that I think he showed the greatest wisdom in not doing so; what he felt, and what I felt, and what the lot of us felt, was that it did not matter the least bit how long we were in Ladysmith as long as it was not captured; indeed, the longer we were there the better for the general plan of the campaign, because it kept a large portion of the best troops against us, and enabled Lord Roberts to organise his great advance with greater ease. With regard to one other point—perhaps it is treading on delicate ground—as to whether Sir George White ought to have kept the cavalry there or not, I would only say that the proof of the pudding is in the eating. The cavalry soldiers rendered excellent services in the lines, and we ate their horses.

19139. And the cavalry also were of use in moving about a place with so large a perimeter?—Yes; on the occasion of Wagon Hill. But it is a very impossible cavalry country—it is quite impossible. Those are the only remarks I should like to make.

19140. (Sir Frederick Darley.) Were your men seamen gunners, or were they Marine Artillery?—They were all bluejackets. There were no Marine Artillery in the "Powerful" at all, but we had 95 Marines who had been landed on the other side, on the east side.

19141. Sent to Stormberg?—Yes.

19142. But the men you had at Ladysmith were all bluejackets?—Of all sorts. Bluejackets go through a tremendous training now in gunnery. Out of that party I think I had also something like 70 stokers.

19143. Seamen gunners?—Yes, the bluejackets were nearly all seamen gunners. We had been nearly 2½ years in commission, and as Sir John Hopkins will tell you, a ship is always at her acme then.

19144. (Sir John Hopkins.) She is at her very best?—Yes.

(After a short adjournment.)

Colonel E. E. CARR, C.B., called and examined.

19145. (Chairman.) I think you were in command of the 2nd Royal Scots Fusiliers during the war?—Yes.

19146. I believe you have prepared a statement?—Yes; I have just drawn out a statement of the line that the battalion took for the three years they were out there.

I landed at Durban on the 23rd November, 1899, in command of the 2nd Royal Scots Fusiliers, arriving at Mooi River on the morning of 24th, and joined the Fusilier (6th) Brigade under Major-General Barton, C.B.

Colonel
R. E. Carr,
C.B.

On the 15th December half my battalion was engaged at the battle of Colenso, under my second in command—viz., Major Young. I was in command of Frere, with headquarters of battalion (four companies), two naval guns, and 100 mounted horse. Together with four companies of the Royal Irish Fusiliers, Major Young's half battalion, covered the 14th and 66th Field Batteries, under Colonel Long, R.H.A.

The half battalion lost 10 killed, 28 wounded, and 6 officers and 39 rank and file taken prisoners by the Boers.

On 21st January, 1900, the battalion left the brigade, and became corps troops to the army under General Sir R. Buller at Spearman's Farm.

Prior to the assault on Vaal Krantz we hauled the naval and field guns to the top of Zwaartz Kop, held the hill during the assault, and brought them down again during the night of 8th and morning of 9th February, after the retirement of the main army.

The battalion took part in the operations from 14th to 27th February, concluding with the battle of Pieter's Hill and relief of Ladysmith. In that action we formed the right flank of the attack, and lost, roughly, 100 killed and wounded, of which 13 were officers.

I went into hospital, wounded, on 28th February, till 10th April, and rejoined the battalion on the 16th April, sailing for Cape Town on the latter date as part of the 10th Division, under General Sir A. Hunter.

On 22nd April we left Cape Town, by train, for Kimberley, and encamped a few miles north of that place, viz., Dromfield.

On 4th May we crossed the Vaal River at Windsorton, south of Warrenton, detached a column from the Division for the relief of Mafeking, fought the enemy at Rooidam, and compelled his evacuation of Fourteen Streams.

On 15th May we marched, via Christiana and Vryburg, to Lichtenburg, and thence to Potchefstroom, arriving 14th June, having covered 350 miles since 4th May. During this time the battalion had marched 60 miles in three consecutive days and 43 miles in 34 consecutive hours.

The 10th Division was now broken up. Towards the end of June we garrisoned Krugersdorp with the Welsh Fusiliers, and placed it in a state of defence.

On 5th October we formed part of General Barton's column operating towards the Hekpoort Valley and Gatzrand Hills. In this trek we fought nearly every day for three weeks, during the last six days with De Wet at Frederikstad. On the 25th October we drove him off, capturing and killing about 100 of his men.

During this trek we had two officers killed and five wounded.

General Barton left us in November, 1900.

From December, 1900, to May, 1901, we were quartered at Johannesburg, and found the outposts for that town. We then left for the Krokodil Valley, holding Krokodil Poort, Nelspruit, Alkmaar, and Elandshoek, also the intervening blockhouses on the Pretoria-Komati Poort railway line.

In October, 1901, I went into hospital at Middelburg, Transvaal, for three weeks.

In November, 1901, 600 of my men were ordered to join a column under Colonel C. McKenzie, who had succeeded Colonel Benson, killed in action.

Our depôt was sent to Middelburg.

In January, 1902, the headquarters and three companies left the column and came into Middelburg, leaving a detachment to form and garrison a new cross-country line of blockhouses.

Our Volunteer company joined us in March, 1900, and left for the Orange River Colony in November, 1900.

Our casualties to 31st December, 1901, i.e., 25 months in the country, were: Killed, wounded, disease, and invalids, 665 of all ranks.

I left South Africa in August, 1902, on the expiration of my command, having been just under three years out of England.

The following are my remarks on the points raised in the memorandum which was sent to me by the Secretary to the Commission:—

Physique.

Excellent at the commencement of the war, as shown by marching and powers of endurance generally. Fair during last year, attributable to younger men arriving from home, length of war, life in blockhouses, and indifferently teeth.

The strongest men improved to near perfection with hard work.

The draft of 150 men, who arrived from India, with between seven and ten years' service, very good.

Morale.

Very good, especially considering the trying conditions of the climate, viz., sun and rain, afterwards intense cold on the march, and limited clothing. Also the hardships inseparable from all campaigns, viz., long marches, no water, and night duty for men already weary. Under fire very good.

Contented grumbling, an excellent safety-valve, indispensable to an army on service, neither out of place nor out of proportion to the occasion.

Intelligence of the Men.

Entrenchments.—Improved considerably as the campaign progressed and when in presence of the enemy with every likelihood of attack. Occasional want of intelligence when attack not imminent in the placing of entrenchments and direction of loopholes.

Intelligence was brought out soon after fighting began, and directly we had to undertake long marches, in the manner in which the men provided for their own comfort. They invariably secured and carried wood themselves, and fires were lighted and tea cooked at the shortest possible notice.

The ordinary trench taught in peace time had to be varied considerably. The ingenuity displayed by the Boers as regards shelter trenches was noticed by all ranks.

Cover.—After the first few occasions under fire the men began to take cover naturally or instinctively. Here or there some few officers and men would expose themselves unnecessarily, and it is often the duty of officers to do so. Much insistence on this subject during training is a work of supererogation. In some cases, when a rapid advance is of moment, it may be better to push on; it is often less costly than a very deliberate advance, and more conducive to success.

Under heavy fire the less said about cover the better.

Future Training.

Officers.—I think the average officer can teach as much as his men can assimilate, at any rate, in theory. In the field he can teach what he finds in books, but from the nature of his training he is rather inclined to think everything must be found in a text-book. When his work or instruction is inspected by a senior he anticipates a sort of adverse examination, and tries to think what the book says on the subject. The strict adherence to detail so necessary on parade should not obtain in the field.

An officer should not be too much supervised when instructing his men; he should be sent from regimental headquarters for at least a week at a time with his transport, tents, rations, etc., and be given a tract of country over which to manoeuvre, and with the knowledge that he may be attacked by night or by day by other companies. His work should be judged by results, and the knowledge acquired by his men tested. It is better for an officer to show originality, even though he makes mistakes, than a slavish adherence to books.

An officer is more ready to take the initiative and accept responsibility on service than in peace. He is less afraid of criticism.

Promotion examinations savour too much of cram, which is soon forgotten.

The system which obtains in a field battery is good, because each subaltern has a small command of his own, and is responsible for it.

On service each company section should be under command of a subaltern officer, because the late war has proved that greater extensions are necessary, and a subaltern cannot control a half company.

Officers must have the opportunity of moving over a country to gain tactical knowledge. The eye can only be trained to appreciate ground in this way. Rapid sketches and reports containing the most important information should be practical rather than elaborate maps, that take up much time, and are only occasionally possible on service.

When given a scheme, officers should be allowed the fullest scope in working it out, and never interfered with till completed.

An opposing force should always be provided and ambushes laid to create initiative on surprise.

Blank ammunition should be freely used.

Tactical exercises should take place continuously throughout the year.

Junior officers should be called upon to draw up schemes and criticise the results.

(At present the British subaltern rather resembles an Englishman on the Continent, who, knowing something of the language, hesitates, chary of making mistakes.)

On the subject of dash, nerve, pluck, and gallantry under fire, no one can teach the British subaltern.

Men.—No effort should be spared to make the men understand, by practical illustrations in fact, that they must exercise their own common sense in the field, and not only their own comfort, but their lives and those of their comrades may depend on this.

The role of infantry as regards attack and defence,

Colonel
E. E. Carr,
C.B.

17 Mar. 1903.

Colonel E. E. Carr, C.B.
17 Mar. 1903.

escorts, and the power of the rifle, and the important part that infantry play, if complete success is to be insured, must be attended to.

They should be encouraged also to use their powers of observation, and not depend on an order for everything.

They should be practised in wider extensions than heretofore. This was a great difficulty in South Africa. The idea of every exercise should be thoroughly explained to them before it commences. The absence of a general idea stultifies initiative. When once an attack is entered on many orders are often impossible in the field.

Mistakes should be pointed out after, not during an exercise.

Non-commissioned officers should assume the position of officers and the men that of non-commissioned officers.

They should approach, though they cannot reach the individuality shown by the Boers.

Musketry training should be altered so that marksmen and first-class shots fire only at moving objects. A new system in this direction is absolutely necessary, which would ensure infinitely more interest in musketry; in fact, instruction and recreation would be combined.

The moving objects should include artificial birds and animals in motion. In action a man's shooting often depends on his nerve.

Extensions.—Picked men, selected for intelligence and stamina, should be trained as scouts. They would be most valuable to the officer commanding battalion or company. They should be constantly practised by day and night, and have a special position in their company.

Besides firing at special visible objects, men should be taught to cover a field of fire, between certain points. The order, so often heard, "Do not fire unless you can see your object," is not always good. Had this obtained in the last war we should have used very little ammunition.

Clothing and Equipment.

Puttees.—The "puttee" is a good article of clothing, as it can easily be thrown off when men return from work or marches. Its defect at present is that it takes too long to put on or readjust when once untied.

Trousers.—The trousers should take the form of breeches, but fastening at the ankle.

Gaiters.—The men always disliked the leather gaiter.

Capes.—A general service cap must provide protection against a sun that blisters the face, and shade to enable the men to shoot.

Pouches.—The pouches used at the commencement of the war were not serviceable. Bandoliers are best, but the flaps should prevent ammunition from falling out. Some worn by the drafts from England late in the war did not fulfil this condition.

The rounds a soldier is ordered to carry should be taken in whatever receptacle is decided on. He should not be obliged to fill his pockets or haversack with ammunition.

Boots.—Boots provided in 1900 were not good. The leather and make was most inferior in this very important article of clothing.

Supply of Food.—Transport.

I think regimental transport has a number of advantages. The system means rations, etc., being at hand as soon as practicable. There is more personal interest taken to ensure keeping near the battalion. The animals are better cared for, the personnel, white or native, do their work readily, and the result is beneficial to the battalion. The system is also more elastic, as it allows of regimental arrangements in carrying the most necessary and discarding the doubtful.

Tins of rations should not weigh more than one pound. Men will not carry a tin of six pounds.

The Wallace Spade and Pick

is not desirable. The men hate carrying it, and the tools are therefore lost. It is too light for any serious work. The heavier pick and shovel must be carried for the men when useful digging is necessary.

Ammunition.

The regulations for supply in the field are practical, and work well. The supply from mules, after the primary distribution, is the best.

Mules with an enterprising transport officer and willing drivers can often approach quite near the firing line, more or less under cover.

Every preparation should be made from the base to replenish battalions at once.

There should be no hesitation when more ammunition is asked for. If not at once available from the battalion reserve, it should be supplied from any other reserve battalion.

Arms.

The rifle should be more perfectly tested as to its sighting before issue.

The slide should be so arranged that it cannot slip when once raised; this is secured in some foreign rifles.

I believe in charging the magazine with a clip. The present method is too laborious and slow.

19147. Where did your battalion come from?—From Aldershot.

19148. It was a home battalion?—Yes, we had only been at home for three years.

19149. Had you many reservists in the ranks?—When we sailed we had 456 reservists; we went out 870 strong, and of that 870, 456 were reservists and 313 men were left at home; that is 313 of the battalion were left at home, and 414 were taken out.

19150. Those left at home being young men not fit for service?—Yes, that is either under a year's service or under 19½ years of age; that was the rule then.

19151. What was your experience of the reservists?—They were very good.

19152. Was there any difficulty in getting them to work in with the rest of the battalion?—No, I do not think in the least—none at all.

19153. We are anxious to have your evidence from the regimental side of the question; what do you say as to the physique of your men?—I think that the physique was excellent; of course the rules were stricter perhaps when we started than they were afterwards, and no man unless he had a year's service or was 19½ in age was allowed to go out (it might be 19, but I think it was 19½), and as about half that we took out were reservists, and the other half were all men of a certain age, or a certain amount of service, they were excellent. The combination was as good as it could be, and we never had any difficulty, at any rate, in getting them to go on, although we suffered at first very much from the sun and the long marches after having just come off ship-board; a good many men did drop out at first, but still the best improved, and if there were any weaklings they fell out and disappeared, but there were not many—it was quite the exception.

19154. And later on you got younger men?—Yes, I think perhaps some men who would not have come under the rules for taking out at the time we left; although many were quite good men, they were not quite as good as those we started with.

19155. How did they do?—They did everything that was asked of them; but then the hard fighting and hard marching was over, and their work more consisted of work in the blockhouses. In November, 1901, 600 men went out with the battalion, forming six companies; three companies came back shortly afterwards to build blockhouses, but of the other 300 who stayed out five and a-half months, they returned exactly half their strength after the five and a-half months, that is they went out 300, and they came back 150.

19156. You mean they stayed out on trek?—Yes, they were trekking the whole time; that is, they lost 50 per cent., but those 150 that came back were ready to go anywhere, they could have done anything; I think they could have marched 20 miles a day for a week; I never saw men more fit, and that is why I said in my statement that the fittest attained near perfection—the really hard ones.

19157. And the men from India were good?—Very good; they were all over seven years' service, and I think most of them would probably average eight to 10 years' service.

19158. You mentioned indifferent teeth as one cause of difficulty?—Yes, the men did suffer very much from the teeth, and they had no chance of getting a dentist as the officers had. The officers were allowed to go into Johannesburg, where dentists sprang up and increased from time to time, but it was very difficult for men in blockhouses, with no dentist, to eat the hard biscuit,

Colonel
E. E. Carr,
C.B.
17 Mar. 1903.

because, of course, when they got into a cross-country line of blockhouses where the train did not pass they could not get bread; bread could not be made for them, and all they had was meat and biscuit, and such vegetables as they could get occasionally.

19159. (*Sir John Jackson.*) Was there any particular reason for their teeth getting bad there?—It is supposed to be a bad country for teeth, but I think there are always a certain percentage of men who have bad teeth at home, but they can go into hospital, and perhaps have their teeth attended to or extracted. Out there, however, there was no dentist at hand, and even the officers had some difficulty about it.

19160. (*Chairman.*) And the morale of your men?—The morale was excellent.

19161. All through?—Yes. I do not say that we had no courts-martial and no trouble at all, but it was very slight; it certainly was not greater than it would be at home, and I think a good deal less. I think the harder the work the men had the more cheerfully they did it.

19162. You speak of contented grumbling?—Yes, that is my opinion, of course, that it is a very excellent safety valve. I did not hear it, the Commanding Officer does not hear these things, but as the officers slept with the men, and lived with them day and night, I used to hear from them that the men used to grumble, that they used bad language which they did not look upon as bad language, and grumbled in a mild sort of way, but it never stopped them. I would like to take that instance of pulling the guns up Zwaartz Kop, prior to the assault on Vaal Krantz. It was a most terrible night, and we had to go out after dark; the horses had failed to pull the guns, and the oxen had failed; it began to rain, and it was a frightfully bad road, and very slippery indeed, and when a man tried to haul on to the gun he probably slipped down and got covered with mud, but the men were only laughing at one another, and that is what I mean by saying that the harder the work they had to do the more cheerfully they seemed to do it.

19163. As to the intelligence of the men?—I think the intelligence was very good. I should like to say that I think it is often lost sight of, that we do not recruit from the very highest standard. They are not Senior Wranglers, if I may say so, the class we recruit from, and I often hear grumbling about the men's intelligence, but I think that fact should be borne in mind. I think that considering how they are recruited their intelligence was very good, and some were, of course, excellent. They vary a good deal, and one discovers that in the home training; if you go down the ranks and ask one man a question he will answer it intelligently, and take in what you are driving at, while another will not be able to do so.

19164. It is sometimes put the other way, that looking to the class from which you recruit you cannot expect intelligence?—Well, not a superlative amount of intelligence, I think.

19165. But I rather gather from your evidence that you think you can get a sufficient amount of intelligence to make a good soldier from the recruit you now have?—Well, the difficulty is that when you once come into action there are so many other things besides intelligence that may bear on the question. A man with nerve, dash, and pluck may show to the front without requiring a tremendous lot of intelligence. He knows where he has to go, he has to assault a position, and he has not to use very much intelligence as a rule; he may have, but, as a rule, he has not, and therefore a man, although he has not shown much intelligence when you have been examining him on the barrack square, may show very well to the front in an action, and I think the majority of the men do show sufficient intelligence. I am only trying to get at the fact that I do not think it is right to expect the men to show as much intelligence as if they were more thoroughly educated than they are when they come into the ranks.

19166. But, under the modern conditions of warfare, you do require a man to exercise his own intelligence more perhaps than under former conditions?—Yes, on occasions when men become detached you do require that, because when men are put on detached posts or to act as sentries they have to exercise intelligence, and I think, considering the way the men are recruited, their intelligence is certainly up to the standard you ought to expect.

19167. The present man can be taught to take cover,

and generally to act for himself, you think?—Yes, and I have said so in my statement, but I think I would go so far as to say that the cover of which we hear so much might be cut out of the drill book altogether, because when men come under certainly a heavy fire they take cover instinctively, and if there are any stones about or anything else they will take cover. That has always been my idea, other people seem to think that men ought to be taught a great deal about cover, but my own experience is that I do not think it necessary. I do not say that individuals do not expose themselves occasionally unnecessarily, but you will never stop that.

19168. But there is an intelligent use of cover?—Yes, and I think that may not always be used when there is only an occasional bullet whistling over a man's head, but if you came to really having to cross a plain which is fire swept, as Pieters Hill was with us, men will always take cover if there is cover to be taken.

19169. And use the cover at the same time to facilitate the advance?—Yes, I think so.

19170. You think the men can be taught to do that?—Yes, I think so without any difficulty. I really do not think that cover, as far as instructions with regard to it is concerned, is a difficulty at all.

19171. You found the men did it?—Yes, they did it.

19172. I think you also hold that sometimes it is better to push on?—Yes, I distinctly think so; if you come under a heavy fire where the cover is not very great it is very often better to push on where you can get at your objective, and perhaps get at a ridge, or whatever you are trying to get at, than be continually stopping; and there is this to be said—and I say it without any adverse comment on the soldier—that if the fire is very heavy, and you once got men down, it is easier to get them down than to get them on again. Therefore, as long as you can push on without taking cover until you get to the point you want, where there may be good cover, I think it is a very good thing, and that is what I mean by saying that it is often better to push on than to advance too deliberately.

19173. And the soldier of the present day has the pluck to do that?—Yes, he has, as long as he has got his officers there. Of course I consider that the infantry officers in that way are perfect, that is in regard to leading their men on under heavy fire.

19174. I think you put it in your statement here:—"On the subject of dash, nerve, pluck, and gallantry under fire no one can teach the British subaltern"?—That is my opinion.

19175. What do you say as to the training of the officers?—I think as regards what is so much talked about as to the extra training of an officer, what the officer has a chance of doing he does very well; for instance, so far as discipline and cleanliness, exactness on parade, and the interior economy of the company go, I think the officer does well, but when you come to talk about manoeuvres and field manoeuvres, I think he possibly breaks down because he never has a chance of manoeuvring over a country, at least it is very seldom that he has, and that is why I suggest here that the only way is to get a country to go over, and to send an officer right away with his transport, and with his tents and food, the same as you would do on trek in South Africa, and then let him know he is going to be attacked, and attack him by day or by night, and see what his dispositions are. I think if an officer does not know as much as he ought to know, practically it is not his fault.

19176. You say he will make mistakes?—That is why I think he will make mistakes; he does not get that eye for country which would come from constant practice. Of course it comes quicker with some officers than others.

19177. What I meant was that you would propose that he should be allowed to make the mistakes rather than that you should interrupt his movement?—Yes, and point out the mistakes afterwards.

19178. That is not done at present?—Well, I will not say it is not done, but I do not think it is always done; I think perhaps he is stopped in the middle sometimes. There is an inclination to say at the time, "That is wrong," and, of course, if you take the case of subalterns—captains have more confidence, as they have longer service—when a subaltern is being inspected by a general officer he is not brought up as an orator, he has not much practice in lecturing, and with the inspecting officer standing by and telling him to lecture on a certain subject, he gets nervous, and I think it would be better if he was told to lecture on a thing he

Colonel E. E. Carr, C.B. liked, so as to bring out what he knows rather than what he does not know.

19179. And training of that kind would make him more ready to accept responsibility?—Yes, and nothing came out more distinctly and more satisfactorily than that before we had been certainly a couple of months in South Africa, because we were in action almost at once, and in a few weeks you could trust any subaltern in my battalion to go and throw out a line of outposts. Of course they were inspected afterwards, but they were invariably right—that is towards the Tugela River.

19180. And you instance the system in the artillery?—Yes, and I would go a little farther, if I may. I say it in the case of the subaltern, but it obtains all through the artillery; for instance, when each rank gets a step it is a step worth having, but the infantry major may be doing the same work, or almost the same work, when he has got 25 years' service as he was when he had three years' service. That is not possible in the artillery, and the artillery field officer has a very nice little command, which is a battery. The infantry major may still be commanding his company after a quarter of a century's service. I have nothing to propose as to how you could assimilate the two; I cannot think of any way, but if it could be done I say the artillery service has a tremendous advantage over our service in that way. Each step means something, and it begins with responsibility over a section, that is, two guns and the men belonging to them.

19181. You think each company section ought to be under command of an officer?—I think so, because our experience all through the war in South Africa was that it is absolutely necessary to extend on as wide a front as possible, not only on account of the casualties, but because you have so much more power if you are covering the ground; in fact, it was the Boers' game to cover an enormous amount of ground with a very few men.

19182. (*Sir John Edge.*) You said that each company section should be in command of an officer?—And sometimes it may be a sub-section; a company is divided into four sections, but if a section is very strong it is then divided again.

19183. And you would have four officers to a company?—We have only two subalterns at present.

19184. But you would propose to have four?—Yes, I would have not less than four, and in a close country, where you would not extend so much, one man very often cannot see the man on his right or left, and you can imagine how impossible it is for the section commander to control the whole of the section. As I have said in my statement, we found it a great difficulty in South Africa; the men were not accustomed to these big extensions, and it was very difficult to make them extend. Anything is good there up to 20 paces; they were extended to about three in peace training.

19185. (*Chairman.*) They must have the opportunity of moving over a country, and getting practical knowledge?—Yes, I think so. I think all they do they do well as far as they have the opportunity.

19186. As to the training of the men?—I think, my Lord, that the difficulty of field days often is that they are perhaps a great deal of instruction to the higher ranks, but as you go down the instruction becomes less and less unless the training is given to every corps and battalion; what I mean is, that if you go to manœuvres the general sees a great deal and learns a great deal, and the staff and probably the mounted officers and the commanding officers, but those on foot do not learn a great deal probably. The Intelligence officers may pick up something, but as you go down the ranks to the non-commissioned officers and men, they have only to do what they are told, and they see very little, and, therefore, the larger the scale of training the less the lower ranks gain by it. It is very hard to ask a man to exercise intelligence on a big field day on Salisbury Plain or at Aldershot, because really he only has to go straight to his front or to retire or to go to a flank.

19187. (*Sir George Taubman-Goldie.*) Would not most of the purposes of manœuvres be satisfied by very extended staff rides for all officers?—Yes, I think that for officers that would be excellent, and have all smaller manœuvres if you are to bring out the intelligence of the men; that is really what I wanted to say.

19188. (*Chairman.*) Are the men trained to exercise their common sense?—Yes, I think they are, but if they had more field training in their companies or even in

battalion, and also if what I suggested is carried out, that the company went right away, and they were attacked by night, and men were put in the place of non-commissioned officers, and put on detached posts, they would be bound to exercise their common sense, but in big combined manœuvres now they are not bound to, and they do not do it always.

19189. You want to put non-commissioned officers in the position of officers?—Yes, because it happens on service, and, therefore, I think it should be done in peace time; there are casualties among the officers, and the non-commissioned officers have to take their place, and, therefore, why not do it at manœuvres?

19190. Did that happen during the war, in your experience?—Yes, repeatedly—certainly at Pieter's Hill.

19191. How did the non-commissioned officer stand that test?—The non-commissioned officer I think did very well. Of course, the non-commissioned officer is a difficulty, at any rate, in the infantry, and I think if a larger proportion of boys of a good class and of a good family were allowed to be enlisted, with a view to their becoming non-commissioned officers, it might help that difficulty to a certain extent. I made that suggestion some years ago to the Adjutant-General, but, of course, I believe the difficulty is that a boy costs a certain amount, and he cannot take his place in the ranks as a man can; that is to say, he is an expense without being absolutely available to go on any duty. I know that I have had to refuse boys of really a good class when I knew all about their people and parents, because I could not exceed the limit, which I think was 12. I asked that it might be increased to 20, but it is not allowed. I think that the non-commissioned officer is a difficulty in the infantry.

19192. What do you mean by the boys?—We are allowed to enlist a certain number of boys as drummer-boys, tailors, and buglers, but the number is limited. I think that if a commanding officer heard of a boy, and could find out all about his family—a boy that was well brought up, and an intelligent boy, that had been well educated—and he was allowed to take him on with a view to his becoming ultimately a non-commissioned officer, it might help commanding officers in that line eventually.

19193. Do the boys you recruit as drummers now become non-commissioned officers?—Occasionally, but there is no reason why they should be particularly intelligent boys; you can get boys of that class no doubt more readily than you can get men, and that would explain what I mean perhaps. It is difficult sometimes to get a young soldier to take the first stripe, the lance stripe, as it is a very trying position for him, and, of course, they must take the lance stripe before they can go on and become corporals, sergeants, and colour-sergeants.

19194. (*Sir Frederick Darley.*) Are not the best buglers and drummer-boys drawn from the sons of men who have been in the regiment?—Yes, and they are the most contented of all soldiers; their whole idea is soldiering; they have always seen the barrack square, and they are always contented. The most contented of all soldiers are the non-commissioned officers' and soldiers' sons. I think we might get more; they are not entirely soldiers' sons.

19195. (*Chairman.*) You propose some alteration in musketry training?—Yes. What I would suggest with regard to musketry is this: a man becomes a first-class shot or a marksman, and he goes on year after year firing at a fixed target. Now he takes a certain amount of interest in it because he is a good shot, and he goes down to the ranges, but he would take infinitely more interest in it if that was varied. It is no longer necessary for him to fire at a fixed target, and as I saw at the Glasgow Exhibition, men will pay to go and shoot at mechanical contrivances which represent moving rabbits, birds, and so on; a man will pay his twopence a shot to do that, and it would be only the matter of a little money to obtain such mechanical contrivances, and if men that once were good shots at fixed targets were then allowed to fire at these sort of things, it would increase their interest enormously, because if a man will pay to do the thing, he will certainly go down with great pleasure if he can get it for nothing.

19196. (*Sir John Jackson.*) And if he has prizes offered to him, that would be a greater inducement still?—Yes; they do get a certain number of prizes as it is, but I have been for years advocating my idea about that. I have had a great deal to do with musketry, and

I am absolutely convinced that it is not necessary for a man to continue to fire at a fixed target, and that if he once becomes a marksman he would decidedly take a great interest in it if it was varied and was put more under the conditions as they are in the field.

19197. (*Chairman.*) You do not mention how you think the shooting compared with the Boers' shooting?—I have not said a word about that, because I think it is such a very difficult thing to give an opinion upon, it was so very seldom we could see the results of our shooting. We were often firing over a field of fire between two points where we could not see a Boer at all; occasionally a Boer was fired at by an officer, a non-commissioned officer, or a man, and was seen to fall, but except those we actually took killed, wounded, or prisoners, as we did at Frederikstad, when we got 100 of them, I really do not feel equal to saying what the result of our shooting was.

19198. Can you say anything of the result of their shooting?—Yes, of course, I have seen that in every sort of form. I have seen men rolled over like rabbits and slaughtered, as the Inniskilling Fusiliers were at Pieter's Hill on the first attempt, just before the relief of Ladysmith, and I have seen men advancing under ordinary cover, and I think in the ordinary course of events their shooting is good—very good.

19199. It is good all round?—They do not fire unless they are pretty certain you are there; I do not say they always see you; although the difficulty is that we cannot see them and they can see us, they can see us for miles, but we very seldom see them.

19200. Do you mean that their eyesight is better?—They can see our columns advancing; they can see us from the moment we extend, perhaps at 3,000 yards off, and they have only to wait. We come on, and we extend over a plain, we take them by surprise as much as we can, but it is absolutely impossible always to do it. The Boers are able to get out of sight of us much more than we can keep out of sight of them.

19201. Because they were mostly on the defensive?—Yes, they were acting on the defensive, and they knew the country more thoroughly, and they were not infantry, they were always riding, and they have either a natural gift, or by their ordinary training they have the power of keeping out of sight, but that they do keep out of sight is an undoubted fact, and we very often have to advance absolutely over an open plain which they can sweep from end to end with fire. It is known that our advantage over the Boer is that he can neither attack nor counter-attack; the Boer would never think of attacking as we attack in the ordinary course. I do not say that latterly, when the best were left they did not occasionally try to rush a position, but a Boer would no more attack a kopje that we were holding in force than he would fly, nor did he ever counter-attack, as he might often have done with great success.

19202. Some witnesses have said that although there were some very excellent shots among the Boers, the general result was not unfavourable to British shooting?—Do you mean that the British did not shoot well?

19203. No, that the British general result was about as good as the Boers; that would not be your opinion?—I do not say that, but I say it is very, very hard to tell what the result of our fire was, and if I gave an opinion, it would not be worth anything. I say the Boer is a good shot. I do not say he is as good as he was in the Boer war of 1881, when they could all go out with their five rounds, and bring back four springbok, but I think that he makes the most of his shooting, and I do not think he wastes his ammunition much, and I think he was infinitely better placed than we were, as he generally had a target, and we very often had none.

19204. You say that picked men should be trained as scouts?—Yes. I say that because when you come under sudden fire, the Boers are very good at ambushes and at laying traps for you, especially when the guerilla warfare began. They were constantly doing it, and often successfully, and you have not always got mounted infantry or cavalry, and I would therefore propose that the ordinary infantrymen should be trained to scout properly; the ordinary man will scout to a certain extent, but the difficulty is to get him to shove on, and extend, and send back the information that you want. You really want intelligent men for the work of scouting, so that, although the man himself might be bagged, he would prevent anything like a surprise. The scouting, of course, ought to be done by mounted troops, but in a long war like the South African war you occasionally had no mounted troops, and you were placed in all sorts

of positions. I would give the men a certain standing; I would select them, and make it a thing to be coveted. For instance, the football team in a regiment is thought a great deal of, and they have certain indulgences because they are the best men at football, and there is no reason why the same thing should not obtain in the matter of scouts or anything else that provides for the efficiency of the men.

19205. You would teach the men to use the glass or telescope?—Yes, that is where the sailors had an advantage over us. You cannot learn to use a telescope at once, and the use of the telescope was very often a matter of great importance. You could not see where the fire was coming from, as there was no smoke, and it was most difficult to locate how they were placed before us, and I think the sailor had an advantage, as he was accustomed to the telescope and we were not.

19206. As to clothing and equipment?—I have said that I believe in the puttie, and I do believe in it, for the reason that when a man comes in muddy and dirty and tired, he can throw it off at once. I think it requires a little improvement, because if the puttie once becomes undone in the line of march, it means that the man has to fall out, and if he is mounted it is more dangerous still, because it trails behind and gets entangled with the horse's legs, and it takes time to wind it up again. I think the puttie would be better without these long strings, so that the men could throw them off easily. A man always hated the leather gaiter because it kept his legs so hot, and he would never wear it if he could possibly help it.

19207. (*Sir John Edge.*) The puttee supports the muscles better, too?—Yes, and I believe it is a very good thing if you are inclined to varicose veins; something like a puttie is prescribed, in fact, for a man who has enlarged veins, and there is nothing that is a greater support. As far as the trouser goes, it is rather a business to get it over the trouser, but if the trouser was made something in the shape, although not quite, of the breeches you wear when riding, and it was made to fit more closely to the leg down to the ankle, so that a man need not fold his trouser in any way, but would just wrap the puttie round it, I think that would make it much easier, and then when he had thrown it off he would be ready to go out and do anything which was necessary.

19208. (*Chairman.*) What have you to say as to caps?—Of course, my regiment wore Glengarry caps when they were not wearing the helmet, but Glengarries are absolutely useless in the sun. The helmet is all right, but the best caps no doubt were those soft felt ones. I think the best test of a cap is what sporting men wear in tropical countries, when they want to go out shooting, and it is a felt hat—what they call a light hat in India—or a pith helmet; the lighter the better. Some of the helmets we started with were rather heavy; they were not serviceable, and the consequence was that when the men found it was not absolutely necessary to guard against sunstroke they used to throw them overboard.

19209. (*Sir John Edge.*) Is it quite easy to shoot lying down with a helmet on?—I do not think it always is, because it catches you when you put your head back.

19210. When you put your head back the helmet may come over your nose?—Yes. The soft hat was the one they liked best; it was light, and lightness is a tremendous pull to a man, and he can squash it up and lie on it.

19211. (*Sir Frederick Darley.*) Would you approve of a cap with a flap behind over the neck?—Yes, but not a cap like the Glengarry, which is all right for parade and for everything in England, and it looks right for a Scotch regiment, but it gives no shade to the eye for shooting, and is no protection to the head when the sun is at all hot, and the Natal sun was the strongest I have ever experienced. It would almost blister the backs of your hands, as well as take all the skin off your face, so that it was necessary to have something in the way of a head covering.

19212. (*Chairman.*) Of course it must depend on the climate?—Yes.

19213. (*Lord Strathcona and Mount Royal.*) Did you consider the over-sea Colonial caps good—those slouch caps?—Yes.

19214. They give good protection?—Yes, and they were easily doubled up. A man likes to put his hat under his head when he goes to sleep, in fact he does that with his helmet, with the result that it gets rather

squashed. He makes a pillow of it, as he wants all the clothes he has to put over his body; it is so cold, trekking in the cold weather; in fact sometimes the men could not sleep, and they had to get up and run about in the early morning.

19215. (*Chairman.*) The pouches were not satisfactory?—No, they were very unsatisfactory.

19216. And a good deal of ammunition was lost?—Yes, directly the men began to run. I could not state how many rounds were lost, and I reported upon that while I was in South Africa in 1900, and stated that the bandolier was better, as the weight was taken off the stomach and put on the shoulder, and the men would rather have that. It is also much easier in every way. I have also said with reference to those that came out quite late with drafts, that although they had bandoliers they were not satisfactory, because they had a long flap fastened by buttons, and the consequence was that the buttons did not hold the flap, which would lift up, and as the little receptacles got enlarged by being continually used the ammunition came out. They are all right as long as every five rounds has a little flap of its own, but the big pouches they wore, pulling on the stomach, were not good.

19217. How many rounds can a man carry in a bandolier?—I think an ordinary bandolier only takes up to fifty or sixty.

19218. Does not a man carry 150 or 200 rounds?—Yes, he does in these two pouches, but he must carry two bandoliers, and there is no reason why he should not. I think two bandoliers would be much more easily carried than those two pouches filled up, and all pulling on the stomach, which means that a man has to make his belt very tight to hold them, and also they did not carry as much as it was necessary for the men to carry, and we found them putting the ammunition into their pockets and haversacks, which I do not think was satisfactory.

19219. As to boots?—The boots were distinctly bad in 1900, and I reported upon that too. I also said if I did not actually name the firm that I could name it if necessary; they were brown paper, at least they were not very much better, they were very bad indeed.

19220. Were those boots that came from England?—Yes, they were very bad indeed, and it was very much remarked upon, because it is such a very important thing for a soldier to have good boots on, and even with the greatest care, unless you managed to get them replaced from your depôt, after a certain number of weeks some men would be almost walking on the ground with their bare feet.

19221. Were they hand-sewn boots?—I am not certain, but I could easily find that out from my Quartermaster, because he had all the details about that; in fact, he had the names of the firms that supplied them.

19222. How did they come to you?—In the ordinary way through the Army Ordnance Department; they came through the depôts.

19223. (*Sir John Jackson.*) Was it a question of one or more firms?—One firm specially was named, but I think there was more than one.

19224. (*Sir Frederick Darley.*) It was the Army pattern, I suppose?—Well, they were in the form of the Army pattern, but they were not the boots we were supplied with at home.

19225. Not up to specification?—Not up to what we used to get at home; it looked as if the contractor had not been behaving quite fairly, and we were suffering for it.

19226. (*Chairman.*) Was that only one consignment?—No, it was more than one to the best of my recollection. I know I wrote that report about August or September, 1900, when we were at Krugersdorp.

19227. (*Sir John Edge.*) It was reported home?—Yes, I answered that in connection with a lot of other questions about the interior economy of the regiment.

19228. (*Chairman.*) You reported to whom?—It went in officially through the General. I do not know to whom it went eventually.

19229. You do not know whether it came home or not?—Well, I take it for granted that it did, because all these questions were on a printed form.

19230. Sent out from home?—Yes, sent out from home. I answered them opposite the questions,

and boots was one of the items. If they were not I put them in myself; but I think they were one of the headings.

19231. Was there any other matter you had to find fault with besides boots?—Well, I have mentioned the sighting of the rifles under the heading of arms; the ammunition pouches were not satisfactory, and the boots that came out were not satisfactory. The boots we started with were very good.

19232. (*Lord Strathcona and Mount Royal.*) Had you any opportunity of seeing the over-sea Colonials' boots?—No, I cannot say that I ever did; although I was with the Colonials occasionally, I was not mixed up with them to the extent of noticing any details of their dress.

19233. Do you consider that the ordinary half boot is better than the long boot with soft leather for the legs?—Yes, I think that the short boot is better.

19234. Even when the leather of the leg is soft you think the short boot is better?—I think the short boot is better.

19235. Because some of the Canadians' boots were of that longer kind, and were said to be most serviceable and to wear well, the quality being good?—Yes, and, of course, I had not a chance of seeing those boots that you are referring to. I might have said that they were better if I had seen them, but I have never seen that particular pattern, and I was not sufficiently mixed up with the Colonials to see those little details of their equipment.

19236. I heard that they were preferred by the mounted infantry very much?—Of course, it was absolutely necessary in some parts of the campaign to have something that would protect you against spear grass; the spear grass is a thing which is maddening if you have not a protection, and, of course, a puttee was a sufficient protection for that. If you had not been wearing the puttee it would have been necessary to have something up your leg to protect you against spear grass, because it irritates you to the point of distraction.

19237. How long would a pair of those inferior boots you have referred to last?—I do not believe that in hard work, with the rough ground that we very often had, they would last a fortnight. I am not speaking exactly by the book, but from what my Quartermaster told me of the boots that were returned by the men as not serviceable, and they had them a very short time indeed.

19238. I have seen some of the Colonial boots that had been in use for six months altogether on the march in hard work, and they were still good?—Had they been marching or riding?

19239. Well, they were mounted infantry, but they had a good deal of marching?—Of course you see the ordinary regular infantry man is entirely on his feet, and his boots never get a chance.

19240. (*Chairman.*) As to supplies, you would prefer regimental transport?—Yes, that is my experience; we had it in Natal all the time, and it worked excellently. We had a very enterprising young officer, and whenever we wanted anything, as long as we could get the helio on to him we knew we should have anything he could bring us, whether it was ammunition, food, clothing, or anything else. That is why I believe in the regimental supply, because you can regulate what shall be carried and what shall not be carried. For instance, on one occasion we were allowed so much; we had one wagon per company, which carried a certain quantity, and I think one more wagon, and the General said, "The officers are allowed 35lbs., but I think they could do with much less, say 15lbs. or 20lbs., and then we could carry the men's great coats. As long as the transport is regimental you can regulate things in that way as much as you like by leaving behind what you like and taking on what you think more important."

19241. Was the officer in charge one of the ordinary regimental officers?—Yes, he was one of my subalterns.

19242. Did you ever have a call upon your transport to form part of the general transport? Was it taken away from you?—No, not in Natal, and I do not think it was ever taken away from us afterwards; I cannot recollect that it was ever done. I know that in Lord Roberts's Army the other system was in force, which was not regimental, and there may be advantages in it that I know nothing of, but I know the advantages of the regimental

system, and I know that on one occasion, when under a very hot fire, a message was sent back that we wanted more ammunition. The officer I have referred to was a long way off. The man had a very difficult way to go, and he had not any ammunition, but he took some mules from the nearest battalion to him, in fact he stole them, and he brought those mules up and replenished our ammunition pouches under the most difficult conditions. It was down a river bed covered with boulders, and up a tremendous slope at an angle of about 45 degrees, and if we had not had the regimental system then I do not think we should have got the ammunition as quickly.

19243. We can see the advantage of that, but supposing it might be necessary to use the regimental transport for the general work, what would happen to the officer in control of the transport? Would he leave you and go with the transport, or would you keep him back?—Well, it would probably be in brigade; it would be under the orders of the brigadier, although it would be regimental, and he would say where the transport was to move, and the officer would move either behind his battalion, or, if you were just coming into action, perhaps the whole of the brigade baggage or transport would be massed together and be right in the rear. It would depend a good deal on the kind of march you anticipated.

19244. That is when it still remained regimental, but supposing it became non-regimental for a time, as circumstances must arise under which it becomes non-regimental, would your regimental officer then leave his transport?—He would still be employed with the transport, but he would be under somebody else's orders other than the regiment; that is what I think it would mean.

19245. Has the officer in charge of the regimental transport no ordinary duties in the regiment?—Yes, he is exactly the same as any other subaltern; in fact, what he has to learn is his duty as transport officer. He knows the other duties, and with the experience of working we had, and the amount of transport that came into requisition in South Africa, an intelligent officer picked it up very quickly—the ways of the mules and the ways of the natives.

19246. Did you find you were often given tinned meat in tins of 6lbs. weight?—I have said 6lbs., and I think I am right, but I am not absolutely certain; certainly they were so large that the men would not carry them—they may have been 4lbs.

19247. Was that in Natal?—Yes. I do not say that afterwards, when they got more knowing and knew what it was to be hungry at the end of a long march, they would not have carried them, but they had not felt the pinch of hunger at that time—we had always been very well fed up to the relief of Ladysmith—and they threw them away. Of course, they suffered for it afterwards. A man is only asked to carry it for a short time, and then it would go to the next man of a section.

19248. Some witnesses have said that the tinned meat made the men extremely thirsty?—Yes, it is rather salt, and sometimes it seemed saltier than at others.

19249. (Lord Strathecona and Mount Royal.) I think it has been said that the larger-sized tins—6lbs. or 7lbs.—were issued only when the smaller ones could not be procured; the supply failed altogether, and they were not to be got from any of the factories?—I see. I know we had them of that size early in the war, before the relief of Ladysmith.

19250. (Chairman.) Speaking generally, were your men well supplied with food?—Yes, they were really never starved; they may have been hard up for water. Once, after a 26 miles march, there was no water of any kind anywhere, and of course that must happen, but they were well fed, I think, on the whole. I think everybody agreed that the commissariat arrangements were very good. Of course, occasionally we would get indifferent potatoes and no vegetables.

19251. (Lord Strathecona and Mount Royal.) Were your men always furnished with filters for the water?—No, they did not always get them, but we were very careful indeed about the water; every drop of water that was drunk, and even the water that the officers used for their teeth, was boiled.

19252. But on many occasions that must have been impossible?—It was impossible on the line of march, but whenever we were permanent for any time we always established a big boiler for the purpose of boiling water.

19253. There was no regular supply, then, of filters for the men?—No; it happened from time to time, and it

happened in regiments; regiments sometimes provided them, and sometimes they may have been provided by headquarters, but we never had a regular supply of filters. I will not say they were never supplied during the war at all by Government, but it was not regular throughout the Army; we did not have them.

19254. (Chairman.) The Wallace spade you do not approve of?—Well, my experience of the Wallace spade is that the only thing it was used for was to knock tent pegs in, and to dig trenches round when it was going to rain; there was nothing serious about it, because I do not think it would have been any use on the really hard, rocky, stony ground we had out there. The spade was too light, and another thing was that the men were expected to carry it, and they disliked that very much. A man would always take the opportunity of losing his spade if he could. He was found out and punished, but that did not produce the spade, and when you wanted it it was not there.

19255. We have had a good deal of evidence to that effect, and that the proper way to do would be to have really efficient picks and spades carried in a cart close up to the line. That would be your opinion?—Yes, I agree with that.

19256. Were the ammunition supplies satisfactory?—Yes, I think they were very good indeed. I do not say we never ran short of ammunition, but that is a thing that sometimes you cannot guard against. I think the ammunition supply was very good, and that supplied by mules I think was very good too. Especially if the country is at all undulating and you have a good officer with willing drivers he will manage to get pretty close and he will shove the ammunition on in one way or another. Take, for instance, the case I mentioned, where the ammunition was stolen from another regiment; it was a very heavy fire under which the officer got it up, but he did get it up, which shows that it can be done.

19257. As to the rifle?—I have always thought that the slide should not be able to move. At Hythe there is a specimen of every rifle used by any great nation, and many of them have the slide so that you shove it up with your thumb and then it is fixed. Our slide can slip, it can get loose, and instead of being at 600 yards it may be at 400 or 500—it may slip from the very top to the bottom. I think that some of the foreign rifles are better than ours in that way with regard to the slide. A man does not notice that it has fallen down, and he is using the wrong sight. The sighting is not always as perfect as it ought to be when the rifles are issued from Woolwich, or wherever they come from. I had an opportunity of testing rifles with a view to reporting upon them when they had come straight from Woolwich Arsenal, and the sighting has not been right. I remember that with reference to carbines at York once, and I had to report that although they had come straight out of the factory the sighting was all wrong.

19258. Was that a common thing during the war?—I do not say that it is common so as to make a great deal of difference, because perhaps 50 or 100 yards might not matter in a big war and in the ordinary course of events when we are firing at long ranges, but it was very common to find that the rifle was not properly sighted for shooting on a range to win prizes where you want extreme accuracy.

19259. (Lord Strathecona and Mount Royal.) Do you consider that the rifle would be better for service if it had a long wooden stock down almost to the muzzle?—No, I do not think that would make any difference; I think perhaps it might be a little longer than at present, but a man does not want to get his left hand so very far forward. Perhaps it would be an advantage to lengthen it a little, but I do not think you want it right down the barrel.

19260. Still, he would get a better grasp of it if the wood were sufficiently long for him, and especially when the barrel was heated?—When it is heated you cannot touch it without the stock.

19261. (Chairman.) Is there anything else you would like to add?—I have said in my statement that I believe in charging the magazine with a clip; other officers may say "No," but it is done by most of the foreign armies, and it is done by the Boers, and there is no doubt that it is a very laborious thing putting each round in separately.

19262. A good many officers have recommended that to us?—Are the majority in favour of the clip?

19263. (Sir Frederick Darley.) Some were against it;

Colonel

—

some say they would have the magazine as it is now full, and then you could load cartridge by cartridge if you were not firing in volleys, and you would have your magazine always ready?—Yes, but constantly when the men were told to charge their magazines at the beginning of the war it happened that two or three men let off their rifles while they were charging them, and there was a tremendous explosion; in fact, we had to say that any man who did it in future would be punished, because whenever you gave the order "Charge magazines," one or two men would let their rifles off, and there would be a tremendous explosion, and the bullets went anywhere. I do not think that would happen with the clip, and I think it would be done more quickly. I must say I believe in the clip.

I think there is one thing I should like to mention, if I may. I think it is a great mistake young officers being allowed to be detached from their battalions until they have a certain amount of service. I speak entirely by experience now. An officer may become detached; he may be put on the staff, and he may be eminently an officer that has everything to learn, both as a man of the world and as an officer; he may then for some reason or other not be available until the time comes for him to be promoted to a company; all his confidential reports have probably been favourable, they have not been supplied by the Commanding Officer but by the General Officer on whose staff he has been, and I think in that way an officer may be promoted to the command of a company who has hardly been through any experience as a subaltern, and I do not think the system a good one.

19264. (Chairman.) You are speaking more of the personal staff?—Yes; A.D.C. very often, or in other ways. I speak to you from what I have actually seen, and I am sure it is not good. Some officers, of course, pick up things very quickly, but others do not, and you will often get a case of officers who have no experience in regimental life, and no experience as soldiers, no responsibility, not having been corrected, and not having got their wits about them as they have to do in a battalion, and they suddenly become Captains, and although their reports may be good, their experience has not been such as would tend to make them fit for the command of a company at all.

19265. It affects the regiment?—Yes. I have been reading what other people have said, and I have noticed remarks about the infantry, and I should like to say this, if I may be allowed, although it is not quite within my province, that I am absolutely certain that it would be very deplorable if the idea got about that mounted troops—cavalry certainly—could ever take the place of infantry. Ladysmith would never have been relieved if we had gone on those lines, because it was entirely relieved by infantry and guns, and nobody else could have relieved it. I see that there is an idea that everything must be mounted troops in future because we were fighting under peculiar circumstances and required mounted men in the South African war, but anybody who had seen what I have seen, and what everybody else saw in Natal, would never for a moment suggest that infantry do not complete any big fight. I mean to say that a great deal was done by big bodies of mounted men in the advance through the Orange Free State, but if we were fighting against a different kind of enemy he might have just as many cavalry as we had, and he would prevent those turning movements threatening his lines of communication. That is, of course, where we scored over the Boer, as he could not bear to have his lines of communication even threatened; but supposing the enemy were as strong in cavalry as we were, that would never obtain, because our cavalry would never be able to outflank him.

19266. (Viscount Esher.) Do you approve of a proportion of your infantry regiments being trained as mounted infantry?—Yes, I do think it is an enormous advantage even if you only have a few, because it helps scouting so much, supposing you are cut off from other mounted troops. Mine was one of the few battalions in South Africa that for a long time retained its own mounted infantry. I only had 40, but they were of enormous advantage to get over the ground quickly, and also for scouting, which I think so much of that I suggested men should be trained even on foot especially as scouts; but if you have mounted men it makes you independent.

19267. Therefore you would be glad to see the whole of your battalion passed through gradually a course of mounted infantry training?—Yes. I do not think you

could make a mounted infantryman in three months, as we often try to do, although he might be able to sit on a horse. Take an officer; he cannot learn to ride in three months, although he probably begins when he is six years old; and I think we expect the men to do too much, and when you come to service there is this disadvantage, that even if he is a horseman he is not a horsemaster, and many horses died out there not from hard work but from want of care. I suppose that is not questioned.

19268. That is so, of course; at the same time, even if he only gets the three months' training, it is better than nothing at all?—Yes. I only say that the training should be longer, if possible, to turn him out as a really good mounted infantryman.

19269. Which would you prefer, to pass only a limited number through the longer course, or to pass the whole battalion gradually through the shorter course?—The limited number. I would rather have one company trained for a longer period than have the whole regiment just taught a little.

19270. (Sir Frederick Darley.) You would sooner have one company perfect than the whole regiment with a smattering?—Yes, that is what I was trying to convey.

19271. Has a Lieutenant in the regiment a distinct section to command?—He has a half company.

19272. Does he always command the same half company?—Yes.

19273. That is his command?—Yes.

19274. What does a Sub-Lieutenant have?—The same; there is no distinction except that, of course, in the absence of Captains, a Captain being on leave, the Senior Lieutenant would command the entire company. I do not mean to insinuate that a subaltern officer always has the same half company for a great many years, because something might happen whereby it might be necessary to move him to another company, but as long as he remains in one company he has the half company, and he is supposed to know everything about the men of that half company.

19275. He is in touch with the men of that half company?—Yes.

19276. (Viscount Esher.) But in point of fact they are shifted about a good deal?—Yes, that must happen, and the same thing applies to the men on home service, because you are always sending out drafts to India.

19277. (Sir Frederick Darley.) How many companies were there in your regiment in South Africa?—Eight of my own companies, and we had a Volunteer company for a certain time, which made nine.

19278. Your Captains were the paymasters of the companies?—No, not exactly that; the Adjutant is nominally the paymaster, but all he did was to submit an estimate of the money he wanted to Pretoria, Durban, Maritzburg, or wherever it may be. He gets a list from the Captains of the money they want, and then he puts it together, and the money is sent down from wherever the money comes from, from the town, in cheques to the officers commanding the different companies.

19279. It is sent to the officer?—Yes, in the name of the officers, a separate cheque for each one.

19280. So that there are nine officers?—Yes.

19281. And the colour-sergeant of that company is also assisting the officer in paying the men?—He is the pay-sergeant invariably with us.

19282. So that is nine more?—Yes, but eight is the ordinary number.

19283. Then we will take it as eight; that is eight more, which makes sixteen officers?—Sixteen officers and non-commissioned officers.

19284. But sixteen individuals are engaged in the pay of the men?—Yes.

19285. But those officers, the Captain and the colour-sergeant, are supposed to be charged with the drill of the men also?—Yes, under the present system.

19286. And most of their time is taken up with the keeping of accounts and this pay matter?—The company accounts are not easy things to keep; quite the reverse.

19286*. It may interfere with their time on parade, keeping of accounts and this pay matter?—You see that in a regiment you have about five men, or possibly six, that have the aptitude for drill, and the rule always

was that the recruits should be drilled by those men. The Guards have able drill sergeants; we have nothing, and therefore we make the best we can of them. Then that rule was brought out of training by companies, and we had to make men learn the drill out of a book, and hear them like schoolboys, but they could not teach men drill, as they had not the aptitude for it. It was a system which did not work well with us, and then the war broke out, and we had no more of it.

19287. The colour-sergeant is supposed to drill the men?—And he may not have the aptitude for teaching. You might have a very good man as a lance-corporal, and you could make him teach drill, because he has the aptitude.

19288. Do you not think it would be better, instead of eight companies having sixteen men employed in this way, that your officers should train the troops, and that you should have one paymaster, with perhaps a clerk, to do the other work?—Yes, I think every regimental officer thinks that; it would free one's hands tremendously, of course.

19289. It means that you would release the sixteen—the eight officers and eight principal non-commissioned officers—for their proper functions?—Yes, but they are supposed to comply with all their other functions as well. I do not think the heads of the department would acknowledge that it should interfere with them, and even if company accounts were easily done, it would not matter; but they are not at all easy—they are very complicated.

19290. An officer may be surcharged for paying men something more than he ought to pay them, and he has to make it up out of his own money?—A man would probably be debited with the amount, and if the man was absolutely discharged he might lose it; but I do not think the officers generally lose in that way, because the colour sergeant is very careful not to let his company officer in if he can help it. Of course, a man sometimes bolts with £20, as once happened to me, and that is, of course, a loss.

19291. This possible loss might make a man anxious about his position?—Yes, I perfectly agree, because the orders are very stringent now that the officer is never to entrust his pay-sergeant with any coin, and that involves the officer taking the money away, if there is any money over from paying the company, to his room, and

he locks it up, and it may be all right, but, on the other hand, it may be all wrong because it may be stolen.

19292. It is your opinion, obtained from your past experience, that it would be better to have a paymaster, and, if necessary, a paymaster's clerk, in each regiment to keep the accounts and pay the men, than to have the present system?—Yes.

19293. (Sir George Taubman-Goldie.) I just want to make sure about your strength when you went out; you left 313 at home and took 414 out?—No, our total strength going out was 870; of those 456 were Reservists and 414 were men that were serving, and not Reservists; that is, 414 and 313 would be what our strength was without the Reservists.

19294. 727 without the Reservists?—Yes; and of those we took the 414 and left the 313.

19295 (Lord Strathcona and Mount Royal.) You are strongly of opinion that there should be special bodies of mounted infantry trained as scouts, men selected as being especially well fitted for that purpose?—Yes, that is my opinion; and even if they cannot be mounted infantry, I would have them without being mounted; if they could be mounted so much the better.

19296. Had you any such during the war?—We had our own mounted infantry, but that is all; we had no specially-trained scouts. Of course, the idea was that at certain times you sent forward scouts, and that every man knew how to scout, because he was taught in his annual training, but I would go deeper than that; some men would never make good scouts and others would, and I would pick out those that were intelligent and had good wind and dash and pluck and observation, and I would make them special men in every company, so that the Commanding Officer or company officer could call for the scouts of a company.

19297. You would have them specially trained for that purpose during the time of peace?—Yes, but regimentally. I would not send them away to train, and the officers could train them all right. I would like, if I may, to lay great stress with regard to the officer's training upon this point—that if he is to be trained he must have a tract of country and be sent away absolutely as he would on service, carrying everything with him.

19298 (Chairman.) Is there anything else you wish to say?—No.

Colonel
E. E. Carr,
C.B.

17 Mar. 1903.

FORTY-EIGHTH DAY.

Wednesday, 18th March 1903.

PRESENT :

The Right Hon. the Earl of ELGIN and KINCARDINE, K.G., G.C.S.I., G.C.I.E. (Chairman).

The Right Hon. The Viscount ESHER, K.C.B., K.C.V.O.

The Right Hon. The Lord STRATHCONA and MOUNT-ROYAL, G.C.M.G.

The Right Hon. Sir GEORGE DASHWOOD TAUBMAN-GOLDIE, K.C.M.G.

The Hon. Sir FREDERICK MATTHEW DARLEY, G.C.M.G.

Admiral Sir JOHN OMMANNEY HOPKINS, G.C.B.

Sir JOHN EDGE.

BERNARD H. HOLLAND, Esq., Secretary.

Colonel D. HAIG, C.B., A.D.C., Commanding 17th Lancers, called and examined.

19299. (Chairman.) You have been good enough to send us a *précis* of the evidence you are prepared to give, and if you have no objection I think we had better begin by placing that on the notes, and we can develop any point as we go along?—Certainly.

1. POSTS HELD IN SOUTH AFRICA.

1899. I left England in September 1899 with General French as Deputy Assistant Adjutant General for Cavalry in Natal and acted as his Chief Staff Officer there during October at the battle of Elands-laagte and engagements round Ladysmith.

On November 2nd I proceeded to Cape Colony as Deputy Assistant Adjutant General of the Cavalry Division which was then being mobilised in England.

On November 18th I accompanied General French to Naauwpoort, Cape Colony, and acted as his Chief Staff Officer during the operations in the Colesberg district.

1900. Appointed Assistant Adjutant General of the Cavalry Division with local rank of Lieut.-colonel during the march from Modder River to Paardeburg and accompanied General French as Chief Staff Officer until December 31st, 1900.

1901. On latter date we proceeded to Naauwpoort, Cape Colony, and took over command, with local rank of colonel of four columns—viz. those under Lieut.-Colonel Byng (South African Light Horse), Grenfell (2nd Brabant's), Williams (Mounted Infantry), Lowe (7th Dragoon Guards), and operated in the central districts against Kritzinger. I was at this time directly under Lord Kitchener's orders.

March 3rd, 1901, followed De Wet across Orange River into Orange River Colony, under orders of General Lyttelton, to Thabanchu.

April 7th, ordered to Cape Colony and took over com-

Colonel
D. Haig,
C.B., A.D.C.

18 Mar. 1903.

Colonel
D. Haig,
C.B., A.D.C.
18 Mar. 1903.

mand of the following columns from Major-General Settle—viz., those under :

Lieut.-Colonel the Hon. A. Henniker, Imperial Yeomanry and Victorian Contingent.
Lieut.-Colonel Crewe, Kaffrarian Rifles and Eastern Province Light Horse.
Lieut.-Colonel Gorringe, District Mounted Troops.
Lieut.-Colonel Scobell, Brabant's Horse and Imperial Yeomanry.

From this date until the end of the war I commanded a group of columns in Cape Colony, and also the western half of the Lambert's Bay, Calvina-Carnarvon block-house line.

1901-2. The following column leaders were under me from time to time, in addition to those already named :

Lieut.-Colonel Lukin, Cape Mounted Rifles.
Lieutenant-Colonel Crabbe, Imperial Yeomanry, D.E.O.V.R., P.A.G.

Lieut.-Colonel Watchorn, Tasmanians.
Lieut.-Colonel Macandrew, Midland Mounted Rifles.

Lieut.-Colonel Monro, Bethune's Mounted Infantry. 9th and 17th Lancers.

Warren's Mounted Infantry.
Lieut.-Colonel Neylan, Cape Police.
Lieut.-Colonel Kavanagh, P.W.L.H. Squadron, 5th Lancers.

Lieut.-Colonel B. Doran, Imperial Yeomanry, 5th Lancers.

Lieut.-Colonel W. Doran, Imperial Yeomanry.
Lieut.-Colonel Callwell, 5th Lancers, Imperial Yeomanry.

Lieut.-Colonel Lund, one Squadron 9th Lancers, Brabant's; one Squadron 17th Lancers.

Lieut.-Colonel Cappe, two Squadrons 12th Lancers, Colonial Light Horse.

Major Wormald, two Squadrons 12th Lancers.

Lieut.-Colonel Wyndham, 16th Lancers.

Lieut.-Colonel Kavanagh, 10th Hussars.

Major Rankin, W.P.M.R.

On conclusion of the war I commanded the western half of the Colony, and, in addition to regular infantry, militia, and artillery, I had the following Yeomanry under me :—

27th Imperial Yeomanry, Lieut.-Colonel Wight Boycott.

28th Imperial Yeomanry, Lieut.-Colonel Turner.

29th Imperial Yeomanry, Lord Longford.

31st Imperial Yeomanry, Viscount Fincastle.

32nd Imperial Yeomanry, Lieut.-Colonel Kemp.

30th Imperial Yeomanry, Lieut.-Colonel Birch.

I returned from South Africa on October 21st, 1902.

II. Efficiency of the Organisation of the Army as

II.—EFFICIENCY OF THE ORGANISATION AS TESTED IN THE WAR.

- (a) Staff.
- (b) Cavalry Division, Brigades and Regiments.
- (c) Mounted Infantry.
- (d) Colonials.
- (e) Transport.
- (f) Ordnance.
- (g) Supply.
- (h) Remount Departments.
- (i) Medical Arrangements.
- (k) Engineer Services.

(a) Staff.

1. Staffs were hurriedly formed after the outbreak of war. Officers were new, therefore, to their duties, and unacquainted with one another. The machine did not consequently work as smoothly as it might have done had all its parts been fitted together and tried during peace.

2. As a rule, a General was not allowed to select his own staff, but had to take whoever was posted to his staff by headquarters.

3. Some officers holding staff appointments lacked the requisite training.

4. Many officers were taken from regiments in the field for staff appointments and duties on the communications, thereby reducing the number of regimental officers at a time when there was much work for everyone. In the same manner non-commissioned officers and men were taken from cavalry regiments for clerks, orderlies, servants, etc., for divisional and brigade staffs. In fact, summing up, no organised, well-trained and complete staff took the field with any brigade or division.

(b) Cavalry Division, Brigades, Regiments.

1. The cavalry at Ladysmith was only organised when the Boers were practically at the gates on 31st October. (See Field Force Order of that date.)

The regiments of the Cavalry Division from England were hurriedly formed into brigades two days before leaving Modder River for Kimberley. Indeed, some brigades were not completed until after De Kiel's Drift (on the Modder River) had been reached.

So the division was really a collection of units and lacked that cohesion which is essential to success against any organised military force. That is a grave error.

2. No adequate provision was made for keeping corps at the front up to efficient strength; and at times, although regiments were able to mount all their officers, only a small number of men could take the field owing to want of horses.

During the advance to Bloemfontein corps like Kitchener's and Robert's Horse were formed and sent to the front. Had the horses used by these corps been available for the Cavalry Division, instead of being used by regiments which, owing to lack of training, were at that time of very little use, the efficiency of the Cavalry Division would have been more than doubled.

Throughout 1900 cavalry regiments generally had 700 to 800 men in the country, but very seldom had more than 300 to 400 men present at headquarters, because there were no horses for them. All this time fresh mounted corps were being raised composed of untrained men. The false economy of this method is obvious.

3. Regiments at the front had their numbers reduced, owing to officers being required for the staff, dépôt, or duty on the communications.

Farriers were also taken for extra regimental duty; men were taken for orderlies or servants to attached officers, such as medical, veterinary, and other officers.

Regimental signallers were taken and formed into a corps of signallers. I am of opinion that the latter corps should have been formed before the war broke out, and that in future a permanent corps of signallers and orderlies be kept up in peace.

The following points seem also of the greatest importance to ensure that a mounted force in the field is kept up to strength :—

First.—Regiments should consist of five squadrons in time of peace, so that on mobilisation four effective squadrons can at once be formed, and the remainder with the cadres of the 5th squadron are available then to form the reserve squadron.

Second.—When a brigade mobilises these reserve squadrons of regiments should be organised without delay into a dépôt, and sent over-sea for the purpose of preparing drafts for their corps at the front.

Third.—When a corps at the front becomes reduced in numbers, on the first opportunity certain squadrons should be made up as near to war strength as possible, by transferring horses and men from the other squadron or squadrons of the regiment. The cadres of the squadron thus depleted should then be moved to the rear to the dépôt, and reorganise.

4. The general physique and intelligence of the Cavalry Division was good, but many of the Dragoon and Lancer reservists were, however, far too big and heavy.

Our system, which sends reservists of one regiment to other regiments on mobilisation, is most pernicious. In the cavalry small parties are often isolated and in difficult situations. It is most essential that all the men must have been brought up in the same regiment, and be animated by the same traditions and *esprit de corps*.

The present system of enlistment by corps sends a man to serve in two or three different regiments, and possibly to a fourth regiment as a reservist. In peace time men should as far as possible be kept together in the same groups, and should certainly at all times belong to the same regiment.

(c) Mounted Infantry.

The mounted infantry was hastily organised. At the commencement of the war (December, 1899), excepting a few companies furnished by regiments stationed in South Africa, the men could scarcely retain their seats at a trot over rough ground, and were entirely ignorant of the first principles of the care of horses. After three months or so they improved in riding, but few ever became good enough riders to be fit for scouting work.

(d) *Colonials.*

The over-sea Colonials were good horsemen, but bad horsemasters. Colonials chiefly lacked trained officers. There were not sufficient Imperial officers to meet the demands of the Colonial corps.

(e) *Transport.*

The cavalry and artillery were handicapped by unfit and underfed horses carrying excessive weights of saddlery and equipment.

The question of providing light regimental transport to carry the daily requirements of men and horses is most urgent. The recent war proves clearly that, with the extended operations and increased mobility now necessary, it is impossible for the fighting men of any branch of the Service to be loaded up with the paraphernalia necessary for their warmth and sustenance at night. Articles such as picket pegs, blankets, mess tins, cooking utensils, forage and rations must in future be carried by some light transport.

In Appendix A (see page 405) are given certain proposals for reducing the weight to be carried by cavalry in the field.

(f) *Ordnance.*

Some of the equipment was unsuitable to the country and the work required of the troops. The cavalry was overloaded; the total weight carried by a troop horse in marching order exceeded 20 stone. This was composed partly of articles unsuitable and not required by individuals for warfare, and partly of food and articles that ought to be carried in the light regimental transport.

(g) *Supply.*

The supply services seemed well organised. Men, as a rule, had ample rations, but there was seldom a sufficiency of forage. In South Africa full rations were generally 10lbs. oats. Hay was never procurable excepting in standing camp on the railway. At Paardeberg the grain ration was reduced to 4lbs. per day. From February 10th to March 7th, 1900, horses were on reduced rations when even the full ration was insufficient. The grazing was then indifferent, and quite inadequate for the large numbers of horses then concentrated.

(h) *Remount Department.*

It is difficult to pass judgment on the Remount Department. There is no doubt that it was not organised for the supply of as many horses as were required by the late war, and the Army suffered in consequence. Our experience was briefly as follows:—

The trained English horses of the Cavalry Division were reduced by one-third when the division reached Paardeberg, and by two-thirds when it reached Bloemfontein. At Bloemfontein the remounts issued were good English horses, mostly registered horses, with many of the hunter type. Unfortunately it was necessary for brigades to march fresh from rail and ship, and only a few extraordinarily constitutioned horses survived this treatment. At this time the cavalry suffered greatly from lack of farriers, regiments having to send some of their farriers to the Remount Department and veterinary hospitals, where staff farriers were deficient. Also the mounted infantry were provided with some farriers from the cavalry. Many horses had been left unshod from the day they were embarked, and time and men were lacking to shoe all the remounts before marching. At Kroonstad more remounts were received, but of inferior quality to those issued at Bloemfontein. The cavalry division was again remounted at Pretoria, but the remounts had further deteriorated in quality, consisting largely of Hungarians of the harness or hackney type.

(i) *Medical Arrangements.*

The medical services were always sufficient, but some of the Colonial ambulance corps seemed to be equipped more suitably for operating with mounted troops than those sent from England.

(k) *Engineer Services.*

In earlier stages of the war mounted engineers to accompany cavalry regiments and brigades were not always sufficient.

In a country like Europe, where river beds containing water have to be crossed, the want of mounted engineers will be more urgently required with brigades than was the case in South Africa.

III.—USE OF THE DIFFERENT ARMS UNDER MODERN CONDITIONS.

(a) *Cavalry and Mounted Infantry.*

72C

(b) *Artillery.*(c) *Infantry.*

(Instances from the war will be quoted if required to bear out opinions herein expressed.)

(a) *Cavalry and Mounted Infantry.*

Cavalry will have a larger sphere of action in future wars; in fact, as now armed, it is a new element in tactics.

Besides being used before, during, and after a battle, as hitherto, we must expect to see it employed strategically on a much larger scale than formerly, when it was without an effective firearm.

The rôle of mounted infantry, on the other hand, is essentially a tactical one, although if combined with cavalry it may assist in the large strategical movements of the latter.

The rôle of the two arms must be kept distinct; the cavalry must not be permitted, while increasing its efficiency with the carbine, to become mounted rifles, nor must the mounted infantry be allowed to emulate the cavalry and depart from its distinctive rôle of mobile infantry.

At the same time there seems a danger of confusing their respective rôles if mounted infantry and cavalry are put together. Besides, it is a question whether any country can afford to keep up and train mounted corps of different values.

Apart from the value of mounted infantry as a support to cavalry, or as escort to artillery, its main sphere of utility will be its actual tactical mobility, which will enable the General to change the tide of battle in the greatly extended battlefields of the present day.

The possession of a rapid and accurate shooting weapon has rendered cavalry more independent, but it must not be allowed to acquire the habit of employing dismounted tactics in season and out of season. Indeed, I think the withdrawing of the lances and swords from our cavalry in South Africa was a serious mistake. The ideal cavalry is that which can fight on foot and attack on horseback, and I am thoroughly satisfied from what I have seen in South Africa that the necessity of training cavalry to charge is as great as it was in the days of Napoleon.

Cavalry (though in a few situations it may be strengthened by the support of mounted infantry) will be able to act successfully without it, but mounted infantry cannot operate strategically alone and independently of cavalry.

For horsemen armed with firearms only (even though highly trained as cavalry) cannot cope successfully with cavalry either in attack or defence.

To enable them to take the offensive they must dismount. Their led horses at once become a source of danger, while the opposing cavalry can push forward by a detour, and either outflank them or leave them severely alone. On the other hand mounted rifles cannot afford to run the risk of being caught mounted. The same argument applies to the defence.

The very soul of cavalry action lies in its power to rapidly assume the offensive. Mounted rifles do not possess this power. The recent war shows that a sudden unexpected charge shatters the morale of the enemy, and raises that of the troops so attacking as much now as in the past.

To take away from cavalry its power of assuming the active offensive by mounted action, by depriving it of the *arme blanche*, is to withhold from it a very considerable advantage without any compensating gain.

We must conclude, therefore, that cavalry must be armed with the best firearms obtainable, and with either the lance or sword.

Lancer and sabre regiments should be in nearly equal proportion in all field armies.

(b) *Artillery.*

"The aim of the artillery is to level at a distance "the material, intellectual and moral obstacles that "prevent the victorious forward advance of the other "arms of the force." It is easy to state the aim, but difficult to put it into useful effect. Indeed, artillery seems only likely to be really effective against raw troops, possessing a low morale and feeble manœuvring power, while the process of "wearing-out" an adversary requires an enormous expenditure of ammunition.

The experiences of the South African war have shown that the principles for securing victory are the same as ever, and that the best system for artillery to follow

Colonel
D. Haig,
C. B., A. D. C.
18 Mar. 1903.

Colonel
D. Haig,
C.B., A.D.C.

18 Mar. 1903.

is to hotly engage the enemy along his whole front, so as to bring about a powerful moral strain, and, if possible, disorganisation in his ranks, and then (as far as possible by surprise) to strike a rapid and smashing blow by means of a heavy concentrated fire on some suitable point of tactical importance, and at once follow it up with an assault of infantry or cavalry, or both, before its staggering effect has passed away.

To produce this effect artillery must not be used independently, but one single will must control the fire of the guns as a whole. In fact, all experiences have demonstrated the small tactical value of guns used independently, and that good results can only be obtained by the concentrated fire of a number of guns controlled by a single superior will.

The moral effect of all firing (rifle or artillery) is always greatly increased by concentration and rapidity in securing effects. But to obtain such results shells must be well placed, and this is only possible if the targets can be seen and are vulnerable.

These two conditions are the great difficulty of modern fighting, especially at the longer ranges.

(c) Infantry.

1. Infantry is, and is always likely to remain, the backbone of every army. At the same time, infantry is more readily improvised than either the cavalry or artillery arms, hence I am of opinion that if expenditure on military forces in the Empire is limited, it would be better to spend the bulk of the money in maintaining the more "technical services" efficient; namely, artillery and cavalry.

2. The principle of the infantry attack is to place your infantry (as strong as possible in numbers and in morale, and as far as possible unperceived) on to some position from which they will overwhelm the defenders with rifle fire.

3. As to the defence, in training troops sufficient care has not been taken of recent years to conceal troops holding a position. In future men may be posted at greater intervals than formerly was the case in defensive positions. Consequently a given number of men will now not only hold the same extent of front as formerly, but a larger reserve will be available for purpose of counterstroke, which is the soul of a successful defensive action.

IV.—SUGGESTIONS REGARDING THE TRAINING OF OFFICERS AND MEN.

- (a) Training in general.
- (b) Training of staff officers.
- (c) Training of regimental officers and men of the cavalry.

(a) Training in General.

One of the most difficult problems seems to be the approximation of the conditions of peace manœuvres to those of actual warfare.

At field days before the war, owing to the small area of ground available, main-bodies were allowed to become engaged before any scouting could take place. For the same reason the actions were of short duration, so that the long wearing-out process of the real battle was scarcely realised by any. Nothing less than a ten hours' action will be of practical use to discipline troops and give them a small idea of the fatigues of battle—and I take it that discipline is one of the main factors in success.

The chief danger then, in my opinion, arises from the utterly false usages hitherto practised and ingrained into our troops at peace manœuvres; and from the troops these false ideas of war filter to the people of this country, and then are voiced by their representatives in Parliament.

(b) Training of Staff Officers.

Besides training officers at the Staff College, a large proportion of officers should yearly take part in staff tours under competent officers. By this means uniformity of ideas in staff management and tactics generally would gradually be produced throughout the Army.

Again, Generals and their staffs should as far as possible be accustomed to work together during times of peace, and general officers should have a free hand in selecting their staff from qualified officers.

(c) Training of the Regimental Officers and Men of the Cavalry.

Officers commanding regiments and squadrons must

be held really responsible for the training of their commands.

But in order to give officers of all ranks a chance of learning their work strong squadrons must be maintained in peace, and suitable training grounds be provided in the vicinity of barracks where squadrons at least can be trained sufficiently to take part in regimental exercises.

The tactical training of officers can be largely developed by means of cavalry tactical tours; for this money grants are necessary. These exercises should be regularly carried out by regiments, and not by district staffs only.

Officers only require a little encouragement, and their thoughts to be turned in the right direction, to enable them to embark on a system of really practical instruction.

As Regards the Training of Cavalry Generally.

Riding.—Our officers are, as a rule, good horsemen, thanks to their love of hunting, polo, and pig-sticking (in India). Horsemanship must be encouraged for both officers and men, for the horse is the chief arm of the cavalryman.

But men must do much more riding in open country and less "show riding" in the riding house. Hitherto inspecting generals have devoted much time to the inspection of work done in the riding school, hence this kind of equitation has come to be regarded as the end and object of our training, instead of only being a means to an end.

Men must learn to move freely across country, and be instructed as ground scouts, to take cover, to carry verbal messages, judging distance, reconnoitring, etc., and their intelligence developed out of doors.

Indeed, the main lesson of the war is that modern conditions of warfare entail higher training of the individual. Of course there is nothing new in this, but the country is flooded with half-trained Yeomanry officers who proclaim everywhere that training is unnecessary, that the individual is everything, and the result is that the country believes that it has a really valuable asset in its half-trained auxiliary troops. In fact, any effort on the part of the War Office to obtain greater efficiency from the Volunteers, etc., seems to be looked upon by the country as another instance of red tape, and a deliberate attempt to destroy the intelligence and the individuality of the citizen army.

Musketry.—The tactical use of dismounted service must be developed. To this end musketry must go on all the year round, and the practices must not be confined to the rifle range. More ammunition must be allowed, and commanding officers and squadron commanders be given as free a hand as possible as to how to expend it. Every squadron should also have its range; and miniature rifle ranges should be provided in or near barracks; briefly, greatly increased facilities for practical musketry are required.

Scouting.—To improve the scouting we must begin with the officers; in Appendix B (see page 405) are given proposals for improving scouting in the cavalry.

Horsemastership.—All ranks in the cavalry must be taught to realise that the horse is their chief arm, and how to look after him in the field.

Hitherto there has been too much pampering in peace time, and casualties at manœuvres in some cases have been due to lack of hard condition.

To sum up—

1st. Maintain strong squadrons in peace, and do not transfer men from regiment to regiment.

2nd. Give troop, squadron, regimental, and brigade commanders more opportunities for training their commands in open country, where mounted and dismounted tactical exercises can be carried out in a manner resembling the conditions of actual war, and judge officers by results and promote them accordingly.

3rd. In order to enable officers to devote the requisite time to their actual instruction more must be required from non-commissioned officers in supervising men at stables and in performing minor duties in barracks than has formerly been the case.

APPENDIX "A."

(Referred to under "(e) Transport," page 403.)

PROPOSALS FOR REDUCING THE WEIGHT TO BE CARRIED BY CAVALRY IN THE FIELD.

The first consideration is to relieve the horse of weight, and this seems only possible by having two classes of transport, one to accompany the squadron

wherever it goes, and one to accompany the first line transport.

I would make the following suggestions:—

(A.) To BE CARRIED ON THE MAN.		lbs.	ozs.
Helmet (or slouch hat) - - -	-	1	8
Frock - - - - -	-	2	0
Pants - - - - -	-	2	8
Braces (or belt) - - - - -	-	0	5
Shirt and vest - - - - -	-	2	4
Drawers - - - - -	-	1	0
Putties and socks - - - - -	-	1	5
Spurs and straps - - - - -	-	1	0
Field dressing and description card - - -	-	0	2
Ankle boots - - - - -	-	4	0
Knife and hoof pick - - - - -	-	0	8
*Water bottle (full) - - - - -	-	3	0
Two leather bandoliers, with 100 rounds ammunition - - - - -	-	8	8
Sundries, such as pipe, tobacco, matches, towel, soap, etc. - - - - -	-	2	0
		30	0

(B.)		To BE CARRIED ON THE HORSE.				lbs.	ozs.	st.	lbs.	ozs.
Colonial bridle and head rope	-	-	4	0	2	3	2			
Cavalry saddle (stripped)	-	-	14	6						
Stirrups, etc.	-	-	8	0						
Saddle blanket	-	-	4	12						
Nose-bag (with 6 lbs. oats)	-	-	7	0						
Cloak—8 lbs., or British warm	}	-	10	0						
4 lbs. 8 ozs. (according to climate),										
and mackintosh or waterproof sheet,										
2 lbs.					-	-	-	-	-	-
			48		2					
			st.		lbs.		ozs.			
OR			3		6		2			

Total weight to be carried by the horse:—

	lbs.	ozs.
As above - - - - -	48	2
Arms - - - - -	14	8
Man (clothed) - - - - -	182	0
	244	10

or 17st. 6lbs. 10ozs.
Too heavy!

So the weight of the saddle and bridle must be reduced by having lighter patterns.

Wire nippers (8ozs.) to be carried at the rate of one pair per section by light men.

(C.) To BE CARRIED ON TROOP CART (43 men).

	lbs.
1 rug (G.S.) per man - - - - -	194
1 small bag per man, containing 1 day's rations, 2 days' groceries - - -	215
Few light entrenching tools (say) - - -	75
	484

(D.) ON ONE SPARE HORSE (PER TROOP).

	lbs.
*Cooking pots - - - - - (say)	34
Picketing rope and pegs - - - - -	50
	84

(E.) ON TWO SQUADRON WAGONS.

	lbs.
Small tents (1 to 2 men—7lbs.) - - -	602
Change of underclothing (at 3½) - - -	602
Horse shoes—2 boxes - - - - -	168
Two days' forage and rations - - - - -	5,088
Horse brushes and combs - - - - -	272
	6,732

(F.) AMMUNITION (PER SQUADRON).

On soldier - - - - -	100 rounds	-	100 rounds per rifle
On 4 pack horses	8,800	"	50 " "
On 1 S.A.A. cart	13,200	"	73 " "
Total - - - - -	223		

(G) TOOLS AND EXPLOSIVES IN PIONEER EQUIPMENT (PACK) AS AT PRESENT.

(H) SIGNALLING EQUIPMENT.
On 1 pack horse.

TOTAL TRANSPORT PER SQUADRON.

(C) Rugs and rations - - - - -	4 Troop carts.
(D) Cooking pots and picketing gear - - -	4 Pack horses.
(E) Forage, &c. - - - - -	2 Squad. wagons.
(F) Ammunition - - - - -	4 Pack horses.
(G) Tools and explosives - - - - -	1 S.A.A. cart.
(H) Signalling equipment - - - - -	1 Pack horse.

Total:

10 Pack horses.
4 Carts.
2 Wagons.
1 Ammunition cart.

GENERAL REMARKS.

1. On ordinary occasions a man is sufficiently provided for by a cloak (or coat warm) and mackintosh (or waterproof sheet). At night he will get his blanket from the troop cart, which should be able to accompany the troop wherever it goes. A picketing peg is unnecessary if rope and pegs are carried on a lead horse.

2. I have found in practice four men generally like to mess together, and one cooking pot among them takes the place of a mess-tin or "dixie."

I recommend that some form of cooking vessel be provided which fits into another, to take the place of the dixie and the mess-tin or "billy."

In the event of a group being detached, a set of cooking-pots should be capable of being attached to the saddle temporarily.

These cooking pots and the picketing rope and pegs can easily be carried on a mule or spare horse at the rate of one per troop.

3. Horse brushes and combs are unnecessary except when a force halts for more than 12 hours, when, as a rule, the squadron wagons will be up.

4. 152lbs. or 10st. 12lbs. has been allowed for the average man naked. This accords with experience during the recent campaign, but I do not think the average Cavalry soldier ought to weigh more than 10st. 7lbs. stripped.

This, I am aware, is impossible if the Cavalry ranks are to be filled with Reservists on mobilisation, and is an additional reason for the maintenance of strong cadres in time of peace.

APPENDIX "B."

(Referred to under "As regards the Training of Cavalry generally." See page 404.)

PROPOSALS FOR THE MORE EFFICIENT TRAINING OF CAVALRYMEN AS SCOUTS.

1. Twelve non-commissioned officers or men per squadron, possessing exceptional intelligence, courage, nerve, and eye for country, besides being good riders and horsemasters, to be specially trained in each squadron under a specially chosen officer to act as scouts.

2. After a course of training sufficient to fit them to discharge the duties of scouts for special patrol duty (say about six months, depending on the opportunities offered in the district where the regiment is stationed and the aptitude of the individual), a selection of the 14 ablest to be made. The latter to be called Regimental Scouts, and undergo a further training under a specially-chosen officer, who might be called the "Regimental Scout Master."

The standard of efficiency of these latter must be the highest possible; they should be able to work as well by night as by day, with a view to passing unobserved even through an enemy's lines at night.

The training of Regimental Scouts should be continued systematically during the whole year.

3. Each Scout to be provided by Government with a telescope or good binoculars.

Two horses to be allowed per scout.

Arms: short rifle and revolver (Colt repeating).

4. The following will be the establishment and rates of pay of Squadron and Regimental Scouts.

NOTE.—In view of the arduous nature of the training, the rates of pay are proportionately higher.

* In many countries this would not be necessary.

Colonel
D. Haig,
C.B., A.D.C.

18 Mar. 1903.

Colonel
D. Huig,
C.B., A.D.C.
—
18 Mar. 1903.

(a) *Squadron Scouts.*

1 Sergeant, 3s. 2d. (usual rate, 2s. 10d.)
1 Corporal, 2s. 8d. (usual rate, 2s. 2d.)
6 Privates, 1s. 8d. (usual rate, 1s. 4d.)
with distinguishing badge of "S," gold or worsted,
according to rank.

(b) *Regimental Scouts.*

1 Officer, 5s. extra per diem.
1 Sergeant-Major, 4s. (same as S.Q.S.M.R.R.)
1 Sergeant, 3s. 6d. (same as S.Q.M.S.)
2 Corporals, 2s. 10d. (same as Sergeant)
10 Privates, 2s. 2d. (same as Corporal),
with distinguishing badge of "S." within a circle (gold).

N.B.—After 1st April, 1904, all to receive the extra 6d. per day granted by Army Order No. 66 of April, 1902.

19300. I do not think I have any question to ask with regard to the posts held in South Africa, except that I gather that in the earlier part your experience was entirely on the Staff?—Yes.

19301. And then, after 1901, you had commands of various kinds?—Yes.

19302. All of those commands, I suppose, had chiefly to do with mounted men?—All mounted men—yes; at times in some of the commands there was probably a company of infantry. In Cape Colony there were a lot of these Town Guards, and when I went into a certain district they were not actually under my command permanently, but they co-operated with me, and took orders from me. That was got in Cape Colony during the rebellion there.

19303. Even the Town Guards?—Yes, the Town Guards were in certain villages, and I would let them know if I was driving an enemy up towards them; although they were not actually under my orders, they co-operated if I wanted them, for instance, to block a place in the vicinity.

19304. They never moved far from their own locality?—No, but they had local mounted men with them who did move.

19305. The first point you call attention to is the staff, I think?—Yes.

19306. You think that under present arrangements or under the arrangements that existed before the war there was no machinery for making the staff perfect in peace time?—No.

19307. Do you think that can be done?—I think, certainly, with forethought, if you think it out beforehand and train the men for the staff.

19308. (*Sir George Taubman-Goldie.*) Where are you at present?—I am at Edinburgh, in command of the 17th Lancers.

19309. And you have no opportunity of seeing whether it is being done now or not?—No, things are improving.

19310. Under the present system?—Yes, but I have no means of knowing as a fact.

19311. (*Chairman.*) But it is a feature of the present system that in the Army Corps there are to be staffs ready to move with the Army Corps; is not that so?—I believe they are making progress in that way.

19312. Would that be sufficient to meet what you think is required?—You see, the brigades are not properly formed yet; there are only ten cavalry regiments at home, and they have got a brigade staff at Aldershot and one at the Curragh, but, then, as far as I know, I do not think they have actually got all the troops there—they have only provisional requirements at some of these places.

19313. Naturally, it is in a state of transition at present?—Yes, and I do not think it quite fair to judge of it at the present moment.

19314. But if it was organised in brigades, as I understand is part of the system, would that brigade staff be sufficient to meet the objections which you had to the staff in South Africa?—I think so. Of course, the main question is to train the staff and troops together in peace.

19315. You remark here in your *précis* that a General was not allowed to select his own staff. Do you think a General ought to select his own staff?—I think, certainly, in order to work together; but I say they should

select them from qualified officers. I do not think it right that a General should take all his sons and nephews and friends of that sort on his staff, but if you had qualified officers on a certain list, and said, "Take your choice from that," that would be a good arrangement.

19316. Does not the idea of the present system go further than that—that the Staff will be organised in peace time under the General?—Yes, but, of course, that is a question of the future; I was dealing with the past.

19317. That was the principle on which all the Staffs were appointed, was it not, that they were appointed by superior authority?—Yes.

19318. With a great number of Staffs to appoint there is possibly something to be said for that?—I think the first thing is to have unanimity on the Staff; the General must be able to get on with the people who are about him, and especially, I think, the Chief Staff Officer ought, if possible, to be a friend of the General.

19319. Do you think difficulties arose from that method of selection?—I think on some of the Staffs there is no doubt they did.

19320. We have had a good deal of evidence from the Generals, who have expressed themselves as well satisfied with the Staff?—I would like to put it on record that I think a General Officer ought to be allowed to select his Staff from qualified officers.

19321. Do you mean by that officers who have been through the Staff College?—Yes, and who have had a Staff training.

19322. Of course, in the case of the war I suppose there were not sufficient officers who had that qualification?—No, I suppose not.

19323. The taking of officers from regiments is detrimental to the regiments also, in addition to their not being so well qualified?—Yes, and also because the number of officers with a regiment is limited.

19324. I suppose you would desire that an officer who had qualified for the staff should not lose touch with his regimental duty?—Of course he ought to go back to regimental duty from time to time.

19325. He ought to take a turn on the staff, and then go back to his regiment?—Yes.

19326. And there would be no hardship in that?—No, I think, of course, you might arrange, if he was a good man, to send him back in a higher rank than when he came to the staff; supposing he came from a regiment on to the staff, and served a certain number of years, then when he went back to regimental duty he might go back with a higher rank.

19327. Do you think that is necessary?—I think that would encourage officers to qualify for a staff appointment.

19328. Do you think the inducements to qualify for staff are not sufficient without that additional one?—No, I do not think they are; what does he gain if he goes to the staff?

19329. (*Sir George Taubman-Goldie.*) Are there not more men who want to go to the Staff College than they have room for?—Yes, but I think some of the inducements are because they are settled there for two years, and they are able to take a house for two years, and if they are married men they are able to sit down quietly.

19330. Still there are inducements of a kind?—I have mentioned inducements why many go to the Staff College, but after that I do not see that the inducements to serve on the staff are very great.

19331. Nearly everybody is anxious to serve, I think?—I do not think so; there are a number of regimental officers who are quite happy.

19332. (*Chairman.*) Have you anything else to say with regard to the staff?—No, I have not.

19333. Is there any other form of training you would wish to suggest besides the Staff College as training for the staff?—Yes; tactical tours.

19334. Does that mean that after they pass through the course at the Staff College they ought to take these tours?—I think every year these staff tours should be carried out, and not only carried out by the staff, but also in regiments. The advantage of these staff tours is that they deal with everything as if it were on active service; in peace manœuvres you are hampered with

ground, you are limited by the state of the country, and the crops, and so forth ; whereas in these staff tours you take everything exactly as if it was on service.

19335. How is that managed ?—Of course the enemy is not there, but the General is sitting in a certain place, and he gets reports in message form as he does on service. These messages are sent in from the Director of the Staff Tour, so that the General actually has the military situation the very same as it would be in war, only, instead of the information emanating from a man seeing the enemy, it emanates from the brain of the director.

19336. Is the staff tour simply a tour of officers ?—Yes, it is a tour of officers, and the director takes a military situation, issues general and special ideas, and works out details based upon those ideas. For instance, let us suppose a brigade is ordered to halt for one night you have then to consider the cantonments, and issue the orders for billeting the troops ; every detail as to where the men would be, and the outposts for protecting them are considered with reference to that particular situation, and not with reference to generalities. I think what leads many to form wrong tactical conclusions is that we so often deal with generalities instead of taking a special case ; our tactics are too much adapted for suiting all occasions, instead of one particular case.

19337. By those sort of tours you think the staff officer should get useful training ?—It makes him think, and it is practical, because, provided he is under a good director, you take every situation, halting orders, orders for attack and defence of positions, for reconnaissance for marches, and consider supply questions ; of course, if you have got a stupid man as director, and who is not practical, you will not get good results.

19338. A great deal depends upon the director ?—Yes, but the training of officers as such is a mere question of time.

19339. (*Sir George Taubman-Goldie.*) Would you say that officers, on the whole, learn more from staff rides than they do from the ordinary manœuvres as conducted at present ?—No, I think you want to combine the two. I say the advantage of a staff ride over manœuvres is that you can actually take war situations in the staff rides ; this you cannot do really in manœuvres.

19340. Do you think the men learn much at manœuvres ?—That depends on the manœuvres.

19341. We have had evidence to the effect that they learn very little indeed ?—I do not agree with that. I think it is absolutely essential that they must go to manœuvres, and essential for the officers also to handle the men at manœuvres. Of course there again it is all a question of who is directing and the nature of the manœuvre area.

19342. (*Chairman.*) With regard to the cavalry in the war, at first there was little or no organisation ?—Yes.

19343. That, I suppose, was inevitable under the circumstances ?—Quite so. I think the best was done under the circumstances, and as I say further on about the Brigades when we left Modder River on the march to Kimberley, we actually left with new staffs, and regiments hastily put together in brigades, but it could not have been helped ; the organisation did not exist before.

19344. When you say it is a grave error, you admit that it was an error which could not have been avoided under the circumstances ?—I mean it was an error not of the military people on the spot, but an error of the authorities at home not to have organised during peace ; those that are responsible for the organisation of the Army are to blame, and it was a great error on their part.

19345. Did the organisation of the Army itself, if there had been proper forethought, provide for such an organisation as you required on the Modder River ?—I think it ought to have provided for it.

19346. Did it do so under the organisation as it then existed ? Was there any organisation ?—There was no organisation—that is the fault I find—there was no organisation before the war to meet a situation such as we had in South Africa or even a smaller situation than that.

19347. In what way was there no organisation ?—I think that they ought to have maintained Cavalry Brigades and a Cavalry Division as a unit in peace

time ; they ought to have been organised and trained for war.

19348. Cavalry were sent out in Brigades, were they not ?—They were sent out in two Brigades, they were mobilised in the two Brigades. But neither regiments, brigadiers nor staffs had worked together in Brigade or Division during peace. We had four Brigades eventually in the Cavalry Division.

19349. That was owing to the circumstances of the war ?—Yes.

19350. That is inevitable, is it not ; the circumstances of any war might lead to modifications like that ?—No, I do not think so ; if you think out the situation beforehand you will have an implement suitable for whatever work is likely to have to be done. I think that this sort of work is the duty of the general staff.

19351. Do you mean a regular plan of campaign before the expedition starts ?—Yes.

19352. Complete down to the organisation of each Brigade ?—You would estimate that so many troops are necessary, in the event of war with such and such a State, and according to the number of troops mobilised, the force would be divided up into Brigades and Divisions.

19353. But still you would have to maintain a good deal of discretion for the General on the spot ?—You cannot improvise once war has broken out, as a rule there will not be time. I think that is the teaching of history—you cannot improvise and organise an army in the theatre of war.

19354. But if the General on the spot finds circumstances such that he cannot act upon the plan given him beforehand, would he not have to improvise ?—Undoubtedly he will have to improvise, but you started by asking me should not these things have been organised beforehand, and I say they ought to have been foreseen.

19355. (*Sir George Taubman-Goldie.*) Were they not organised into Brigades before they left England ?—They organised two Brigades.

19356. That is what you wanted ?—No. The Brigades did not exist as fighting units before they mobilised for South Africa.

19357. They ought to have organised two more Brigades ?—The four Brigades ought to have gone out complete, and we ought not to have had to organise four Brigades out there ; the regiments were in England, but they had not been organised into Brigades before war broke out.

19358. The first two Brigades had ?—No, the 10th Hussars, for instance, were at Shorncliffe or Canterbury, and it was not a Brigade in peace time before it went out. They were mobilised and then concentrated, and went out as a Brigade, but they had not been a Brigade actually in peace time.

19359. You wish to keep them as Brigades in peace time ?—I should say Cavalry Brigades and a Cavalry Division ought to be complete as units in peace time with the staff and regiments together, so that they are all accustomed to work together, and then take the field together.

19360. Does that apply to the divisional staff, too ?—Certainly.

19361. (*Viscount Esher.*) Is not that the idea underlying the new organisation—I do not say it is to be carried out, but it is the theory of the new organisation, as far as you understand it, or as far as we understand it ?—I daresay—let us hope so.

19362. Your point is the point which has been taken by the Secretary of State for War ?—To be ready—yes.

19363. (*Sir Frederick Darley.*) You mean that the regiments in a brigade ought to work together at home ?—Certainly they ought to work together and to be together in peace time, so that you know exactly what you can do with them.

19364. (*Sir George Taubman-Goldie.*) And the Brigade Staff ?—Yes.

19365. And the Divisional Staff ?—Yes ; I do not think you could actually have them, say, at Aldershot, because you have not got the ground there ; but I think you ought to work them together during the year for manœuvres, so that you would know exactly what the

value of so-and-so is, and all ranks would get to know their duties.

19366. (*Chairman.*) There was a difficulty in keeping up the strength?—Yes.

19367. Was that owing to the want of men or the want of horses chiefly?—The want of horses. I think the men were in the country, only there was not the machinery in existence for keeping the squadrons actually in touch with the enemy up to war strength. You see, the country was very big, and the men drifted away to posts on the communications, chiefly from want of horses, I think.

19368. You mention about the squadrons afterwards, but in the first place I understand you are speaking of horses; was that because horses were not in South Africa or were not at the front?—Of course, it depends upon what time of the war you are speaking of; at the beginning of the war, of course, there were lots of horses in South Africa if they had taken them—in Cape Colony, for instance.

19369. If they had impressed them?—Yes. They did not collect the horses there.

19370. They had not martial law, and therefore could not commandeer them?—No.

19371. That we have heard, but I want to know whether you thought it was because there were not horses sufficiently provided either by commandeering or by being sent into the country, or whether it was that the horses were not at the front at the moment you wanted them?—I do not think the horses were actually in the hands of the military; the military did not have them to send to the front.

19372. (*Sir George Taubman-Goldie.*) Not anywhere in the country?—Not anywhere in the country.

19373. (*Chairman.*) But that was because they were not commandeered?—No. For two reasons; if you could have commandeered the horses you would have had horses, or if you were not able to commandeer you ought to have had other horses brought from over sea, but the fact remains that the men were not mounted because there were no horses.

19374. Taking this case of the march to Bloemfontein: at that time, of course, you lost a great many horses in the ride to Kimberley and back to Paardeberg?—Not many, if one considers the hardships, climate, want of water, and length of march without rest or food.

19375. I suppose it would have been almost impossible to supply that deficiency at the moment?—There was not a very great loss of horses, it was only about 1,700. General French gave you the numbers, and I have the numbers in this book here, but I think these horses could probably have been supplied if new corps had not mounted, such as Roberts' Horse and Kitchener's Horse.

19376. The point I am taking is, do you not think that at that particular moment the difficulty would have been, supposing the horses were at Cape Town, and they may have been at Cape Town, could they get them up to Paardeberg?—No, I do not know about the difficulty of the railway transport, but I feel sure that if the horses had been in South Africa the Headquarter Staff would have got them up.

19377. We have had it in evidence from several witnesses who could speak to the facts that in the case of the delay at Bloemfontein there was an inevitable delay because of the difficulty of getting horses, among other things, up to the front?—That is when they changed the base, but we did get a few remounts from Cape Town when at Paardeburg, and we also got horses out from Kimberley. I think Mr. Rhodes or the De Beers people provided us with some horses—not very good ones; I think 100 or so.

19378. That is additional assistance you got in that way, but I am looking more to the general provision that was made at the base at Cape Town, and you think if the horses had been at the base they could have been provided in time to remount the men at Paardeberg?—Some few remounts did reach us from the Base, and, again, it should be remembered that the dismounted men had gone back to the line, so that they could have easily ridden out. Paardeberg was no distance really from the railway—one day's march from Kimberley.

19379. May I put it in this way: You do not know the state of the dépôt at Cape Town at that time?—No, I do not, and I do not know the actual number of trains

that were running from there, but I think that if the horses had been there we would have got them.

19380. No doubt the experience of the march showed that additional horses had to be sent up, and a message had to be sent to England for them?—Yes.

19381. (*Viscount Esher.*) Were they constantly moving horses up the line in anticipation of their being wanted by General French?—They were always keeping horses moving up to the dépôts at the front.

19382. (*Sir George Taubman-Goldie.*) You think the difficulty as regards horses really began when the base was changed when you got to Bloemfontein?—I said that with reference to the question I was asked—could the horses have come forward then? I said no, not when we got to Bloemfontein at once, because at that moment the transport of food was such a difficulty.

19383. Your difficulty as regards getting the horses fed was much greater at Bloemfontein than it had been when you were on the Kimberley Railway?—Yes, but the horses eventually came up as soon as possible after the food supplies had been regulated.

19384. (*Chairman.*) We have the facts about that, but even the Kimberley Railway is a single line too?—Yes, they are all single lines.

19385. And you had to send up the supplies as well as horses by the Kimberley Railway?—Yes, as far as De Aar, which is the junction for the Bloemfontein line.

19386. (*Sir George Taubman-Goldie.*) I rather wished to see why you drew a distinction between the time you were at Paardeberg and the time you were at Bloemfontein?—At Paardeberg we were drawing our supplies of horses all from the old Kimberley line; then when we moved across to Bloemfontein—it was quite a wide detour by Naauport, and the line had all been destroyed—it was some time before the railway was in working order and the horses came forward.

19387. (*Chairman.*) But your chief point is that it would have been better to have kept the regular cavalry horsed than to horse the additional men?—Yes, than to horse the irregular corps recruited at this time in the seaports.

19388. I suppose you do not want to represent those corps as otherwise than useful corps—Kitchener's Horse, Roberts' Horse, and so on?—I can give you a fact, and I have a message here which proves it. There was an officer in command of a squadron of Kitchener's Horse when we reached the Riet River who handed me a written statement that he had lost about 10 men—I can give you the exact number if you think it is important—and so many rifles. He had lost these rifles and horses and men during the march from Randam to where we crossed the Riet River, and that was an easy march. The following is the information about the matter taken from the diary. On Monday, February the 12th, at De Kiels Drift, on the Riet River, Major —, commanding E Squadron of Kitchener's Horse, reported that during the march from Randam to De Kiels Drift, nine men, six rifles, and seven horses were lost owing to the inefficiency of the men.

19389. (*Sir John Edge.*) What was the distance covered by the march?—Under 20 miles.

19390. (*Viscount Esher.*) Your point is that they were not worth mounting?—Yes, at this time a large number were not worth mounting.

19391. (*Sir George Taubman-Goldie.*) And if you had only one horse between two men, one trained and the other untrained, you would desire to put the trained man on the horse?—Yes. Of course, afterwards these corps got trained and they became very valuable fighting units, but at this particular time I am speaking of they were not.

19392. (*Viscount Esher.*) Whose fault was it? Who decided that the horses were to be appropriated to Kitchener's Horse rather than to the trained cavalry?—I suppose the Commander-in-Chief.

19393. (*Sir John Edge.*) Were these men unable to ride?—Presumably so; these people had never seen the enemy at all, and they were marching behind the Cavalry.

19394. And simply tumbled off their horses?—Yes; and this officer, a very excellent officer, came and made this report to me as Assistant Adjutant-General of the Cavalry Division.

19395. (*Chairman.*) Were the men recovered?—I do not know.

Colonel
D. Haig,
C.B., A.D.C.

18 Mar. 1903.

19396. (Sir Frederick Darley.) I think that corps was raised in Cape Town?—Yes.

19397. They were supposed to be the wasters of the place?—Not at first; I think they had some good men to begin with, and I think it was latterly, in 1901, that all these corps degenerated. To start with I think they were pretty good men.

19398. (Sir John Hopkins.) They did not take their horses out of the dépôts, did they?—I do not know how they mounted Kitchener's and Roberts' Horse to start with.

19399. I have some idea that a great many of those irregular corps provided their own horses by picking them up?—I do not think that was the case with the squadron referred to.

19400. (Viscount Esher.) Had the horses used by these corps been available for the cavalry division, how would you have proposed that cavalry brigades moving as rapidly as yours could always have been supplied with remounts?—I state later on—by having reserve squadrons mobilised as a dépôt. Then as men become dismounted they are sent back to this dépôt, and when remounted rejoin their regiments as a complete unit.

19401. (Chairman.) Then in that case in any cavalry regiment that was engaged in this march to Kimberley, the men that were dismounted would have had to go back to the dépôt at Cape Town, or wherever the base was, and to come up again?—I think a dépôt would then have been organised, say at De Aar or at some other suitable place.

19402. Wherever it was?—Yes, not as far back as Cape Town.

19403. But they would have gone back to the base, wherever it was?—Yes; if you had had your reserve squadrons out in South Africa organised as a cavalry dépôt, those men who became dismounted during the march to Kimberley would have rejoined you later on, probably at Paardeberg.

19404. I only wanted to understand the system you proposed, and that is the system—that if on a march like that to Kimberley the men had been dismounted they would have gone back to the base and been replaced by mounted men from the dépôt?—Yes.

19405. (Viscount Esher.) Is that a better plan than remounting them there and then if you could do it? One would imagine that if a man was dismounted the thing you would want at once to do would be to put him on a horse again if you could get one?—Yes. You must consider the loss in saddlery and the difficulty in bringing horses forward by detachments. I think it is everything to have the discipline which exists in an organised squadron, as against one not organised. Again, how will the dismounted men keep up with the column until remounts arrive?

19406. But in your ride to Kimberley, how many horses did you lose as you were actually going along? I suppose what happened actually was that horses fell dead during your march, did they not?—Not exactly, many were reduced to a walk, but were able to come into camp late at night. If there had been a dépôt to send these horses to, it would have been a great advantage. We did leave a number of worn out horses in Kimberley; some of them rejoined us later on. They were dead tired and worn out. As to those that straggled into Paardeberg, there was not enough food to freshen them up, and, besides, the work there was so hard that men had to be mounted on any animal that was fit to crawl, and these horses, of course, suffered more and more, and died. I think the want of forage is one of the reasons which caused a large number of casualties.

19407. Then according to your idea, when a man is dismounted in that way, he would have to walk back to the base, wherever it was, or get back as best he could?—There are always wagons going back.

19408. (Sir Frederick Darley.) Would it be possible to have spare horses running with the troops?—Yes, we have had that system, and latterly we always took spare horses. At the commencement of the war, when it was proposed that the cavalry should leave Ladysmith, the plan was to take 5 per cent. led horses.

19409. Supposing you took 25 per cent. spare horses with you, so that when a horse was tired and could only walk, the man might dismount and put a saddle on a fresh horse, and let that horse run spare?—We tried that, but 25 per cent. is a large number. You can do it

with ponies on the veldt that are accustomed to be driven, but if you are going along at any pace, horses that are driven get knocked about, they knock one another about, galloping over the rough ground.

19410. But once they are accustomed to going that way. I am talking of what I know something about, namely, overlanding in Australia; there may be perhaps six men with a large quantity of overlanding cattle; those six men will take perhaps some 60 horses with them, and as they can only ride six there would be some 54 horses running spare, and they may change horses four or five times a day?—Yes, but you have the whole ground open to you; in the case of a force on the march you have wagons on the roads and many troops, so that the horses get jostling in and out between the troops and vehicles.

19411. Once the horses get a little accustomed to it they run just like dogs?—I quite agree it is an excellent thing, but 25 per cent. is a large number in addition to the troops you already have on the road. In Cape Colony we always had spare horses running.

19412. I am speaking of men who might be three or four months on the road?—Yes.

19413. (Viscount Esher.) You do not train men to run horses in time of peace in that way with cavalry regiments?—We have not got enough horses for it.

19414. And they have no experience; what Sir Frederick point out is that a man requires experience, but the cavalry soldier has no experience?—I do not think that comes into the present case, because in South Africa we had lots of natives and men who had experience to drive the horses.

19415. You mean that you acquired experience in South Africa?—No, to start with there were these Cape Boys.

19416. You could use Cape Boys?—Yes.

19417. (Chairman.) But there would have been difficulty in feeding them?—Great difficulty, and also in watering them; there is very little water in that country, especially in the height of summer.

19418. Such a large addition of horses would have complicated matters very much?—Yes.

19419. (Viscount Esher.) The Boers had more than one horse apiece, as far as you knew. Had not a Boer sometimes two or three ponies?—Some had three; I have seen them ride one and lead two, and they put all their packs on led horses.

19420. They manage to cope with the difficulty of watering and feeding, and so on?—About which particular time are you talking? If you talk of the Kimberley time, the Boers were always falling back then, and they had not the same long marches that we had to make. It is so much easier to fall back from a position with your horses fresh than to make a wide detour to outflank the enemy and also retain horses fresh enough for pursuit.

19421. I was thinking of the 25 per cent. additional horses; they in point of fact had 150 per cent. in some cases?—Yes, but what do you think that proves?

19422. I was only pointing to the fact that it does not seem to me that the difficulty of coping with 25 per cent. led horses would have been insuperable if you had happened to have them, but you did not have them?—Look at the difference in the circumstances of the two forces. I think we had 6,000 or 7,000 animals there; there was not enough water really for that number at that particular time. If you are to strike a blow you must be concentrated, while if you are merely operating, as the Boers were, and falling back, troops may be kept more scattered.

19423. (Lord Strathcona and Mount Royal.) Your spare horses were generally in charge of natives?—Yes.

19424. How many spare horses could one man look after?—Do you mean on the march?

19425. Yes, on the march?—Latterly we drove them as Sir Frederick Darley has suggested.

19426. I ask the question because I have seen a good deal of that sort of thing myself?—Latterly we drove horses with the columns always, but, of course, at the commencement the point I wish to make is that when you have got your cavalry concentrated to strike a blow you cannot have this very large proportion of 25 per cent. of spare horses; you may have, say, 5 per cent. spare, but you cannot have that very large proportion of 25 per cent.

Colonel
D. Haig,
C.B., A.D.C.

18 Mar. 1903.

19427. But the trooper could not lead another horse?—Certainly not, and fight; when the soldier has got to fight he must have only one horse, and be lightly equipped for fighting.

19428. The Boers were in the habit of leading their horses. were they not?—Yes, on the march, but they had natives, too.

19429. Who had charge of them specially?—Yes, and when they were fighting they had only one horse; the led horses were in a different column further back.

19430. (*Chairman.*) You are satisfied with the physique and intelligence of the men?—Yes, the Reservists were rather too big—I mean they were fat, and too heavy for horses.

19431. How are we to avoid that?—By keeping stronger cadres in peace time, and transferring fat men to infantry.

19432. And not relying on reservists?—You should not require to call up the reservists on mobilising cavalry.

19433. Then you think the Reserve system has not worked so well in the cavalry as in the infantry?—The reservists did excellently, but you asked me how we were to avoid having these very heavy men; you see the men in civil life get very fat, and some of them, I say, ought not to have been put upon horses, as they were too heavy.

19434. I only say, therefore, that the Reserve system as it exists does not work so well practically for the cavalry as it does for the infantry?—No.

19435. You would rather have the cadres complete?—Yes, stronger in peace time, so that only very few reservists are required on mobilisation.

19436. If there are to be reservists, what do you mean by reservists going to more than one regiment being pernicious?—A man is enlisted first of all for the corps of Hussars. Although he may say: "I want to enlist in a particular regiment, say the 7th Hussars," he is told, "We do not enlist for a special regiment, but we will enlist you for the corps of Hussars." Then he is posted to a regiment, say, at home; possibly a Hussar regiment in India wants a draft, and they draft him from his regiment at home out to the regiment in India; next possibly his new regiment in India may be sent home, and he is transferred to another Hussar regiment out there to finish his term of enlistment, so that there are three regiments he has been in. Lastly he goes to the Reserve, and on mobilisation is probably called up for a fourth. Do you follow me?

19437. Yes, I think I do, that the men do not belong to a special regiment in the same way as they do in the infantry?—In the infantry they have the linked battalion system, but in the cavalry they enlist men for the corps of Hussars, or the corps of Lancers, or the corps of Dragoons. I think they ought to enlist a man for a particular regiment, say the 7th Hussars, and he ought always to be a 7th Hussar.

19438. (*Sir George Taubman-Goldie.*) Supposing the 7th Hussars were in India at the time the Reserve men were wanted at home for a war in South Africa, you would want the Reserve men to join some other regiment?—Regiments at home ought to have enough of their own reservists to make them up to war strength if squadrons were kept at full strength during peace.

19439. Have we not found that in time of great stress we want the whole of the reservists?—Were all the cavalry reserves called up? I do not know, but it seems to me that the arrangements should be that cavalry regiments should be strong enough to take the field at once without calling up reservists to make them up to war strength. Continental States do this because cavalry cannot be improvised.

19440. Would your system be that during all the years a regiment was serving in India its Reserve man should be practically not available at all in case of war elsewhere?—I think you could arrange that.

19441. Could you arrange it in any other way in case of war than by sending the men to a regiment where that war is?—In the case of war it might be done, but why transfer a man in peace time from one regiment to another? You ruin the idea of *esprit de corps* by transferring men from regiment to regiment in peace time.

19442. (*Viscount Esher.*) What was the argument for it? There must have been some reason. Do you know at all?—Because some regiments have smarter uniforms than others, and always can get more recruits.

19443. (*Sir John Hopkins.*) What do you give for your horses now?—I think about £40 is the price of a cavalry horse.

19444. (*Chairman.*) Another heading you have here is: "Want of Transport." In that you are particularly speaking of the light regimental transport to be close up to the fighting line; is not that so?—Yes; we ought to have some light transport to come up every night with the squadron, to reduce the weight carried on the horse.

19445. In order to relieve the weight on the horse?—Yes.

19446. Which you consider to be excessive?—Quite excessive.

19447. You have given us in Appendix A (*see* pages 404-5) details?—Yes; I had it worked out in South Africa, and I thought it as well to tack it on. I have been thinking about it for a good long time.

19448. Is that what you propose he should carry—17st. 6lbs. 10ozs. the present weight on a horse?—That is the total weight to be carried by a horse, presuming no alteration is allowed in the pattern of equipment.

19449. I did not quite understand?—No, that is far too heavy. I say the weight of the saddle and bridle must be reduced by having lighter patterns; I think we ought to reduce the total weight on horse down to 14 stone.

19450. You head it "To be carried on the man" and "To be carried on the horse," and we were not quite sure whether that meant your proposals or the present weights?—I am taking the actual equipment as existing at present in A and B, and I say that unless you alter the equipment that is what must be carried, and that, after reducing it to the bare necessities, the total comes to 17 stone 6lbs. and 10oz., and therefore I argue that we must have a lighter saddle, and reduce the weight of some other things. I have put down the bare necessities; you cannot make a man go out with less.

19451. You think you could reduce the 17 stones to something like 14?—I think so.

19452. That is on the basis of having a man about 10 stone 7lbs. in weight?—I think if you do not hang so many things on to the saddle you can do with a very much lighter saddle; the weight of the present saddle stripped, without anything else, is 14lbs. 6ozs., and that does not allow for the stirrups and the saddle blanket; there are 2 stone 3lbs. 2ozs. simply for the saddle, and the accessories of that saddle alone, which is very much too heavy.

19453. (*Lord Strathcona and Mount Royal.*) You speak of the colonial bridle; in what does it differ from the ordinary bridle?—The cheek of the bit is bent in form.

19454. Much lighter?—Yes, instead of being a bit and bridoon, it is of the nature of a Pelham; there is no snaffle part, and it is bent back like that (*describing*).

19455. And you recommend it in preference to the other?—I think so, but it is impossible to have a universal pattern of bit to suit all horses.

19456. (*Chairman.*) Have you considered what sort of light transport would be required for that purpose?—It depends upon what country you are operating in; I think it is good always to take the transport of the country as far as you can. If it is a mountainous country it will have to be pack transport—mules or horses. Latterly in Cape Colony we used led horses for carrying a lot of things.

19457. Light carts?—Light carts if there are roads; but transport has to get across dongas and rough ground, so a two-wheeled cart sometimes does not go so well along as a light four-wheeled cart. I think the kind of transport depends very much on the particular country in which you wish to operate.

19458. Speaking of that sort of transport, you are not dealing with the transport for supplies?—No. This is light transport, to relieve the horse of some articles now carried on the saddle.

19459. Were you satisfied with the transport of supplies?—Yes, there were a very great many difficulties to contend with, and I think it was satisfactory.

19460. As to the Remount Department, you have said a good deal as to the horses. I understand you to say that the quality of the horses deteriorated as the war went on?—Yes, latterly there were more horses suitable for vans—the Hackney sort—not well enough bred.

Colonel
D. Haig,
C.B., A.D.C.
18 Mar. 1903.

19461. You refer chiefly to Hungarians?—Even the North American horses, too, which I came across were a number of them underbred.

19462. Too heavy?—Much too heavy.

19463. (*Lord Stratheona and Mount Royal.*) What would you consider the proper size for a horse?—I think a good average size would be about 15 hands.

19464. That is not too high?—15 hands is a good height, but we want a well-bred horse.

19465. (*Chairman.*) In most of these cases it was necessary to use these horses so soon that only a few could be expected to stand the treatment?—Yes, but even if they had been used in this country, I question if they could have carried weight, because they had not been accustomed to be saddle horses.

19466. Those in the latter part of the war?—Yes, and even at the commencement there were a number of horses that had not been trained; what we found was that the horses that had been trained as cavalry horses, and had their muscles developed, lasted very much better than the remounts that were sent out.

19467. Do you want to say anything more about the horses?—No.

19468. You draw a distinction between cavalry and mounted infantry, and I understand you to say that they must be kept entirely separate?—Well, I first of all state that I would not have mounted infantry at all; I think a well trained cavalry ought to supply all the requirements of mounted troops. Mounted infantry, owing to their infantry training, will be chiefly valuable then on the battlefield as mobile infantry. In that case I recommend to put infantry on motors or bicycles, and only in very exceptional cases to put them on horses. I hold that if cavalry is properly trained to make use of the carbine, they ought to suffice for all the requirements of mounted troops in our Army.

19469. But the cavalry training you require is a cavalry training including a weapon of offence; it is not merely a mounted rifle corps that you wish as cavalry?—I say cavalry trained to act mounted and dismounted.

19470. But trained also for shock tactics?—Most certainly.

19471. Did you find in any case a disadvantage from the mounted infantry in South Africa not having a weapon of offence?—We always had cavalry. When the sword and lance were taken away from the cavalry we did miss them. It was a great mistake, and moreover, General Smuts, who arranged the details of surrender with me in the west of Cape Colony, said that it was the greatest mistake to take away the sword and lance from the cavalry, because he said that they always estimated that if they got within 200 yards of a position they could take it, owing to the bad shooting of the British, but he said that if cavalry had been there he would never have attempted to go near the position, because the cavalry would have charged down upon them with the *arme blanche*. That opinion he volunteered.

19472. Was the sword and lance definitely taken away in South Africa?—Yes; just after Lord Roberts came home I think the sword and lance were sent into store in some commands.

19473. And the cavalry had nothing but their carbines?—Except a few; a few regiments—those under General French—retained their swords. I can give you instances where the 10th Hussars in Cape Colony charged in with their swords and captured a laager in the Clanwilliam district, and other instances of the success of troops armed with the sword. Again, only cavalry could have relieved Kimberley. I mean neither mounted rifles nor mounted infantry alone could have broken through the Boers near De Kiel's Drift.

19474. And you would like to keep both the sword and lance?—No, I say I would like to have some cavalry armed with the sword and some with the lance.

19475. That is what I mean?—You know at present the Lancer has a sword as well, and that is rather too much, I think. I do not say that we want a lance as long as we have at present, but I think a lance more like a hog spear, a shorter one, with a counterpoise at the end, would get over the difficulty of carrying it when acting dismounted.

19476. We had some evidence from one witness who said that if the rifle had a short bayonet attached it would be practically very much like a hog spear?—I do

not think so, because the balance is wrong. We tried it with the New Zealanders at Colesberg, and it is all very well to impress an enemy at a distance—the moral effect may be all right at a distance—but if you come to use it it is a very different thing. At the very commencement the New Zealanders came to Colesberg, and they had not a sword, and I remember General French trying them with a bayonet on their carbines, and, of course, they could use it, but not as an effective weapon really.

19477. What sort of a sword would you have?—I think a thrusting sword.

19478. A lighter sword than at present?—Yes, a light straight sword; at present the sword is a bad pattern sword.

19479. Some people say that the Anglo-Saxon will not point?—It is a question of training.

19480. You think he could be taught to do so?—Oh, yes. When I was in India Sir George Greaves, then Commander-in-Chief in Bombay, gave me this question of sword versus lance to consider. Many regiments were wanting to be armed as Lancers, and they gave me papers from the Record Office at Simla, amongst which were records of men who in the Sikh War had been accustomed to use the sword objecting very strongly to being armed with the lance, and I think the evidence all went to prove that whatever you taught a man to use, that weapon he would prefer.

19481. And to give him that training you say, further on in your paper, that he must be taught to move about the country more than he does at present?—Yes.

19482. Is that practicable in this country?—I think it is practicable if you do not take him up for trespassing; if you passed a proper Manoeuvres Act you could train cavalry thoroughly in England.

19483. You sum up your views about training in the last three paragraphs of your paper; do you want to expand that in any way?—No, I do not think so.

19484. (*Sir George Taubman-Goldie.*) How long would you say it takes to make an average recruit a good cavalry soldier?—A good cavalry soldier?

19485. A good average cavalry soldier?—I take it that in four months you ought to train him sufficiently to ride in the ranks; he is then able to charge, but I do not think he will have the intellectual knowledge to fit him to go on service. I think that in a year's time he ought to be quite fit to take the field, but his scouting would be at fault.

19486. When would he be fit for that?—I do not think under three years.

19487. What are the qualities he would learn between the four months you speak of first and the year?—He has got to shoot, and scout; he is but an indifferent horseman in four months.

19488. And in eight months more he would be an average shot?—Yes; that is if we give up a good deal of that *haute école* riding which we have done in the past—there must be less riding in the Riding House. The Riding School has come to be looked upon rather as the end in view than as the means to an end. There are only six things you want to teach the individual man in riding—to start his horse, to stop his horse, to back, to turn to the right and left, to circle to the right and left, and passage, and if he can do those six things he is quite fit to go into the ranks, and you ought to be able to teach him those six things in four months.

19489. And by a year he would be a fair soldier, in your opinion?—I think he ought to be a fair soldier, but not able to go out on his own responsibility.

19490. That you would not get in less than three years?—I think for a mounted man you must train him for three years, taking the average intelligence of the recruit.

19491. (*Sir Frederick Darley.*) Taking the average sergeant, would it take three years before he would be efficient, rising from the ranks?—It is the same thing.

19492. Can you safely promote a man to be a sergeant before he has been three years in the regiment?—No, I think he ought to have three years' experience before he is a sergeant.

19493. (*Lord Stratheona and Mount Royal.*) You say that the horses provided at Kroonstadt were of inferior quality; were they South African horses or from South America?—The South American horses were bad, undoubtedly; at the commencement there were a few of

Colonel
D. Haig,
C.B., A.D.C.

18 Mar. 1903.

Argentines of a different class, but when we got the great bulk of Argentines over later in the campaign, they were so very underbred, and so very slow, that they were quite unfit for the work of mounted troops.

19494. Were those you received chiefly Argentine horses?—I can find out what the class of them were.

19495. You say that although inferior those received afterwards were still worse—the Hungarian horses?—Yes, the Hungarians were a bad lot, but not worse than the Argentines.

19496. They were very bad?—Those I saw; I had a Hungarian myself, but I think it was an exceptional one, which I rode all the way through, and many people who saw him would not believe he was a Hungarian. That shows there are some Hungarians that are good.

19497. (*Viscount Esher.*) You do not favour taking the regimental signallers to form a corps of signallers?—No.

19498. What is the plan exactly which you would suggest?—I think we ought to have a corps of army signallers just like the department of telegraphs.

19499. What is the objection to the present system?—Because when we go away on service regiments are deprived of their best regimental signallers. Every brigade ought to have a proportion of trained signallers organised as part of the Brigade Staff.

19500. (*Sir Frederick Darley.*) Mounted men?—Yes.

19501. (*Viscount Esher.*) So that you are left without the few trained signallers you have got in your regiment?—Yes, and similarly with orderlies; there are so many men required on service for all sorts of odd jobs that it reduces the strength of squadrons very much. I think a corps of orderlies should be maintained in peace time.

19502. With regard to the mounted infantry, you do not object to mounted infantry?—No, but I think that given the fact that the amount of money to be spent on mounted troops is limited, those mounted troops ought to be cavalry. Cavalry can do every thing which mounted infantry can do, and other duties in addition.

19503. Your objection then is to a regular corps of mounted infantry rather than to the training of infantry soldiers as infantry on horseback?—The objection again to the mounted infantryman is that you take away the picked men from the infantry, so that the residue is not so efficient, moreover it is difficult to get recruits for infantry; cavalry is always up to full strength.

19504. But do you see any objection to the present system as they are at present working it at Aldershot, which is to pass a certain number of infantry soldiers through a mounted course, because that is really what it comes to; do you see any particular objection to that?—I see this objection:—I do not think you will be able to keep them mounted in war. Supposing that you have say, 2,000 cavalry, and that with mounted infantry you have 4,000 mounted troops in the First Army Corps alone, it would be very much better if you had 4,000 cavalry, as their horses will last longer, being professional riders, as against amateurs, so to speak. I think the requirements of those corps in remounts will be greater than you can supply in war.

19505. You think we are misapplying the lesson of the war?—I think so; I think what we want to do is to perfect the training of our cavalry, and I think we are wasting horses in training mounted infantry.

19506. The idea being that it is an advantage to increase the mobility of the infantry, you think that a dream, owing to the impossibility of providing in the first place a sufficient number of horses, and in the second place feeding them; is that your point?—That is one reason against it, that is one of my points, but my chief point is that in the field the mounted infantry is not so effective as cavalry.

19507. I do not know that that would be contended, but would you say that mounted infantry were not so effective as infantry who were not mounted? That is the way in which I think it might be put?—Well, but it comes back to pounds, shillings, and pence; if you cannot afford to feed these horses in war, what is the good of keeping them up in peace time? Take the situation that in open country there is a mounted enemy against you—cavalry—then success or failure in that open country depends on the number of men you can put into the charge, the mounted infantry cob that cannot charge is a useless mouth as compared with the cavalry horse. The thing is to be strongest at the decisive point, and the decisive point there is the charge,

and, therefore, I argue that mounted infantry is a very expensive luxury, as it can only suffice in special cases.

19508. I see that, but on the other hand, supposing you were now responsible for the training of the infantry, putting all your cavalry experience and your cavalry predilections on one side for the moment?—But I had mounted infantry experience, too.

19509. Well, I will say, putting your cavalry predilections on one side, would you, if you were responsible for the training of the infantry at the present moment, stop them absolutely from passing these men through a mounted infantry course?—Yes, I would. I think they are wasting their time, and I believe that if the cavalry men, when the carbine was started, had gone in heart and soul, and trained their men to use the carbine properly, we would never have heard of mounted infantry.

19510. I suppose there is no objection at any rate to a few men in every infantry regiment being taught to ride for the purposes, scouting, signalling, and so on; I suppose that would be useful?—I think mounted infantry cannot scout. It takes years to train a good scout.

19511. But infantry soldiers, at least a great many infantry soldiers, in a battalion are trained to scouting?—That is a sort of blindman's dog business, but that is not scouting on an extended scale.

19512. Would not that man be more usefully posted in certain fields of operations if he could ride?—Then comes in the question of horse management; you cannot teach a man really to look after his horse unless he is always with horses.

19513. I see your point is that you wish to keep the two services absolutely distinct?—Yes, and I think if you do start mounted infantry it ought to be on an emergency, and they should be mounted upon any kind of animal which you do not mind abandoning.

19514. For the purposes of such a campaign as this last one, for instance?—Yes.

19515. You hold that it is unnecessary to train men as mounted infantry in time of peace?—I think so. My point is that all money which is available for mounted troops should be spent on the cavalry.

19516. As regards the lance and sabre regiments, which you say should be in equal proportions to the other arms, the latter has been abolished?—Yes.

19517. That you think is a mistake?—Yes.

19518. Against uncivilised people the lance has been found very useful?—The reason I say the lance is better is that it is so much easier to teach a man to thrust with a lance; I grant you it is an inconvenience to have the very long lance they have now, and I think a compromise might be arrived at between the thrusting sword and this very long lance we have now; you could have a shorter lance with a counterpoise like a hog spear.

19519. In your Appendix B (see page 405), with regard to the proposal for training the cavalry men as scouts, in the first paragraph you say: "Twelve non-commissioned officers or men per squadron possessing exceptional intelligence, courage, nerve, and eye for country, besides being good riders and horsemasters, to be specially trained in each squadron." Is there anything to prevent the officer commanding the 17th Lancers from training twelve non-commissioned officers or men per squadron in the way you suggest?—No, but it is only a question of the pay. This Appendix B was really a scheme I drew out for the 17th Lancers before we left South Africa; the regiment was going to remain out there, and we were working on this plan to improve our scouting.

19520. But there is nothing to prevent the Colonel commanding any regiment you like to name from carrying out this?—Nothing, except that the pay: I propose to give them higher pay.

19521. That, of course, you cannot do, without authority, but I suppose something could be done in the way of training them?—And is being done in training scouts; in Scotland now we are working at it.

19522. (*Sir Frederick Darley.*) With respect to the lance, I suppose you have studied that charge of the 21st Lancers at Omdurman?—I was at Omdurman myself; I was with the Egyptian cavalry.

19523. Not in the 21st Lancers charge?—No.

19524. Have you heard that in that charge they did very little mischief to the enemy?—Because they charged over a donga, and many horses jumped over the enemy who were in this dry water course. I do not know what was the actual damage they did do.

19525. I have heard that it consisted of three men killed?—There were more than that; I think that is not quite fair; there were a good many more than three men killed. I went over the ground afterwards, and there were a good many more corpses than that on the ground; I went over the place a week afterwards.

19526. You mean where the Lancers charged?—Yes, the Egyptian cavalry went on pursuing the Khalifa. When we came back, I was in Omdurman for about a month, and we used to ride out over where the battle took place.

19527. You have been asked with reference to using the rifle with a bayonet as a lance; would there not be a danger, supposing there was a charge home, of losing the rifle?—I think so, and also of damaging it.

19528. But of losing it if it was used?—Yes.

19529. The lance is attached to the arm by a loop?—Yes.

19530. So that a man may let a lance go, and then draw it back, but with the rifle, if you let that go it is gone?—Yes, but they might attach the rifle with a sling, and I think that might get over that point, but it is the weight I think that makes it so unhandy.

19531. (Sir John Edge.) You would have to take the rifle about half way up the barrel?—Yes.

19532. You could not ride at a man holding it by the grip?—No.

19533. (Sir Frederick Darley.) You speak here of a Colonial ambulance; do you remember what ambulance you saw?—It was from Sydney, New South Wales, and a most excellent one it was. General French and I rode in it over rough ground for about a quarter of an hour to test it, and it was a very good ambulance.

19534. Do you remember the name of the officer who was in charge—Colonel Williams?—I have forgotten for the moment.

19535. Or Fiaschi?—It was under Fiaschi.

19536. Williams was the officer in charge?—We had several detachments of medical corps. I cannot find the name in the diary, but talking about the lances, I see that on the 27th October an urgent wire was sent to Pretoria for 300 swords and 500 lances, "as owing to the wear and tear many have become unserviceable, and in the present condition of the enemy an attack with the sword or lance is more demoralising." That was on the 27th October, 1900, before the Field-Marshal came home.

19537. You knew Dr. Fiaschi?—Yes, a first-rate fellow.

19538. And you approved of the ambulance?—I am not a doctor, but they struck one as being well equipped.

19539. Were you at Diamond Hill?—On the north part; it is called Diamond Hill, and I was with the cavalry on the north that day.

19540. Were there any New South Wales mounted troops with you there?—Can you recollect the date?

19541. I cannot recollect the date, but I think it was some time in October; there was a cavalry charge that

went home?—That was further south; that was not in General French's command on that day.

19542. That charge went home; the Boers waited for them?—Yes, that was where Lord Airlie was killed.

19543. If there had been reliable mounted troops like trained cavalry, even one squadron, with Lord Methuen at the time of that reverse, do you believe that reverse would have taken place?—Of course, I do not know enough about the facts of the case, but personally I believe if there had been any troops mounted with the sword or lance that the Boers would not have dared to charge home.

19544. Do you believe that the Boers would have charged in at all if there had been men there to meet the charge?—I have General Smuts' statement that they would not; he said that if they got up to within 200 yards of a position they always counted it as captured, but that they would not dare to do such a thing if there were cavalry there to charge them.

19545. (Lord Strathcona and Mount Royal.) You speak of the over-sea Colonials, and say they were good horsemen, but that they lacked trained officers—there not being a sufficient number of Imperial officers; you do not wish it to be inferred that they were not capable of doing good service, and that they did not do good service?—Not at all; they did extraordinarily good service, but what I want to say is that they asked for Imperial officers, and we were not able to give them; from the very commencement they were all wanting an Imperial adjutant just to help them.

19546. But the Colonial officers did good service?—They did right good service.

19547. Do you know of any particular occasion, or occasions, on which they were at a disadvantage in not having trained officers?—I take one at the very commencement which I have here; some over-sea Colonials near Arundel went forward towards the enemy's position without proper precautions, and they came back rather hurriedly; the officer did not know what he was about, as he had only just landed in South Africa.

19548. And you consider that it would have been better had they had more trained officers, as in all other regiments?—Yes.

19549. You recommend that the men enlisted should remain by their own regiments, and that the *esprit de corps* should be maintained and encouraged?—Yes.

19550. Now, as a matter of fact, in the territorial regiments, is it the case, if the county is Essex, for instance, that the men of the regiment come from that county especially?—I do not know enough about those territorial infantry regiments to tell you, but what I mean is that if a man joins a regiment he gets imbued with the old historical traditions that are prevalent in the regiment, and he fights all the better for them.

19551. He should not be transferred?—No.

19552. He takes an interest in that particular regiment?—Yes.

19553. Take the Highland regiments, do you know whether the men of those regiments are almost entirely Highlanders?—I am not in a Highland regiment, but I fancy there are a good many Highlanders in them; anyhow, they have got the traditions, and Englishmen joining get to believe they are Scotchmen. There is a little leaven of Highlanders that leavens the lot.

19554. (Chairman.) Is there anything you would like to add?—No.

Colonel FORBES MACBEAN, C.B., Commanding the 1st Battalion of the Gordon Highlanders, called and examined.

19555. (Chairman.) You are in command of the 1st Battalion of the Gordon Highlanders?—Yes.

19556. When did your battalion go to South Africa?—We landed at Cape Town on the 29th of November, 1899.

19557. You have been enough to give us a *précis* of the evidence you are willing to give, and I think, if you have no objection, we will put that in in the first instance, and you can develop any of the points as we go along?—Very good.

Précis.

Battalion embarked for South Africa; strength, 29 officers, 856 non-commissioned officers and men. Of these latter 500 were mobilised Reservists; of the officers, all but five had previous war service.

Of the men, over 600 had the previous experience of two campaigns—Chitral and Tirah.

General Physique and Morale.

Were excellent and all that could be desired; both qualities became more marked as the war went on. With the majority each man's aim appeared to be to do his utmost in his small way to bring the war to a successful issue, and to maintain the reputation of his regiment. In the most critical situations I invariably trusted the unconquerable spirit of the men under my command, a confidence shared by all my officers.

As a body the non-commissioned officers were magnificent.

Macbean, C.B.

Colonel
Forbes
Macbean, C.B.
18 Mar. 1903.

Intelligence.

Those men who had no previous war experience were at first wanting in this, and, as was perhaps only natural, did not know what was required of them, but they rapidly learnt from having experienced comrades to teach them.

Intrenching.

As regards this, my experience was that the men, unless at the advice of the officers, did not fully appreciate the value of hasty entrenchments; they certainly had no conception of the power of penetration of the bullets used against them, and appeared to think that a small mound of earth as a means of concealment was sufficient cover. They, however, very rapidly appreciated the necessity of excavating cover rapidly and on all occasions, and also the erection of sangars, which they learned during their Indian campaigns. In soft ground the regulation bayonet proved an excellent implement for digging.

Taking Cover.

My experience served to prove to me that the youngest soldier fully appreciated the value of this, and sought it instinctively and intelligently, after being a few minutes under fire.

I am of opinion that there is a danger of the teaching of recruits to take cover being overdone. It should only be sought when ordered by an officer. I consider it important that men should be trained how to reach and leave cover with least danger of being hit. The possibility of the old dash of the British soldier regardless of danger being lost, should be carefully guarded against.

Quality and Improvement.

Assuming that the quality of the men means fitness and aptitude for war, I consider the men under my command were possessed of all those qualities essential in a good infantry soldier, being confident and enduring under trying circumstances, and during the latter and more trying period of the war much good-humoured patience.

Future Training.

Although the system of training adopted in my battalion prior to the war proved all-sufficient to convince me that all ranks had acquired an intelligent and thoroughly practical knowledge of their profession, it must be remembered that their education was received in India and Ceylon, where facilities exist for the proper training of a soldier that are almost impossible at home.

The preparation of a battalion under home service conditions for active service is, except at one or two stations, next to an impossibility, freedom of movement, the most important factor, being almost unknown.

While quite aware of the great difficulties with which the authorities have to contend, I hold that giving a battalion month's exercise under canvas, or on manœuvre ground, is wholly inadequate training. Recruits and young soldiers are grounded in extended order work in all its many varieties on a barrack square, by which their ideas on the subject are as cramped as the space they work on, and these undeveloped notions they take with them to the larger ground when opportunity occurs, and it is essentially a part of the soldier's preparation for war that cannot be taught theoretically.

The system of training as laid down in the new "Infantry Training" is all-sufficient, provided officers are afforded the chance of teaching their men on ground adapted to the work.

Eyesight.

I wish to mention that I was on many occasions struck with the excellent eyesight of the men, and that their capabilities and power of observation increased very much during the course of the campaign.

Deaths from Disease.

As regards sickness, 37 died of disease; of these 25 were enteric cases, but as far as I can trace not more than one officer and six men contracted it while with the battalion.

Arms.

The arms were found to be very efficient, with the exception of the magazine, which could not always be relied on, owing to the jamming of the platform.

Clothing.

The thick felt hat was more suitable than the helmet, being lighter and allowing more freedom for the head when firing.

The new service jacket (drab mixture) most suitable for both hot and cold weather.

Kilt by far the best thing to march in.

Khaki canvas gaiters with foot-straps made of some strong material preferable; the drill khaki ones with buff straps which were issued only lasted a short time.

The great coat was found to be more an encumbrance than a comfort. It is only worn in wet weather (on the march), and after being soaked only adds to the discomfort and weight carried by the soldier, making him quite unfit to move rapidly before the enemy, and great difficulty is found in taking aim when clothed in wet great coat and accoutred.

Would suggest a strong light waterproof cape, similar to that supplied to the cavalry in South Africa, which could be thrown back clear of the arms on coming into action, and, if circumstances permitted, could be taken off, rolled up, and fastened to a belt behind in a very short space of time. When not required it could be carried strapped to the waist-belt, and if rain came on could easily be undone and put on. In cold weather the addition of a "British warm" coat should be sufficient for night work.

Shoes.

The shoes issued at the beginning of the campaign were very good, but later were of a very inferior quality, and seldom lasted more than a month or six weeks. The Indian-made were especially bad, the soles and heels giving way from the uppers, allowing the sand to get to the feet, and knocking the men up. As a rule these shoes were made too high at the ankle, and to prevent the skinning or blistering of the ankles, had to be cut down. In one or two cases "British makes" were also very poor, and had every appearance of being hurriedly "made up." All shoes as a rule were made too tight at instep, and had to be cut to give sufficient space and ease. The arrangements for provision of clothing to the Army by Royal Army Commissariat Department were excellent.

Necessaries.

Necessaries were too often issued on payment, at times when I think the men should have got them free. Even on, or after being on, trek, when necessaries were thoroughly worn out, if demanded from Ordnance, payment had to be made for issues.

Accoutrements.

The present accoutrements are cumbersome, heavy, and badly balanced, and ammunition was continually lost by falling out of the pouches. Would suggest two light bandoliers, one on each shoulder, and holding 50 rounds of ammunition each. A bandolier waist-belt, with frog attached, to hold 50 rounds (25 rounds on each side of front of the body); this would hold the 50 rounds issued before going into action, and would make a total of 150 rounds on the men.

Mess tins.—The cavalry pattern is preferable to the pattern issued to infantry at present. Mess tins were carried in the haversack, after experimenting, and the infantry pattern, originally intended to be placed on top of valise or great coat, was found to be of an awkward shape, and not so handy as the cavalry one.

Water bottles.—I think the aluminium water bottles, felt covered, and Indian pattern (holding three pints) are much the best.

Blankets and Waterproof Sheet.

As the present waterproof sheet is not much use for keeping out the damp after being a short time in use, I think that instead of one of the blankets and waterproof sheet now issued, one blanket-lined waterproof with pocket at end should be issued, the waterproof part to be made of thicker material than the present waterproof sheet, which cracks and admits damp in a short time—Wilkesden canvas would be suitable—three eyelets could be inserted on each edge to be used for bivouac when necessary.

Food.

The supply of food was, under the circumstances, very good, but I think that more attention could have been paid to what might appear to be of little consequence. Salt, for instance, was generally scarce at the beginning of the campaign, and was a most necessary article at that time. Again, tea, which I have great faith in as a stimulant, was very often reduced to half ration (12 men to one ounce), when to have given the men a full ration would not have taken much more transport and would have added greatly to the comfort and spirits of the men.

Ammunition.

I have always found the supply of ammunition to be equal to any demands made.

19558. You came from home, did you?—Yes.

19559. And, therefore, a large proportion of your battalion were reservists at that time?—Yes, they were.

19560. When you say that over 600 had previous experience of two campaigns, was that mostly among the reservists?—In the large majority.

19561. How many men did you leave at home when you took out the 500 reservists—recruits and under age?—It is hard to say; that is not a point I looked up before I left, and I would not like to state the number without being certain.

19562. But a considerable number?—A considerable number, and certainly not less than 150; I could easily find out.

19563. I do not think I need take you through this in detail; your opinion of your men was that they did excellently?—Yes.

19564. And that the reservists in particular did so?—Yes, they turned out very good.

19565. You think that perhaps there is too much said about teaching the recruit to take cover?—Yes. I think it is a thing that is inclined to be overdone.

19566. He does it naturally enough?—He does it naturally enough if he has been under fire once or twice, and, of course, as we were situated with the number of old soldiers we had, they very soon saw that any youngsters near them got under cover.

19567. You do not want them to lose the dash?—No.

19568. I suppose there was no sign of that during this campaign?—No, I never saw any sign of it.

19569. You say that: "Assuming that the quality of the men means fitness and aptitude for war I consider the men under my command were possessed of all those qualities essential in a good infantry soldier." Does that mean that you are satisfied with the class from which you recruit at the present moment?—Yes, thoroughly.

19570. Because a good deal has been said as to the class of recruit—that if we could get a more intelligent class we should have a better soldier. Is that your opinion?—Well, we are getting at the present moment very much the same class of recruit we have had since I have known the Service, and, of course, we do our best always to get nothing but the Aberdeenshire country lad, and he is not naturally a man gifted with intelligence, he has to be taught it.

19571. But given opportunities of training he has enough intelligence in him to profit by it?—Yes, I certainly would not consider him a thoroughly good soldier, under two years' or two and a-half years' service. He takes a great deal of training and teaching, he is very slow, but when he once learns he does not forget.

19572. Do you manage to get a large proportion of those country lads?—Yes, a very fair proportion; we are doing pretty well now.

19573. Is that the effect of the prestige of the war, or had you had any difficulty formerly?—No, I think any fillip that was given to recruiting on account of the war has disappeared; I think the country people have now begun to forget it, and I do not think they are joining the regiment now on account of the war for all that has been talked and written about it. I think they are now joining in our own district because they wish to be soldiers.

19574. (Lord Strathcona and Mount Royal.) Were the men chiefly from the east coast of Scotland?—No; we do not get any coastmen; the Aberdeenshire fishermen will not enlist with us at all.

19575. (Chairman.) But they are mostly Aberdeenshire men?—A large percentage of them are; on the 1st January last I had 82 per cent. of Scotchmen in the battalion.

19576. And the rest?—A few Englishmen and fewer Irishmen.

19577. Would these Englishmen and Irishmen be men who were enlisted in Scotland also?—Yes, they might have been, or they might have enlisted in London at the time when we were open for general recruiting. When we do get Englishmen we generally get men from Northumberland and Yorkshire, and a few from London.

19578. What do you mean by being open for general recruiting?—If we are very much below our numbers; at present we are only open in our own district.

19579. And if you get short of numbers you can go outside your district?—Yes. 18 Mar. 1903.

19580. Does that often happen?—No.

19581. As for the training of the men, the difficulty that you see is chiefly in the facilities for getting the proper training?—Yes.

19582. Does not that exist in this country?—Well, I take it that Aldershot, and perhaps York and Salisbury are the three chief training grounds. I have no experience of any of them myself, but in my present station at Glasgow we have absolutely nowhere where we can go to train the men beyond the barrack square.

19583. And there you cannot give them the training that is wanted in war?—No.

19584. What remedy can you suggest?—The only remedy is having ground to drill them on. I am afraid there is no remedy that can be applied at Glasgow.

19585. (Sir Frederick Darley.) Would it be possible to entrain the men and take them out to the country?—They are taken; they go for the musketry to Barry, and they do their military training there, but that is only for a month or six weeks in the year, and during the rest of the year they are being trained on the barrack square in Glasgow. If we had the ground to work the men over I am convinced that the training would be very much improved.

19586. (Chairman.) You think the system as laid down would be sufficient if you had the ground to work them on?—Yes, I think the system is quite as it should be; all we want is the opportunity to apply it.

19587. You mention the eyesight of the men, but you cannot very well train that unless you have larger areas of ground?—Quite so, and in several instances I noticed the wonderful eyesight the men had when they were on outpost duty on the look-out, or anything like that.

19588. And they improved during the war?—Yes; of course, as you know from the opening statement in my evidence, the majority of the men were men who had seen two previous campaigns, and their eyesight had been trained then.

19589. In such matters as judging distances and that sort of thing?—Not so much that, but they had noticed anything directly, which had not been there five minutes before; a man riding in the distance, or a cloud of dust, or anything of that nature, they were very sharp at.

19590. But for shooting under modern conditions the judging of distance is a great matter, is it not?—Quite so.

19591. How did your battalion come out in that respect?—As far as we could judge they shot very well.

19592. Have you formed any estimate of the comparison between your shooting and the Boers' shooting?—I should say it is quite as good.

19593. Was the Boer shooting good, in your opinion?—No; I think comparing it with our own it is of a fairly high average, and they have a certain percentage of men who are uncommonly good shots, but taking it all round, I do not think they are any better shots than my own battalion. During the whole of the advance I might say after the fight of Driefontein to Johannesburg we always had the Foreign Legion opposed to us; they were the people we were always fighting. We were not fighting Boers, and during that period I saw a great many more dead Germans, Russians, and Italians than Boers. I saw hardly any Boers.

19594. How do you account for that, that they did not take cover so well?—I do not think they were quite so good at taking cover; I would not like to say, but I do not fancy that the German or the Russian is such a good shot as the Boer. Later on we had more to do with the Boers, and I saw a great deal more of their shooting then; but it did not strike me that their shooting was anything very, very wonderful.

19595. Was it better at long ranges or at short ranges?—I think they are better shots at short ranges up to 600 yards, than at long ranges.

19596. A good many witnesses have said that it is difficult to tell what the effect of our fire was, because you so seldom had a target?—Yes.

19597. And the Boers had a better target, as you were advancing?—Yes. Whenever possible they would always be behind rocks on a kopje.

Colonel
Forbes
Macbean, C.B.

Colonel
Forbes
Macbean, C.B.

18 Mar. 1903.

19598. Still, in spite of that, that is your judgment of the shooting—that our shooting was not inferior to the shooting of the Boers?—Certainly not inferior.

19599. And as to your arms, did the rifle compare well with the Mauser?—Well, I never fired with the Mauser, but the rifle that we had out there was a very good one, and I had no complaints against it; in this statement here I say that the rifle could not always be relied on owing to the jamming of the platform, but that occurred very, very seldom. It was a very good rifle indeed.

19600. And as to the sighting, we have heard something about that?—We had no cause of complaint at all.

19601. You prefer the hat to the helmet?—I think it is a more practical headdress; it does not look so well, but in wet weather it keeps the rain off a man's neck, and when you are lying down shooting it is much more comfortable and convenient.

19602. And the helmet sometimes gets in the way?—If you put the head back when you are shooting lying down you have to put the helmet back from over the eyes.

19603. (*Lord Strathcona and Mount Royal.*) And the soft hat serves as a pillow to a certain extent, does it not?—The helmet is a better pillow than the soft hat.

19604. (*Chairman.*) The great coat you found in the way?—Yes, the great coat was not a success.

19605. It was too heavy?—It is too heavy, especially when it is wet.

19606. We also heard that it was rather inconvenient in forming a mark for the enemy?—Yes, especially in the early morning; on a misty morning on outpost duty I always made the men take off their great coats directly it got light, because you could see a man standing up, or whatever position he was in, directly some considerable distance off, if he had a dark great coat on.

19607. One suggestion was that the great coats should be carried in a cart close behind the men instead of their carrying them themselves; you would prefer to do away with it altogether?—I would prefer to have it done away with altogether. When there was transport available we did carry our great coats in carts.

19608. But it was not a part of the general system?—No.

19609. And even if it was made so you would prefer to have this waterproof cape?—Yes.

19610. With a coat for warmth?—Yes, one of the coats called the "British warm" coat.

19611. Could a man carry both that coat and the cape himself?—I think it would be quite sufficient if he carried one of them.

19612. And the other would have to be carried for them?—The other would be carried in a cart or wagon.

19613. (*Lord Strathcona and Mount Royal.*) What is the difference between the great coat and the "British warm" coat?—The "British warm" coat is the coat that is always issued in India, and used in the frontier expeditions there; it is made of a rough, thickish khaki serge, lined with grey flannel, single-breasted, and is an excellent coat.

19614. And much lighter than the great coat?—Very much lighter. It is not longer than an ordinary pilot jacket sort of coat, and it is a great favourite.

19615. (*Chairman.*) You had some bad shoes?—Yes.

19616. Particularly those from India?—Yes, they did not last.

19617. Had you used them before in India?—Yes.

19618. Were they different from the make you had there?—No, I think they were just the same; the Cawnpore shoe, most of them, I fancy.

19619. Were complaints made of them in India when you used them before in India?—That I could not say. I think the chief thing that ruined the shoes, especially in the early part of the war, was the marching early in the morning through the very wet grass, the leather seemed to get so very, very soft, and then with the constant kicking of a man's foot against the scrub and stones the toe went very soon, and they often went at the heel, and then the sand got in.

19620. I meant to ask whether it was a general objection you were taking to the shoes made in India, or

whether it was on this special occasion?—It was on this occasion only.

19621. You cannot say that there was any difference in the make you received from those you had had previously in India?—No, I could not say that.

19622. (*Sir Frederick Darley.*) Was it a shoe or an ankle boot?—A shoe.

19623. (*Chairman.*) Do your men always wear shoes?—Always.

19624. And the make apparently was not satisfactory?—It was not satisfactory.

19625. Is that an Indian shoe or a British shoe also?—Well, they both seemed to be too roughly made up; it refers to both of them.

19626. I suppose these were all hand-sewn shoes?—That I could not say.

19627. I ask the question because we were told that one of the reasons why shoes were got from India was that there was a difficulty in getting hand-sewn shoes. Is it the case that the men even on trek have to pay for their necessities?—Yes.

19628. How is that carried out? Is an account kept against each man?—Yes, the colour sergeant keeps an account against the men; the quartermaster finds out what necessities are required by the battalion, and indents for them, and then the individuals are charged.

19629. What necessities do you refer to?—Boots, spats, socks, shirts, mess-tins, and helmets principally. I have a copy of a charge that was sent in against us for necessities after we arrived at Bloemfontein with Lord Roberts, and those are the articles specified that we drew.

19630. (*Sir John Edge.*) If a man wears out his shoes or his boots in campaigning over rough country sooner than he would on a barrack square, has he got to pay for the new shoes or boots?—Yes.

19631. (*Lord Strathcona and Mount Royal.*) They must pay for their shoes?—Yes, the men are charged for them.

19632. (*Chairman.*) Is it an individual matter, that is to say, if half the men of a company have worn out their shoes, and the other half have not, is it charged against each individual?—Yes, the man that gets a pair of shoes is charged for them.

19633. That must mean a great deal of accounting?—It does especially on active service.

19634. (*Sir Frederick Darley.*) Who keeps those accounts?—The officer commanding the company and the colour sergeant.

19635. (*Lord Strathcona and Mount Royal.*) How many pairs of shoes or boots is a man allowed by the Government in the 12 months?—On active service?

19636. Yes, without paying for them?—When we started the campaign every man had one pair of shoes on his feet, and a second pair in his kit; but when we started for Bloemfontein we had to leave the second pair of shoes behind, because there was not sufficient transport to carry them, so that a man started with the shoes he stood up in, the best shoes he had, and those shoes lasted the men until they got to Bloemfontein, but after that, from then onwards, shoes were drawn as they were required. There was no actual allowance made.

19637. (*Chairman.*) Does a man receive so many shoes a year?—Not on active service.

19638. In peace time?—Yes, in peace time he does.

19639. (*Sir John Edge.*) So many shoes a year free?—Yes.

19640. Is there no issue of shoes free on active service?—Well, there was not until January, 1902, but from that date necessities were replaced if the commanding officer certified that they were worn out through fair wear and tear.

19641. Then you got a free issue?—Yes, if I certified that the articles indented for were worn out through fair wear and tear they were supplied free.

19642. (*Sir George Taubman-Goldie.*) So that during the years 1900 and 1901 the men were actually worse off pecuniarily, being on active service than they would have been during peace?—Yes, they were worse off from the money point of view.

19643. (*Sir Frederick Darley.*) Did they have to pay

Colonel
Forbes
Macbean, C.B.
18 Mar. 1903.

for a tunic too?—They had no tunics out there; only the khaki jackets.

19644. Had they to buy their khaki jackets?—No, only the necessaries.

19645. (*Sir George Taubman-Goldie.*) Do you mean that the peace allowance of shoes was not issued to them during active service?—I honestly could not say whether they were looked upon as a peace allowance, but from the time of our arrival at Bloemfontein onwards until January, 1902, the men were charged for necessaries.

19646. Without any allowance being made at all?—I never heard of any allowance.

19647. (*Sir John Hopkins.*) What are they allowed in peace time—two pairs a year?—Two pairs a year.

19648. (*Chairman.*) Surely they must have had those two pairs given them during 1900 and 1901?—I am not aware of it.

19649. You would probably have known if there had been a free issue of shoes?—I should have heard of it at the time, but I cannot remember at the present moment any free issue taking place prior to January, 1902.

19650. Could you ascertain?—Yes, I will ascertain, and let you know.

19651. (*Sir John Edge.*) Would not your adjutant report to you if the usual free issue was not made?—Yes, the quartermaster would.

19652. And you do not remember getting a report of that kind?—Well, there are so many things to remember that it is rather hard to remember a little item like that.

19653. I thoroughly understand that, but you do not remember having a report that no free issue was made?—No, I cannot remember at this present moment. I may say that a charge was sent in for these necessaries I am talking about at Bloemfontein, and they have not been paid for yet, so that I have no doubt the payment will be allowed to lapse, and that that will constitute them a free issue.

19654. (*Sir Frederick Darley.*) Has it been stopped out of the men's wages already?—No, and therefore that would make it so very difficult to recover the money now, because the men have gone to the reserve, and they have died, and I am afraid we could not get the money now even if we were told to.

19655. (*Sir George Taubman-Goldie.*) But any shoes they drew between the time you reached Bloemfontein, and January, 1902, were stopped out of their pay?—Yes.

19656. (*Sir Frederick Darley.*) Why are those things you have read out marked down as "necessaries" and not other articles of clothing?—I could not say why; they are laid down by Government as necessaries.

19657. And other articles of clothing are not?—That is so.

19658. (*Chairman.*) You said that a free issue could be made on a certificate by the commanding officer?—Yes.

19659. After a march like that to Bloemfontein, would the commanding officer not have been justified in asking for a free issue then?—No, I could not have done it then.

19660. Why?—Because I was not allowed by the clothing regulations.

19661. The regulation of January, 1902, was a new regulation?—Yes, in January, 1902, an order came out that the commanding officers could issue necessaries without payment if they certified that the articles required were worn out from fair wear and tear while on active service.

19662. And that order did not exist before?—No.

19663. So that at the time of the march to Bloemfontein you could not have certified?—I had not the authority to do it.

19664. (*Lord Strathcona and Mount Royal.*) Were two pairs of shoes in 12 months the allowance in peace time?—Yes.

19665. Even had those shoes been of good quality, which you say in the early part of the campaign they were not, would two pairs have been sufficient for the men for the work they had to do?—Do you mean during the march?

19666. In the 12 months?—No; I should say that two pairs would not have been sufficient; when we were on trek the life of a pair of shoes was looked on as 120 miles.

19667. And yet under any circumstances they would have had to pay for any additional shoes they required?—Yes, at that time.

19668. (*Chairman.*) The present accoutrements you think want improvement?—Yes, I think the present accoutrements are not very well balanced, and the pouch is not a good one for carrying ammunition in, it is so very liable to drop out and get lost.

19669. You prefer the bandolier?—Yes.

19670. Were the food supplies good?—Yes, except that at the beginning of the campaign the salt, which I think a very important thing, was issued short.

19671. Was that rectified afterwards?—Yes, later on we got ample.

19672. And as to tea, you think they had not as much as they should have had?—Yes, and the men are miserable if they do not have their tea; there is nothing they like so much.

19673. (*Lord Strathcona and Mount Royal.*) You look upon that as one of the best stimulants possible during service?—Yes, tea and sugar—sugar is a stimulant—not coffee.

19674. The tea can readily be carried at any rate?—Yes.

19675. But the sugar not so well, perhaps?—No, it is rather harder to carry it.

19676. (*Chairman.*) And of good ammunition you always had plenty?—Excellent; I do not remember any case of missfire—not one.

19677. Are there any other remarks founded on your experience that you would like to make?—With regard to the illness of the men, enteric; I think a great deal can be done to keep enteric away. Of course it means great care and great trouble, but if latrines are dug sufficiently deep, and also urinals, and they are properly filled in, and the drinking water is boiled, and especially the men prevented when on the line of march from filling their flasks wherever they like—if those sort of points are looked after to a great extent enteric fever is kept away from the men.

19678. Who has to look after them—the company officer?—Yes.

19679. Does he require any training in sanitation to enable him to do that work properly?—Well, they must know something about it, but as I say we were an old battalion who had been in India, and we knew all these things; we had practised them in India, and we reaped the benefit in South Africa.

19680. Your officers you think had sufficient knowledge?—Yes.

19681. And they were able to keep the men under control with regard to water supplies?—Yes, the men were very severely punished if they fell out and filled their water-bottles from any puddle or water-hole we came across.

19682. When you halted at night was the water supply taken possession of by an officer and regulated?—The first thing that happened was that there was a guard put over the water supply, and then it was drawn; the company cooks were the first people to fill the camp kettles, and after they had got it the water-carts were filled, and after that the beasts were watered; it depended on whether it was a water-hole or a stream, but there was always a guard over the camp water from the time we got to a place until we left it.

19683. And as much as possible was boiled?—As far as possible it was boiled; we were in a standing camp at Belfast for three months, and I got the General Officer Commanding there to make an extra issue of tea which we had boiled, and the men had it for their dinners in the middle of the day to make them drink boiled water.

19684. (*Lord Strathcona and Mount Royal.*) Besides fighting bravely, you say your men marched well?—Yes.

19685. And this you attribute to some extent to their wearing the kilt instead of the trousers?—Yes.

19686. The kilt is far better for marching than the trousers?—Yes.

19687. You are entirely in favour of the kilt being retained?—Yes.

Colonel
Forbes
Macbean, C.B.
18 Mar. 1903.

19688. (*Sir George Taubman-Goldie.*) We have had a good deal of evidence as to the want of initiative shown by junior officers; had you any experience of that?—No, I cannot say I had, at any rate not in the early part of the war; latterly we got a great many very young officers, and they were rather inclined to be stupid, but they knew they had very good non-commissioned officers with them, and they would almost rather take an old colour-sergeant's opinion than develop one of their own. They learnt quickly.

19689. Have you thought out any system by which initiative could be inculcated in young officers better than at present? Is there any practical way of doing it?—One simply comes back to the facilities for training the men. If I had plenty of elbow room, and the country to send the men all over, I would tell a youngster to go away at such and such an hour, or to parade and go away and do such and such things, and he would be bound to learn then; he could not help himself. There are many ways of training these young officers and teaching them initiative if one had the opportunity.

19690. (*Sir John Hopkins.*) Your company officers, the captains of companies, habitually drill their men nowadays, do they not?—Yes.

19691. By order?—Yes.

19692. And that you consider the best system?—I do not make them drill the men at every parade, but the system we have gone on in my battalion, and which we have always gone on, is simply that the officer commanding the company is responsible for everything in that company to me, and, of course, if I see that the training of that company is not being done, generally speaking, in a manner I approve of, I find fault with it, but as long as I see everything going on correctly I let him alone. That is the system that has always been followed in my battalion.

19693. And under that system you think you get the best results?—Yes, I think, certainly.

19694. With regard to the payment of men in the field and elsewhere, do you find that the company officer has time to do it?—Yes; of course when we were trekking much the men did not want money, and they would rather the money was kept, but when we got into a standing camp, or went in from the outlying districts to the line, the men wanted their money and they got it, and in standing camp there was plenty of time to pay the men. I never found the slightest difficulty under that head.

19695-6. I ask this question with reference to another: Do you think the system would be improved regimentally if you had regimental paymasters as you used to have in the old days? He is simply there to issue cash to the officers commanding the companies?—No, to relieve the officer in command of the companies.

19697. (*Viscount Esher.*) He would be responsible for the pay sheets?—And he keeps all the company's cash accounts, and the captain practically has very little to do with the payment of his company.

19698. And the pay sergeant would also be relieved?—Yes, I think that would be a very good thing; at present I think the pay sergeant has too much of his time taken up with the preparation of accounts, ledger work and clerking work, and he has no time to be in and out and about his company rooms looking after all these sort of things, and the recruits require so much looking after. The colour-sergeant is always in his bunk looking after accounts, and it would be the greatest blessing to the officer in command of the company to have the colour-sergeant more at his disposal.

19699. (*Sir John Hopkins.*) Did you see in South Africa both systems of transport—the regimental system which you started with, and afterwards the general system of transport, introduced by Lord Kitchener and Lord Roberts? You started with regimental transport?—Yes.

19700. And then it was made into general transport?—Yes.

19701. Your regimental transport system was taken away?—Yes, it was taken away and re-issued.

19702. As Colonel of a regiment, which of the two systems do you prefer?—May I ask the date when the regimental transport was withdrawn?

19703. (*Sir George Taubman-Goldie.*) In January, 1900?—I honestly had no experience of the regimental

system, because we never had any trekking prior to the departure of Lord Roberts from Graspan to Bloemfontein, and by that time it was general transport.

19704. (*Sir John Hopkins.*) If it is fair to go back to India, what did you do in India? Was your system there regimental or general?—When we started for Tirah we marched up country with regimental transport, and I do not know what happened afterwards; I was wounded, and did not go on.

19705. What is your opinion, as the Colonel of a regiment, of the transport regimentally? Is it a good system?—On active service?

19706. Yes?—No, I prefer to have it in general transport.

19707. (*Sir Frederick Darley.*) Is your regiment up to its full strength?—No, we have just sent a draft to India.

19708. How many companies have you now?—Eight companies in the battalion, four at Glasgow and four at Aberdeen.

19709. If you had a system of paymasters for the regiment, that would release 16 men—eight officers and eight non-commissioned officers—to their proper duty?—Yes.

19710. Have you many men taken away from you doing not strictly military duty in the barracks, such as cleaning up barracks, carrying coals, and so on?—No, we are rather well off in that way in Glasgow.

19711. How do you manage that?—I am commanding the troops there, and I do not allow the men to go.

19712. Who does the work?—Instead of having men always on fatigue work, I have one general fatigue on Fridav afternoons, and by that means I keep the men more with their company during the remainder of the week.

19713. So that they are able to drill better?—Yes.

19714. Would it not be possible to entrain, we will say, a company at a time, and send them some little distance out of Glasgow, as there is plenty of open ground in the vicinity of Glasgow where you could train the men?—There is really no place round about Glasgow.

19715. Within 20 miles of Glasgow there is surely open country?—Do you wish the companies to go in the morning and come back in the afternoon?

19716. Yes?—Honestly I do not know where the ground is.

19717. I know ground certainly within 25 miles of Glasgow—moors?—The company would have to be trained there and back, and that is an expense which I doubt if the Scottish District would meet.

19718. (*Sir John Edge.*) And you would have to get the consent of the owner of the moor?—Quite so. In Glasgow we cannot go off the high road; if a scout, or anybody like that, goes off the high road, there are complaints made, and I am written to at once.

19719. (*Sir Frederick Darley.*) Then Scotland is a bad training ground for troops?—Glasgow is.

19720. (*Viscount Esher.*) Terms would have to be arranged with certain landowners, but, so far as you know, no attempt has been made to come to terms with landowners within 20 miles of Glasgow?—From my own knowledge I cannot say.

19721. There is no want of training ground within 20 miles of Glasgow if terms were arranged?—Quite so.

19722. You know that as a fact?—Yes.

19723. Within half an hour by train?—Within half an hour by train I dare say ground could be got, but I cannot say where; I could not point out any place we could go to.

19724. (*Sir John Edge.*) I suppose a deer forest, for instance, would be an excellent training ground?—Yes.

19725. (*Viscount Esher.*) Is it satisfactory dividing your regiment into two and sending half of it to Aberdeen and half to Glasgow?—From the commanding officer's point of view it is not particularly satisfactory, because his one idea is to have his battalion together always, but Aberdeen is a very much better training place for the men than Glasgow is.

19726. How do you manage? Do you leave the same companies there month after month, or do you change them about?—They only went up last week, but I believe the idea is that the companies are to be there permanently.

19727. You mean that your half battalion will remain there for the summer altogether?—I fancy as long as the battalion remains with the headquarters in Glasgow. I have received no instructions whatever about it yet from Sir Archibald Hunter, but Aberdeen is a better training ground for soldiers than Glasgow, because there are links all along the seashore.

19728. You have seen suggestions probably in the newspapers that an Army Corps should be permanently located in South Africa in time of peace for the purpose of training?—No, I cannot say that I have seen it.

19729. Anyhow, that suggestion has been made. From what you saw of South Africa, do you think it would make a fine training ground in time of peace?—It would make an excellent training ground, but the country in South Africa is so different that the training the men would get in South Africa would not adapt them for fighting in Europe.

19730. That is the point I wanted to put to you; you do not feel confident that the training which you give to the Gordon Highlanders if they were quartered in

South Africa in time of peace would be of much material assistance to them if they came to fight a European enemy?—Oh, no; it is utterly dissimilar.

19731. How many years was your first battalion in India before you went to South Africa?—I cannot be certain, as I was not with the battalion. I was with the second battalion always until 1895, but at any rate the battalion left in 1881-82 and went to Malta, and then to Egypt and back to Malta, and did Mediterranean work, and then went out to Ceylon, I think, in 1891 or so.

19732. They were away 10 or 11 years or more?—Yes.

19733. One of the objections which has been taken to that idea of locating an Army Corps in South Africa is that it might interfere with the recruiting, but I suppose it would practically make no difference, and the men would not mind if they were quartered in South Africa or in India?—I do not see why it should interfere with the recruiting.

19734. (Chairman.) Is there anything else you wish to add?—No, I have nothing else to suggest.

Colonel
Forbes
Macbean, C.B.
18 Mar. 1903.

(After a short adjournment.)

Colonel E. M. S. CRABBE, C.B., called and examined.

19735. (Chairman.) You were in command of the 3rd Battalion of the Grenadier Guards?—Yes.

19736. And they went out with the First Army Corps, did they?—They went out with the First Division.

19737. You have been good enough to give us a précis of the evidence you proposed to give which perhaps it would be simplest to put in, and you can develop any point in connection with it?—Certainly.

Précis.

In accordance with the desire of the Commission expressed to me by their Secretary, I beg to offer the following *precis* of my evidence on the points mentioned in the Secretary's memorandum. I should, however, like to mention that from Christmas, 1900, to March, 1902, I was away from my battalion, commanding a mounted column in Cape Colony, principally composed for some months of Imperial Yeomanry and Colonials. I returned to my battalion for the months of March and April, while in May I was in command of some 3,000 infantry, covering 200 miles of blockhouse line, from Thebus to Stormberg, and thence south, nearly to Queenstown, and I was in this position when peace was proclaimed.

General Physique and Morale of the Men, and their Intelligence.

The 3rd Battalion Grenadier Guards, whom I had the honour to command, were a particularly fine body of men. They had been weeded out before going to Gibraltar, in September, 1899, and were further selected when under orders for South Africa, and joined by a draft of about 400 Reservists. The battalion thus composed was naturally exceptionally good material, the men were strong and healthy, and the leaven of Reservists brought up the average of the men, and gave them all confidence, as well as adding to their sense of discipline.

It may not be out of place here if I say a word or two on the subject of the Reservists. Whatever doubts there may have been as to the advantages of the short service system, those doubts must now be thoroughly dispelled, once and for ever, in the minds of all who have seen our Army in South Africa. The Reservists came up almost to a man, rejoined, and fell into their places with a readiness and a discipline which left little to be desired. They were the backbone of the battalion, they maintained its traditions, its discipline, and its fighting capabilities. The percentage of crime among them was very small indeed, they had not forgotten their duties, and their presence was in every way an advantage to the battalion.

On the other hand, the poorest material I had out there, was a draft of 600 who arrived early in 1902. They were nearly all young soldiers of comparatively poor physique, and with but little discipline.

The morale of the battalion was good, they were plucky, and keen soldiers with lots of dash, but thoroughly under discipline. They had, as a whole,

fair intelligence, while in some cases ability as section leaders was conspicuous. I should like here to say that after a considerable experience, both of disciplined and undisciplined troops, I believe that discipline is the mainstay of good troops, and however much we may shake out and expand our training, it must be founded on discipline if we mean to maintain the traditions of our Regular Army.

On arrival in South Africa our troops had not been greatly practised in taking cover individually, but they very soon fell into the ways of the war we were carrying on, and took opportunity of protecting themselves, both by using natural cover as well as hasty entrenchments. It must always be borne in mind that it is much easier to teach men to take cover, as a natural action, rather than to prevent their lingering too long in it, and of this our enemies gave us several instances. They could not be induced to leave their cover to attack, even when they had favourable opportunities.

Future Training.

I think the experience of the war teaches us that we want to give our junior officers initiative and responsibility. They have lots of pluck, and in many cases were fine leaders of men, through, of course, with no experience, while others only required a little of the experience which they could not fail to gain in South Africa to make them thoroughly efficient. As a whole, those who served under me were excellent, and I considered that I was thoroughly well served. Of course, if we can ingrain initiative and responsibility into our younger officers they will carry it on with them into the higher ranks, and thus a general improvement in the regimental officer will be attained, but I should like to make it thoroughly clear that I consider the material under me in the shape of young officers would have satisfied any commanding officer, and went far to ensure the success of the battalion.

The responsibility of young officers and section leaders will naturally be increased by the greater extension of the company in the field, due to the longer range and greater precision of modern firearms and smokeless powder; the more responsibility that can be devolved from the captain, first on to the subalterns as half-company leaders, and then on to the non-commissioned officers as section and sub-section leaders, the greater will be the intelligence and freedom shown by the company as a whole.

Arms.

The .303 Lee-Metford Rifle far exceeded the expectations formed of it by many military experts. It appeared to suffer but little from the sand, and instead of getting out of order its somewhat complicated mechanism withstood the alternate heat and cold, the rain and snow, satisfactorily as a single loader; but the magazine springs soon got weak, and often failed to feed up the cartridges properly. The excessive strain of nearly three years' hard work and constant firing told con-

Crabbe, C.B.

Colonel
E. M. S.
Crabbe, C.B.

18 Mar. 1903.

siderably on the grooves, but this might be expected with any rifled weapon, and, I believe, applies equally to field guns.

Clothing.

The supply of clothing and equipment sent from this country to South Africa appears to have been sufficient for the wants of the Army, and when units failed to receive necessary supplies the failure was due either to continuous marching away from the base, in the early part of the campaign, when the enemy were active against our lines of communication, or to rapid cross country marches, which prevented due warning being given to the ordnance to send to a particular station. The quality of the serge khaki was not as good as the corresponding drill.

Supplies.

Good and plentiful as far as the men were concerned, except between Kroonstadt and Pretoria, when there was an unavoidable shortage. The troops were distinctly better fed than in any previous campaign I have been in.

Transport.

At the commencement of the campaign each unit had its own regimental transport, in which it took great interest, and which was in a thoroughly efficient state. In February, 1900, Lord Kitchener changed the system and made a fresh organisation, by which the transport was all given to units on the march, and taken away from those at rest, and thus the regimental transport, except as regarded the first line, ceased to exist. Although this action was unpopular at the time, its results were far reaching, and the success with which a largely increased force was moved and fed, amply repaid any temporary inconvenience. Mule wagon transport is by far the most efficient to accompany troops. Ox transport is too slow, and can, or rather should, only move late and early, resting through the middle of the day, and this arrangement does not, as a rule, suit the movements of troops. If overworked, the oxen die rapidly. Mule pack transport is very valuable for small columns leaving the roads and traversing mountainous districts, but the number of animals required is much greater in proportion than when in draught, and sore backs are frequent. The obstacles surmounted by the mule wagons and the distance they travelled were truly astonishing.

19738. You were with your battalion for most of the time, I think, in South Africa, but not the whole?—I was with it for just over a year; then I was on column for a year and a quarter, and then I was with it again practically until I left South Africa in July, and during the last time I was with it it was to a great extent nominal—that is to say my second in command was actually in command, because I had a good many other troops under me at that time.

19739. In the first period what service did this battalion see then?—The battalion fought at Belmont, at Modder, Magersfontein, the march to Bloemfontein, including Poplar Grove and Dreifontein; then from Bloemfontein we went down south to Norvals Pont, but we did not see any fighting; we came back at once to Bloemfontein—we went down by train and came back by train. Then they went on the Dewetsdorp expedition, and back to Bloemfontein; then from Bloemfontein to Pretoria. From Pretoria we went to Diamond Hill; we then lay at Donkerhoek for a couple of months; from there we started off on trek to Komati Poort, which we reached on the 23rd of September, 1900. From there we came back at once to Pretoria, and were there for a month, making one small expedition; we saw no enemy, so that really it was of no importance. Then we went down to Springfontein, and remained there three weeks, after which we were sent to guard the drifts of the Orange River; the battalion remained guarding these drifts until De Wet entered the Colony for the first time, and then they were collected partly to me at Petrusville and partly to my second in command at Norvals Point. I then practically became column commander; I took part of the battalion and various other details that were with me.

19740. During the first part up to the taking of Pretoria is the period which comes before us. You were quite satisfied with the behaviour of the men in your battalion?—I consider I had an exceptionally good battalion, due very strongly to the Reservists who were with them.

19741. You think very highly of the Reservists?—I think very highly indeed of the Reservists.

19742. I think you put it that they were the backbone of the battalion?—Exactly so.

19743. Some witnesses have spoken of cases in which there were a very large proportion of Reservists in the battalion, and that there was some little difficulty at first until the men had re-accustomed themselves to the work. Did you see anything of that?—No, I found no difficulty whatever. I found them on board ship at Gibraltar, and when they landed at Cape Town every one of them was ready to take his place in the ranks as well as any other man.

19744. You mention, however, that there was, later in the war, a draft that came out with which you were not so well satisfied?—Yes.

19745. What service had those men?—Those men fulfilled the conditions of active service, which were one year's service in the ranks and 20 years of age, but beyond that, of course, they had done nothing; they had had a year's service, and that was all that could be said for them.

19746. But were they all 20 years of age?—I have every reason to believe so.

19747. I suppose that as a rule a man in the Guards who is 20 years of age and has had a year's service can be expected to be a man of pretty good physique and some discipline?—He should be a man of good physique and of very good discipline.

19748. Then how do you account for that draft being inferior in training?—The numbers at home under instruction with the home battalion, which only had the ordinary staff of a battalion, prevented the men receiving so thorough a training as they would have had under ordinary circumstances.

19749. The numbers of men then were in excess of the ordinary establishment?—Certainly. I am given to understand that there were over 3,000 men on the pay of the 1st Battalion Grenadier Guards at one time, and 2,500 were actually serving with the colours. This was the only battalion of the regiment which was at home.

19750. These soldiers of this draft of which you speak only arrived early in 1902?—They arrived in January, 1902.

19751. So that I suppose they did not do much service?—They did a great deal of blockhouse work; that was all that they did. They saw no fighting, except what fighting there was on the blockhouse lines—the taking of Kritzingers, and such like.

19752. So that your criticism of them is as regards the appearance of men, not as to any failure that took place in regard to them in South Africa?—My criticism of them is the result of my experience as a commanding officer.

19753. (Sir John Edge.) Your criticism of the draft?—Yes.

19754. (Chairman.) You mention here that you consider that discipline is the mainstay of good troops?—Most distinctly.

19755. And that therefore any system which did not provide for troops at the front coming out as disciplined troops would be unsatisfactory?—Most certainly.

19756. You speak of expanding the training; have you any suggestions to make with regard to that?—I think I have spoken of that future training further on.

19757. That was about officers, though, was it not?—Yes. It applies, I think, very much to officers and men. There is no doubt about it that our training now in the first instance must be on a great deal larger front than it used to be. We must instil intelligence into our sub-leaders. But before we can attempt to do anything of that kind I am perfectly certain that we must have the men disciplined. The idea of obtaining an Army full of intelligence alone does not commend itself to me. It must be an Army which has discipline and intelligence.

19758. But then to get discipline must you have the same sort of training and drill, and so on, as you have had in the past?—You must commence with the same barrack-square drill that we have now.

19759. In order to get the discipline which you think so essential?—Certainly.

19760. And then, having got the men disciplined, you

Colonel
E. M. S.
Crabbe, C.B.
18 Mar. 1903.

should cultivate their intelligence to enable them to act on their own initiative?—As much as possible.

19761. Can you do it in the time? What sort of time would you require to get a disciplined man, and then to cultivate his intelligence?—You ought to get a very good disciplined man in a year, and with a certain amount of intelligence thrown in. I do not think that you want men who will always rush to the first bit of cover that they see, and there stick. You may notice I have spoken of that in my *précis*. It is exceedingly easy to teach men to take cover, but it is not always so easy to get them out of it. Nobody suffered from that more than the Boers did. They would go into a position, and no power on earth would get them out of it; I mean to advance against us. I put down one or two instances where they might very easily have created great havoc. There was one at Magersfontein. If, when we retired from Magersfontein the Boers had chosen to rush out of their entrenchments and get on to some rising ground, which we had, of course, to vacate as we retired, they would have given us a bad time going back; and they would have been able to get back into their entrenchments if we had made a counter attack, which we should have done, without any difficulty, and they could have inflicted very severe loss. But they were in their trenches, and out of their trenches they would not come. At another time when I was with the column they were very clever; they let my scouts go through them, and then held my scouts. I, having seen them go over the hill and go straight on, of course, thought everything was all right; the scouts did not come back; I thought they were just over the brow of the hill. My advanced guard followed, were close up to the hill, and were met with very heavy fire. If, added to that, the Boers had charged them, I think I should have been in a very awkward place; as a matter of fact, my men formed up and made a flank attack, and in the evening, with 150 men, I had moved out between 400 and 500 Boers. That only shows that it is very difficult indeed, when you have your men safe behind cover, to get them to go out of it into the open to attack the enemy. That last incident was near Steynsburg, in May, 1901.

19762. Your speaking of these incidents leads me to ask you what do you think about the shooting of the Boers?—The shooting of the Boers was good with a small number, but indifferent with a large number. They had a certain number of picked shots who were very good indeed, but the numbers were not nearly on a parallel with the numbers of the men that they brought into the firing line.

19763. How would they compare, then, with the shooting on our side?—I think the shooting of the minority of the Boers was distinctly better than ours, but I do not think that the shooting of the majority of the Boers was any better than ours.

19764. Had we any picked shots to compare with the Boers?—No, we had not adopted the sharpshooting system; that is to say, we had not any particularly picked scouts to go out on their own. I think that is a thing we ought to have.

19765. In the heavy fighting in Lord Methuen's advance for instance, was the Boer fire good on those occasions?—I was not present at the battle of Modder River myself; I was down at Cape Town at the time, wounded, but from what I heard, at the battle of Modder River the Boer fire was not any better than it should have been. If it had been really very good, I think they would have inflicted a great deal more damage on us. And in the battle of Belmont, in the early hours of the morning, the Boer firing was very wild indeed.

19766. Was that in consequence of our fire?—I hardly know. But when the Boer fire first broke out all along the ridge it was, of course, a weak light, and I think that had a great deal to do with it. As the light improved I daresay their fire might have improved, but by the time that the light had got really good we had got on to the top, and the Boers were on the move. They took up other positions afterwards, and I do not know what they did, because I was wounded at the top of the first position.

19767. Then were you not present at Magersfontein?—Yes, I was back at Magersfontein.

19768. What was the case there?—It is the custom on active service always that in a brigade each battalion leads in turn each day, and it so happened that on that

day we were the third battalion, and therefore we were in reserve. The Scots Guards were sent away on to the left, and the two Coldstream battalions were employed in front. The two Coldstream battalions did very fine work, in fact, they saved the battle of Magersfontein; but we were in the rear and really had very little to do. I think I had only three casualties all the time.

19769. Have you reason to believe that the fire of the Boers was good on that occasion?—I have reason to believe it was very fair, very fair indeed. They were all entrenched. Their fire out in the open is not good.

19770. Why?—They want cover. They are all right when they have got it.

19771. (Sir John Edge.) They cannot shoot well, except from cover?—No only from cover.

19772. (Chairman.) And the rifle you think did well?—Our rifle I thought did remarkably well. I was very highly impressed with it. I have been connected with musketry for most of my soldiering, and I was very highly impressed with the results.

19773. We have heard something about some defective sighting. Did you come across anything of that kind?—No, I cannot say that I did.

19774. The clothing and supplies you were satisfied with?—Yes, I think that considering the exigencies of the campaign, there was nothing to complain of in the way in which we got our clothing, or in the quality of it. I have noted that at one time the serge was better than at another. And as regards supplies, undoubtedly they were a wonderful success.

19775. As regards transport, there was a change made on which there are two different opinions, I believe?—Yes.

19776. I understand that though you have a high opinion of regimental transport, you still think that the general transport system was the most effective for the circumstances?—Under the circumstances of the campaign, yes; but please do not take it as my opinion that regimental transport should always be done away with, and that general transport should take its place.

19777. I wanted to bring that out, because I was not quite sure?—No, only with regard to this special campaign in which we started, say, with 50,000 men, and had to expand our transport, which was very difficult to create, into sufficient for 200,000 men. Then the general system of taking all the transport away from any unit that was at rest for a short time, and giving it to the units that were going to move, acted most successfully.

19778. But is not that underlying the whole system of regimental transport; that it may be taken away at any time from a battalion that is in quarters?—Yes, that does underlie it to a certain extent, of course; but, on the other hand, supposing you are going to move, you require to have your transport in good condition, and that is not likely to be the case if you are dependent on what is sent back from other units which have just completed a march.

19779. Then I understand that to mean that for the general system of the Army you prefer to retain regimental transport?—Yes.

19780. With the ordinary arrangements for supply parks and supply columns?—Yes.

19781. Is there anything else you would like to add?—I do not think so. You have, of course, the conditions of service under which the men went out there; that you probably would have had from plenty of other people.

19782. Yes, we have had that?—Unless you want to hear anything about the column, I think for the battalion I have given you all the information I can.

19783. The column you commanded?—Yes.

19784. That was after Pretoria?—Yes.

19785. Of course, so far as the military operations are concerned that is outside our reference; but if there is any question with regard to your experience in command of the column it would be quite competent for us to go into that?—I did not know whether you were taking evidence on the subject of Yeomanry.

19786. Certainly?—I had a good many Yeomanry with me nearly the whole time.

19787. Certainly we shall be glad to hear you if you have anything to say on that point. Which Yeomanry was it?—With my first column I had some of the first Yeomanry, the 65th and the 71st; the 65th were the

Colonel
E. M. S.
Crabbe, C.B.
18 Mar. 1903.

Leicestershires, and the 71st the London Sharpshooters. They were both very fine bodies of men, and they were, for Yeomanry, very well disciplined. They were some of the first Yeomen that went out, and they were troops that any man might be very thankful to have; they were very valuable. Later on, with the second column, I got four companies practically straight out from England of the second Yeomanry; that is to say, they had been for, I think, three weeks at De Aar, fitting out and doing a little training, and the difference was very marked indeed. They were not the same class of man as the first Yeomanry; they were not the same class of officers as the first Yeomanry; they were absolutely ignorant of the rudiments of soldiering. They were the 99th, the 104th, the 105th, and the 111th.

19788. And did they improve?—They improved very much indeed. Some of them turned into very useful soldiers.

19789. Did you have them for some considerable time?—Yes, I had some of them for nine months.

19790. And by the end of that time they had become efficient?—By the end of that time they were quite useful. The 104th and the 105th both did me very good work on several occasions.

19791. And it was more the fact that they had come out without the necessary training than the class of man which was the cause of their being inferior to the first Yeomanry?—The class of man would never have come up to the class of man of the first Yeomanry.

19792. He did not know so much about horses?—He knew nothing about horses, as a rule, nothing at all, and he had not nearly so much intelligence as the first Yeomanry. From the first Yeomanry, you would get, in their own language (it was not military language), a pretty good idea of what they saw going on, and you would not get that from the others.

19793. But would you get as much from the second Yeomanry as you would get from an ordinary soldier?—Oh, no.

19794. Not an ordinary private?—No, not an ordinary private who had been out there any time.

19795. But then, of course, they had not been out there any time?—No, I do not think you would get as much from them as you would get from an ordinary private under any circumstances.

19796. You think they must have been recruited from a lower class than the ordinary soldier?—I think they came out entirely for the 5s. a day, whereas the first Yeomanry came out to serve their country.

19797. I was not comparing them so much with the first Yeomanry as comparing them with the recruit that you get for the Army?—

19798. (Sir John Hopkins.) Say your draft of 600?—I should say they came from the same class as they did, but then, of course, they had not had the advantage of the training that even they had had.

19799. (Sir Frederick Darley.) What has become of that draft of 600; are they incorporated in the battalion now?—Yes, they are incorporated in the regiment now. I cannot say whether they are quite all in the third battalion now. I do not suppose they are.

19800. Can you say how they have turned out?—They improved, because they improved before I left South Africa.

19801. Are they now, do you think, efficient men for such a regiment as the Grenadier Guards?—I should think they might possibly have got up to the average

standard by now. You will understand I left the battalion in South Africa, and therefore, of course, I do not know very much of what has gone on since.

19802. In point of fact, what they wanted was training and discipline?—Yes; but if you want to know more about that draft, 100 of them went to the second battalion, and Colonel Lloyd can tell you his experiences of that 100 if you thought the matter worth pursuing.

19803. (Sir John Hopkins.) We have had some evidence about the company officers paying their men, and also some evidence on the part of some officers that a regimental paymaster attached to a regiment would be a great improvement, especially in the field, in connection with the payments of money to the men when required. Have you any views about that?—I do not think that that quite refers to the Brigade of Guards, because our quartermasters are our acting paymasters.

19804. (Sir Frederick Darley.) Then your captains do not pay the men?—Yes, the captains pay the men, but get their money from the quartermaster.

19805. (Sir John Hopkins.) The quartermaster prepares the pay sheet, I suppose?—The captains of companies prepare their pay lists, and then their pay lists go into the quartermasters, and are checked by them—they have a paymaster-sergeant.

19806. Do you find that that system works well?—Very well indeed.

19807. Your system now, I presume, is that the company officers drill their companies. They get their company as a company, and drill it as a company; that is the case, is it not?—They train it as a company during company training.

19808. Is that under recent regulations?—They have trained their company at company training for a good many years—I should be afraid to say how many. The company training is expanded more or less, and has been expanded a good deal at different times.

19809. And you find that an efficient way of drilling the company?—I think there is no question about it. The captain should have the absolute command of his company.

19810. In respect to drill and all other matters?—In respect to everything.

19811. (Sir George Taubman-Goldie.) Between the time when you arrived in South Africa and the arrival of this draft in 1902, had you other drafts arriving?—Yes.

19812. On two or three occasions?—Yes, we had several.

19813. Can you carry your mind back to the condition of those drafts one after the other as they came?—They were all fairly good drafts; there were a good many Reservists in them all.

19814. And what about those who were not Reservists?—They were a better class than the 1902 men.

19815. But they were as good as those you took out with you, perhaps?—I have nothing to complain of in them.

19816. Had they all had a year's training?—Yes.

19817. And they were all over 20 years of age?—That was the stipulation under which they came.

19818. That is what I wish to know. Was that regulation carried out in the drafts between the time you came there and 1902?—As I understand it, yes.

19819. So far as you could judge of the men's age that seemed to be so?—Yes.

Major-General
R. S. S.
Baden-Powell, C.B.

19 Mar. 1903.

FORTY-NINTH DAY.

Thursday, 19th March 1903.

PRESENT:

The Right Hon. the Earl of ELGIN AND KINCARDINE, K.G., G.C.S.I. G.C.I.E. (*Chairman*).

The Right Hon. The Viscount ESHER, K.C.B., K.C.V.O.
The Right Hon. The Lord STRATHCONA AND MOUNT
ROYAL, G.C.M.G.
The Right Hon. Sir GEORGE DASHWOOD TAUBMAN-
GOLDIE, K.C.M.G.

The Hon. Sir FREDERICK MATTHEW DARLEY, G.C.M.G.
Admiral Sir JOHN OMMANNEY HOPKINS, G.C.B.
Sir JOHN EDGE.
Sir JOHN JACKSON.

BERNARD H. HOLLAND, *Secretary*.

Major-General R. S. S. BADEN-POWELL, C.B., called and examined.

19820. (*Chairman*.) You have been good enough to prepare a précis of the evidence which you are prepared to give; if you have no objection, we would like to put it in as a preliminary statement, and you can develop any points of the evidence as you go along?—If you please.

SUMMARY OF INFORMATION.

The Commission asks to be informed on the following points:

1. What steps were taken before the war to raise, organise, and equip my frontier force. (*See I.*)
2. Preparations for the defence of Mafeking. (*See II.*)
3. Deductions as to the use of artillery, and tactics under modern conditions. (*See III.*)
4. Future training of officers and men. (*See IV.*)
5. Any views regarding organisation of Colonial forces of a similar kind for future wars. (*See V.*)

Duties from which my experiences were gained.

My experiences are derived from the following duties with which I was successively engaged:

1. Organising frontier force from 25th July to 11th October, 1899.
2. Defence of Mafeking, 12th October, 1899, to 17th May, 1900.
3. Independent mixed column in northern Transvaal, 18th May to 21st October, 1900.
4. Organising and directing action of South African Constabulary, 22nd October, 1900, to end of war (and its subsequent administration up to 18th February, 1903).

Instructions.

Preliminary Instructions for Frontier Force: I was sent out to South Africa on special service in July, 1899, with instructions to raise a force of two regiments of mounted rifles for the defence of Rhodesian and Bechuanaland frontier.

In the event of war, to organise the local armed forces of those countries; to keep the natives in order, and, especially, to draw as large a force of Boers as possible from opposing the British on their southern borders.

I was employed by the Colonial Office, lent by the War Office.

I.—NARRATIVE OF ORGANISATION OF FRONTIER FORCE.

On arrival at the Cape I found very little help possible from the Army, and therefore went to Bulawayo, where I obtained from Colonel Nicholson, Commandant-General of the British South African Police, the equipment I required from his reserve stores.

About 20 special service officers were sent out from the Army to join me in South Africa. The seniors were Colonel (now Major-General) Plumer and Colonel Hore, and to these I assigned the command of the two new regiments respectively.

We raised men by sending officers to recruit in the principal towns of Cape Colony.

Equipment we got together from both Army Ordnance and from the British South African Police.

Remounts we got principally through the Army Remount Department.

Transport and supplies mainly by local purchase (before the dealers had made the "corners" which afterwards raised prices).

We made the headquarters of the two regiments at Bulawayo and at Ramatlabama (Bechuanaland Protectorate) respectively. (The latter place was chosen because we were not allowed at Mafeking, that is, within the Cape Colony border.)

We framed our constitution and discipline on the Cape Mounted Rifles Act.

We formed the regiments, 450 strong, into four squadrons, each under Imperial Army officers, the troops under Colonial officers.

Decentralisation of duties and responsibilities was instituted as far as consistent with a standard efficiency. Junior officers were made responsible for the training of their units and for their efficiency in all respects. The simplest possible form of drill was employed.

By these methods satisfactory results were attained in a remarkably short space of time. Both regiments were equipped and trained so as to be effective in the field by the end of September, that is, in a period of two months from first starting to organise.

Efficient farriers were our great difficulty, and had to be drawn to a large extent from the Army. Signallers we trained in the force.

Hospital equipment was improvised with the same difficulty.

As for artillery, we had in Bulawayo several small guns of various calibres, all more or less obsolete in pattern. In Mafeking we had four 7-pounder m.l. guns with a range of 2,500 yards. (We were informed that two 5-inch howitzers would be added to our armament, and framed our scheme of defence on that supposition, but when the guns arrived a few days before hostilities we found that by an error the wrong code-word had been used, and our 5-inch guns were 7-pounders of short range.)

As prospects of hostilities increased arrangements were made by which the two regiments with their staffs became the nuclei of stronger forces to be formed by the addition of local police and volunteers in case of necessity.

As war became imminent I saw that even with these additions to its strength my total force would be too weak to effect anything if scattered over the whole border (500 miles).

I therefore asked for more mounted men and some guns.

As these were not available I decided to concentrate my two forces (of about 600 men each), at Tuli and Mafeking respectively, as being, for various reasons, the most important points to hold.

We also improvised six armoured trains for the protection of the railway between Bulawayo and Mafeking, for which Colonel Nicholson organised a small independent force.

Having served with Colonel Plumer in the Matabele campaign, I knew his exceptional capabilities, and handed over to him complete control of the northern (or Rhodesian) force in the event of my being cut off in Mafeking.

I went to Mafeking myself because I considered it the

Major-General

Baden-Powell, C.B.
19 Mar. 1903.

important point on the frontier, for the following reasons :—

1. Mafeking had long been a bone of contention between Boers and British, and was full of stores, and would therefore be an attraction for the Boers.
2. It contained valuable railway works and material (valuing over £130,000) which must be guarded.
3. As the chief town and market, and seat of Government, the large tribes of the north-west considered it to be the hub of the universe, and if we failed to remain in power there our prestige would be lost, and there would be, very probably, a general native rising against us in Bechuanaland and Rhodesia.
4. A mounted force in Mafeking would be strategically well placed for cutting the lines of communication or any Boer moves from the Transvaal against Rhodesia or against Vryburg, or Kimberley; and would threaten Pretoria itself (*à la* Jameson raid), unless watched in force.

II.—PREPARATIONS FOR SIEGE.

Mafeking is an open town, 1,000 yards square, population, 1,000; native town half a mile south-west, population 6,000. Open country all round.

Force about 700 trained men (Protectorate Regiment, British South African Police, Cape Police Volunteers, etc.); 300 Town Guards, railway men, refugees, etc.; 300 native cattle guards.

Armament, rifles, Lee-Metford and Martine Henry in equal proportions; 600 rounds per rifle.

Artillery, four 7-pounder m.l. guns, two 1-pounder Hotchkiss, one 2-inch Nordenfeldt, six 303 Maxims.

Up to within a few days of the war we could not do much preparation openly, owing to fear of the Cape Government; but we got in four months' supplies for men and horses, part locally purchased, part sent up by Colonel Bridge, Army Service Corps, from the Cape.

We had spies and intelligence agents out across the border, and scouts in various directions, and were thus kept well informed of the Boers' doings.

We laid dummy mine fields round the place.

In the middle of September Colonel Vyvyan secretly organised the Town Guard, and stored arms and ammunition ready for use in the town. Spies and suspects were watched.

At the end of September I was transferred with my force to be under the orders of the General Officer Commanding in South Africa.

A few days before the war was declared we sent away 170 women and children to the Cape.

We dug bomb-proof galleries for the remaining 600 women and children who were placed under the management of the Mayor, Mr. Whiteley.

Fortified Cannon Kopje. Laid defence railway line round north-east front of town.

Took over all supplies in the town and all market gardens, and put inhabitants on rations (on payment). Increased hospital accommodation. Instituted Court of Summary Jurisdiction. Dug wells for alternative water supply.

Made a circle of independent earthworks round the town, giving a perimeter of six miles (which was at first considered by some officers to be too large, but which eventually had to be extended to nearly 10 miles before the town was out of enemy's rifle fire).

Siege of Mafeking.

I presume a detailed narrative of the siege is not required.

Its phases were as follows: In October-November Cronje invested the place with 8,000 Boers. He attempted several attacks unsuccessfully, and after a month withdrew nearly 5,000 of his men to Kimberley.

From November to January Snyman pushed his works nearer, but we, on the other hand, pushed out works to counteract this, and in January, February, March gained ground, until we had added four miles to our original perimeter.

On 12th April Eloff made his attack into the middle of the place, and found himself encircled there, and had to surrender.

A week later Plumer and Mahon joined hands and effected our relief. Plumer had, in spite of the enemy, continually in superior numbers, established himself for some weeks past in our neighbourhood. Had the relief failed we had made plans for breaking out of the place when our provisions failed, probably about 10 days later.

Our ration at this period was: $\frac{3}{4}$ lb. horse sausage or meat, 6oz. oat cake, 3 pints sowens, $\frac{1}{2}$ oz. tea.

Boer numbers contained on their North-West Frontier.

The total force of Boers against us on the northern frontier for the first six weeks of the war amounted to over 11,000.

I presume there is no need for me to describe the work of the Rhodesian column of my force, of which you will have had General Plumer's evidence.

III.—USE OF ARTILLERY.

Those who have sat under artillery fire are probably as good judges of its effects as the trained artillery officers who direct the fire.

It was calculated that 1,300 rounds from a 94-pounder and over 20,000 other shells were fired into Mafeking.

The Boers had, as a rule, 8 to 10 guns against us in Mafeking, including one 94-pounder Creusot, three 15-pounder h.v. guns, two pom-poms, and some old 9 and 7 pounders.

They used these guns principally in pairs or in groups of three, of various calibres.

The chief fault of their gunnery was want of concentrated or systematic fire on any one point. Generally, when they began to have an effect on one spot they changed their target to some other. Also, they never burst shrapnel over us, which would have been effective. The guns we liked least were the pom-poms, as they opened suddenly from unexpected points; they found their target quickly, and were demoralising; but the actual men-killing effect of the guns was comparatively small.

Our own armament was most inferior, but in spite of this it was wonderful what good effects it achieved through intelligent, non-regulation method of use (such as taking the guns out quietly by night to a prepared masked position, lying low all day until they were in the eye of the setting sun, firing through blankets at night, etc., etc.). (See Heading VI., paragraph d.)

IV.—PRINCIPLES OF FUTURE TRAINING OF OFFICERS AND MEN.

Junior officers should be given responsibility from their first entry into the service. They should be made to really command their unit, however small, and be answerable for its efficiency and success. They will thus be able to command any isolated position, or in crises.

The large majority of officers are keen enough and intelligent enough, but want to be given a real job in which to make their name, and develop their professional interest. The so-called chain of responsibility is too often one of irresponsibility. Resource and cunning in the field should be encouraged, especially at manœuvres. Barrack-square drill, and deadening routine should be reduced as much as possible, and competition introduced to a greater extent into practices tending to perfect men, whether in riding, shooting, skill at arms, detached duties, an increased individual intelligence if essential to work in the field. With officers accustomed to work on their own responsibility, and with men using their own intelligence working under them, senior officers will be able with confidence to give their subordinates a free hand in carrying out their orders for co-operative movements, or for special ventures unhampered by the usual (and so often fatal) tugs on the check strings.

For better economy more attention should be given in the education of junior officers in book-keeping and store accounting, etc., and if some method might be devised by which senior officers had an interest in making out the annual estimates, it is probable much economy would thus be gained.

V.—BEST METHOD OF RAISING, ORGANISING, AND EQUIPPING COLONIAL FORCES OF THE SAME KIND.

Arrangements should be made in peace time by which a commando law or militia or volunteer organisation should ensure the nucleus of a force, with a trained Army officer as adjutant to each unit, and an experienced Army officer as Inspector-General, the whole organisation being capable of extension in time of war. Horses and transport should be registered and reserve equipment should be kept in ordnance stores for the numbers that would require it. Unless some such measures are taken it means a great expense of suddenly raising a force, and training and organising with inadequate means; and the employment of a number of Imperial Army officers, whose services can ill be spared at such a time from their own regiments. Under such circum-

stances a certain proportion of Army officers, practically up to half, is necessary first for moral effect in gaining the confidence of the untrained men and officers; secondly, in the practical fact of saving waste in the systematic care of stores, supply accounts, etc.

The most convenient organisation for rapid training and use in the field is the troop of about 80 to 100 men, subdivided into about 10 combatant squads of a corporal and six men, every man horsed; each troop an independent unit with its transport, medical orderly, farrier, saddler, pay-sergeant, etc. The squad to be the permanent unit in the troop whether for work in the field or in camp, or for patrols, outposts, and other detached duties. These small units, with good men in responsible charge, very rapidly acquire efficiency when the organisation has to be hurried (compare South African Constabulary.).

These troops can be at any time combined to act as squadrons, or can be immediately dispersed to perform independent duties if required.

VI.—DEDUCTIONS AND NOTES.

(a) *Mounted Troops.*—The results of experiences with the mounted irregular forces which I had from Australia, Canada, and South Africa, working both independently and at other times in co-operation with other armies, have generally tended to confirm theories formed before the war rather than to start any widely new ideas, particularly regarding cavalry.

I am not, therefore, regarding the South African War as necessarily providing a law for all future campaigns.

Cavalry are more essential in modern war than they ever were before, both for extended strategical moves, for wide reconnaissance, for distant raids, and for tactical flanking operations beyond those nearer tactical combat duties for which mounted infantry are designed.

(Except the Tugela Heights, no big fight in this war was won without the aid of cavalry.)

In both my forces from want of cavalry we had to try to get cavalry work out of troops which were in reality mounted infantry, and though they worked splendidly to attain the required results, it was not the same thing.

Efficient horsemanship is essential to success for cavalry. This cannot be picked up at once by hastily organised troops. It is a matter of experience and training (which even yet requires developing in the cavalry).

The particular arm with which they appear on the field is not so essential to success as their ability to be there on a sound horse at the right moment. And in any case they must be able to shoot.

The steel arm, whether sword, lance, or bayonet, must be sharp. A really good swordsman is most difficult to train. No amount of the usual barrack-square sword exercises will ever make a swordsman, but an indifferent swordsman with a sharp sword has the advantage over a fair swordsman with a blunt one. Very few of our officers or men knew how to sharpen a sword or how to keep it sharp on service.

(b) *Field Movements and Detached Duties.*—One principle may be applied for all field movements, detached duties, etc., and it is easily picked up by all ranks—namely, the employment of units in an irregular triangle or diamond shape.

This general principle applies equally for all units, from a Division down to the individuals of a patrol, whether in action or on the march, or in the disposition of defence works or of defensive camps or outposts, &c.

Distances and intervals vary according to the strength of a force, the nature of the country, etc.

It fronts in every direction, and automatically supplies supports and reserve.

(c) *Field Works.*—The old regulations teach some rather dangerous principles. Field works should, as a rule, face in all directions (of all the many hundred works so made we had in Mafeking, Rustenburg, and all over the country in the Constabulary, we never lost one work, though they were often held by very small squads and attacked by very large numbers of the enemy).

The so-called Boer trench is a good one in certain positions, but requires a command amongst high grass, etc. It is often useful to leave bush and other cover standing in the immediate neighbourhood of the trench to afford concealment. The Boers pushed their entrenchments against Mafeking close up at the front where we least expected them, because of the open flat ground. They effected this by night, each man carrying a spade and half a dozen sandbags, and by dawn they had erected a very fair fort. The trench used by the Constabulary was a long narrow one shaped in the form of a O or an S, length 6ft. to every man occupying the trench (so that they can sleep in it), 2ft. 6in. wide at base, roofed in with a splinter-proof roof; command usually about 2ft. Reserves of water, food, ammunition in each work. Covered way to kitchens and latrines.

Wide and low loopholes are a necessity for effective shooting, and to prevent a panic inside an enclosed work; 4ft. in place of 4in. recommended as proper width.

(d) *Artillery.*—The want of a light and extremely mobile gun was very much felt. Such is made by Armstrong, namely, the 3-pounder quick-firing gun, with a light carriage capable of being carried on pack-saddle. Range about 4,500 yards, firing shrapnel bursting at 3,000 yards.

It has to be, and has been, realised that the real effect of artillery fire is practically its moral effect, and a mobile quick-firing gun does as much damage as heavier ordnance, but has the merit of being transportable over any kind of ground by night, and it is by night that mounted raids, etc., have to be continually carried out.

(e) *Reserves of Equipment.*—Such reserves of saddlery, arms, ammunition, boots, clothing, bandoliers, etc., should be kept up in the Colonies.

(f) *Local Supplies.*—Arrangements are desirable by which "corners" by "operators" in local supplies of transport, food, forage, etc., can be prevented at the outbreak of war.

(g) *Imperial Forces in Colonies.*—An ordinance is desirable by which Imperial Forces may be raised or located in British Colonies. (Compare difficulties previous to Mafeking.)

(h) *Farriers.*—The want of good shoeing smiths and farriers was much felt in first organising.

(i) *Discipline.*—Adequate deterrent field punishments are much needed.

The powers of officers require increasing for detachments on service.

The officer commanding should have powers of dismissal.

(j) *Recruiting.*—Finger-prints.—It is worth considering a system of finger-print registration which will prevent re-enlistment in other corps of undesirables. In the recruiting for the Constabulary it was found useful in preventing personation and in allowing signatures for illiterates or native employees, for identification purposes, pay receipts, etc.

(k) *Saddlery.*—We have tried most kinds, including regulation cavalry, mounted infantry, Indian cavalry, Lock Elliot, Canadian, Mexican, Austrian, Australian, and Colonial patterns. The latter gave the fewest sore backs, was the most popular, and does not admit of excessive extra kit being carried.

(l) *Firing Mounted.*—Firing mounted was successfully practised in the South African Constabulary, and was very effective in action.

(m) *Transport.*—For the more efficient and economical work I had proposed to try mules three abreast for two-wheeled vehicles, and three or four abreast for four-wheeled vehicles, but had not started the experiments when I left South Africa.

19821. You went out to South Africa, I think, in July, 1899?—Yes.

19822. And the object of your going out was to raise two regiments, was it not?—Yes; originally they told me to raise one, and then when I got out there I got orders to raise a second.

19823. Have you got the precise instructions that you received?—No, they were more or less verbal, especially with regard to the point that I was to raise these regiments for the defence of the border, and to detain as many Boers up there as possible if war came on. That was a verbal instruction from Lord Wolseley.

19824. You had a letter of instructions, I think, which General Plumer saw?—Yes, I had a letter of instructions.

Major-General
R. S. S.
Baden-Powell, C.B.
19 Mar. 1903

Major-General
E. S. S.
Baden-Powell, C.B.
13 Mar. 1903.

19825. Besides that there were these verbal instructions?—Yes, that was impressed upon us more than anything, to contain as many Boers up that way as one could, in addition to defending the frontier, of course, and keeping the natives in order, so that they did not rise in Rhodesia and the Bechuanaland Protectorate.

19826. You were under the Colonial Office?—Yes, lent by the War Office.

19827. And how long did that position continue?—Up to the middle of September; towards the end of September I was handed over to the Army with my force complete.

19828. Then you became part of the force in South Africa?—Yes.

19829. You have given us the headings of the manner in which the frontier force was organised. Are there any points which you would like to develop in that matter?—The difficulties in starting a force like that were that there was no organisation in the country to work upon. One could not get supplies of equipment ready; there were no reserves practically in the country, except by chance. There was nothing regularly and systematically laid down for raising a force like that. There was a great difficulty in getting officers ready made. You had to draw on England, on the Army, for officers to organise the force, because Colonial officers are excellent men for leading troops in the field, but naturally they have had very little experience in raising a force, and especially in training the men carefully in the essential points (and not the minor drill, which is so unnecessary), and in keeping accounts of stores and equipment. That is where we found they were so wasteful; they had no idea of keeping accounts either of stores or supplies or of issuing supplies on any kind of economical system. You had, therefore, to have Imperial officers from the Army just at the time when they were most required for their own regiments.

19830. Had you enough Imperial officers?—We had just enough to go on with, but the officers from the Army only formed from about one-third to one-half our strength.

19831. You had about 20, I think you say?—Yes. Then we had a few sent up afterwards to General Plumer; they could not reach me. I suppose there were 25 in all, and they formed about one-third of our strength of officers. They were very useful as commanders of squadrons, and, of course, for the staff of the regiment.

19832. I suppose you consider it essential to have Imperial officers in those regiments?—Unless you could organise forces in the country beforehand in peace time—a regular standing force, by which they would have practically trained officers available in their own colonies.

19833. Even then would not the experience of a Regular officer be serviceable?—Certainly, for the heads of regiments, and even of squadrons, and I think the Colonial officers certainly then would always prefer themselves to have experienced officers over them, because it gives them much more confidence, and the men too, especially since this war they have got to understand each other so very much better than they ever did in the past. They find they are not of a different breed altogether.

19834. Then there was no organisation at all?—None whatever.

19835. But you had this advantage over others who had to raise regiments of the sort during the war, that you began two months before war broke out?—Yes, and I knew where to go to get things, because I had served out there in 1896-7, and I knew that there was a great deal of material left over from the Matabele War, and up in Matabeleland.

19836.—In what way?—In the way of saddlery, equipment, ammunition, clothing, and that sort of thing, and even old transport and old stores, a supply of tinned meat, and so on, because we had a good lot of it in Mafeking as a reserve, so I went straight up there instead of trying at Cape Town, where I found the stores were at a very low ebb, and even there they could not have been issued without a lot of formalities. I got most of mine in Bulawayo.

19837. And did you have enough?—Yes I had enough for my force, but it would not allow of any reserve for

a further supply; it just fitted it out, and that was all; there was nothing to fall back upon for making good deficiencies and so on afterwards. And the transport and supplies one had to get as best one could on the spot up there.

19838. General Plumer told us that traders filled up their supplies in advance?—Yes, they saw what was coming, and they filled up; they were largely advised to do so, I think, by Colonel Nicholson; he saw what was coming, and they had about eight months' supplies in Bulawayo before the war began.

19839. Which it would have been very difficult to get if that had not been done before the war?—Yes.

19840. Where did you get your men from?—I got my men chiefly from the coast ports and the chief towns, like Grahamstown and King William's Town in Cape Colony, East London, Port Elizabeth, and those places.

19841. And on what conditions did they enlist?—On a three months' service engagement, and the retention of their services in the event of war—that they could be kept on to any extent for the duration of the war.

19842. At what pay?—At 5s. a day.

19843. Did you have any difficulty in getting them?—No, no great difficulty. We could not get entirely good men, because there was an uncertainty at that time whether war was coming on or not, and the men did not care about leaving their employment. We really got a good percentage of loafers amongst those, to such an extent that in Bulawayo I deferred taking on men a good deal until we could see whether the war was really coming on or not. But I organised in the meantime a great many of the young respectable fellows in employment there, who said they would come out directly war was certain; we organised one squadron entirely of those fellows; they used to come out to drill when they could get leave from their employers, and we had the horses, transport, and everything organised ready for them, so that when war did come they came out as a squadron complete, and joined General Plumer's force. They were first-rate.

19844. Were you satisfied with the others?—They were a very mixed lot. They did very well on service; they would never have done in peace time.

19845. And as regards the horses?—The horses we bought through the Army Remount Department chiefly. For the first three days we were not allowed to buy them, and then afterwards they joined in and let us have them.

19846. You were not allowed to do so?—The General seemed doubtful about war coming on, and he said there was no hurry about it, so I started to buy them myself; then when he saw that I was anxious to get them, he allowed the Army Remount Department to help us.

19847. The General at the Cape you mean?—Yes.

19848. (Sir George Taubman-Goldie.) Was that Sir William Butler or Sir Forestier-Walker?—Sir William Butler. It was only a matter of two days.

19849. (Chairman.) Had the Remount Department a war establishment at the Cape at that time, or was it the ordinary peace establishment?—A war establishment; Colonel Stevenson had been sent out previously to my arrival.

19850. To buy horses in the country?—Yes, to buy horses in the country and send them up to me at Kimberley.

19851. So that you had South African horses?—Yes.

19852. Were you satisfied with them?—Very satisfied.

19853. You say that you framed your constitution and discipline on the Cape Mounted Rifles Act. What is the meaning of that?—That is an Act which exists for raising an armed force by which the High Commissioner is allowed to raise armed forces, but though it is supposed to apply to Cape Colony only, that is the only place where we were not allowed to use it. But we applied similar rules to our raising which were extended to suit our circumstances in the north.

19854. How do you mean that you were not allowed to use it in Cape Colony?—We were not allowed to raise an armed force in the Cape Colony; we were obliged to raise it outside.

19855. That was under the regulations of the local Government at the time?—Yes; therefore we could not use Mafeking really as a base during peace time. We had to raise our force outside the boundary, which was

18 miles north of Mafeking, in the Bechuanaland Protectorate.

19856. Were you positively prohibited?—Yes, and it is only because we had large stores in Mafeking, and there was danger of their being set fire to by the enemy's agents, that I was then allowed to send a guard down to protect them.

19857. You could accumulate the stores in Mafeking?—Yes, there was no objection to that.

19858. Have you anything else to say with regard to the raising of these regiments?—They had to be raised very rapidly, and the training had to be carried out very rapidly, and in order to do that we had to reduce our drill to a very simple form. We decentralised authority therefore as far as possible, so that we put responsibility on the younger officers each for his little unit, and trusted him to get it into good order as quickly as possible. And that was quite successful; they were in good order and trained ready for the field by the time the war broke out; that is to say, in a little over two months from the time they first started to organise. The officers worked day and night, and got things into shape somehow. And the men were certainly very good in the field. I inspected them all just before war broke out. We used to have field days, but it was more of a practical training; there was not much drill about it, but they were training in the field continually, and had sham fights against each other, the man getting handled by his officers the whole time, and each individual group under his non-commissioned officer.

19859. I suppose it was exactly the sort of work that your men had to do afterwards?—Exactly.

19860. But could you get enough discipline instilled into them by that amount of training?—Yes, because they had to use their own intelligence so much, and worked a great deal by that. In a spread out formation each man had to keep his eyes open and see what his officer wanted out of him. It was more like playing a game than doing any special ornamental drill.

19861. With regard to hospital equipment, there was some difficulty about that, was there not?—Hospital equipment was very difficult to get at first, because we relied rather on finding it on the spot, and there was not much in that way in the chemists' shops. We had to buy up all the stuff we could.

19862. What medical staff had you?—Medical officers were very hard to get. We had to get doctors from the town to join us as Volunteers, which they naturally did not care about doing without very large pay. We eventually got one Army Medical Officer sent up to each column, Colonel Plumer's and Colonel Hore's; but in each case we had to use local physicians a great deal, and they demanded pretty high pay for it, which was granted by special order.

19863. Was the hospital work satisfactory?—It was efficiently carried out in the end, but we had to make our own ambulances out of wagons, fit them up, and put extra springs on, and so on, and manufacture stretchers, and that sort of thing.

19864. With regard to artillery, you were short of that?—We had a good number of odds and ends of small guns, but they were nearly all obsolete—small weapons, and with very small range, and generally firing smoky powder.

19865. They were 7-pounders, as a rule, were they not?—7-pounders.

19866. (Sir George Taubman-Goldie.) Had you any mountain guns?—We had four mountain guns in Bulawayo, two of which were rather played out, having gone through one campaign at least before, and a very mixed lot; we had a one-pounder Hotchkiss, a Gardner gun, a Gatling, and six Maxims (two of them Martini-Henry Maxims), and a great mixture of ammunition.

19867. (Chairman.) That mixed ammunition must have increased your difficulties?—Yes, greatly. They had only been kept there by the police for arming forts in different outlying districts. They were never intended for a mobile field force.

19868. Was nothing sent up for you?—No, except two 7-pounders, which were sent up to Mafeking.

19869. Which you had been informed were two 5-inch howitzers?—Yes.

19870. That was a mistake in the telegram?—Yes, they used the wrong word in the telegram in the code, saying that they were sending up 5-inch howitzers. In

planning our scheme of defence for Mafeking these two 5-inch howitzers would have covered the whole of the defence, and we put our two forts on each flank of the town, and when they did arrive they were two 7-pounders that would not fire as far as the town from those forts; they were no use at all, and were without sights, or wheels, or proper ammunition.

19871. As the war became imminent you found it necessary to divide your force?—Yes. We had to protect 500 miles of border, and it was impossible, of course, to hold that with 2,000 men, which we amounted to altogether; so we divided into two columns, one in the north on the road between Bulawayo and the Transvaal, the main road, at Tuli, which I handed over to Colonel Plumer; and the other was concentrated at Mafeking, as being the most vulnerable point of the Transvaal to threaten. And in order to draw Boers up into that part of the world which we had been ordered to do, I also pretended that we had a third force in between the two, and that drew a fair force of Boers up there, 1,200 men stationed there waiting for this force which never came—it did not exist.

19872. It did not exist?—No, but they thought it did.

19873. What was your special object in holding Mafeking itself?—Mafeking was such an important point up there, in the eyes of the natives especially. "Who holds Mafeking," they used to say, "holds the world," because it had always been a bone of contention between Boers, British, and natives for generations past, and whoever held on there had the prestige amongst all the natives. If we lost our prestige there natives of the Protectorate would probably have gone over, and naturally the Rhodesian natives would have followed suit; they would have risen and had the whole country up north. Apart from that, the Boers were always very anxious to get it; they had always had an eye on it, and it was also full of stores and supplies, and things which would have been useful to them which we had been collecting for months, and it was very near the starting place of the Raid; so that they naturally expected that another raid from that direction would be possible into Pretoria. Therefore, they would have had to watch it in any case with a pretty strong force if we kept mounted men there. That is why I kept mounted men there, both as a threat and because if they did go away we could actually make a raid and dash in if necessary. It was a very convenient jumping off place. Then it had large railway shops, and a good number of locomotives and rolling stock valued at about £130,000, belonging to the railway, which also wanted protection. On all these accounts I settled upon it as a place that ought to be held at all risks, at first at any rate.

19874. What force had you to hold it?—I had about 700 trained men. I did not give you the exact number there, but I have them if you like to have them. The Protectorate Regiment, 469; British South Africa Police, 72; Cape Police, 92; and Bechuanaland Rifles, 83; that makes about 700 trained men. And a Town Guard of shopkeepers, people who had never handled a rifle, railway men, and refugee farmers, of about 300; and, in addition to those, we armed 300 natives to look after cattle, and prevent their being looted when they were out grazing, and so on.

19875. But you did not use the natives in military operations?—No, we tried to make them defend their own town, but on the first attack on the town they all ran away, so we did not rely upon them at all.

19876. When you say you had 700 trained men, they would have been trained in the way that you have been describing?—Yes, they had only had two months' training. Then the police force was good, they amounted to 160 men; they had all been drilled; but then again some of those we could not rely on, about 45 of those were Cape Dutchmen, and we were not quite sure of them.

19877. You had no Regulars at all?—No; excepting about a dozen farriers.

19878. Not to work the artillery?—No, that was done by the police.

19879. I do not know that it is necessary for our purposes to take you through the incidents of the siege?—No I suppose not.

19880. They are very well known. You say that before the beginning of the siege you had spies and intelligence agents out across the border?—Yes; the Intelligence Department had one officer, and he had several agents under him in the Transvaal. And I sent

in another officer to Pietersburg, because he was able to get a lot of information there, having lived there himself before, and that was where some of the meetings of the Boers took place, about going up against Rhodesia; so that we knew they were going to go against Rhodesia; and we got information from these agents, and a lot of their sub-agents about the country, who were very well-informed as to what was going on, so that we could tell exactly the number coming against us, and everything, and what their intentions were.

19881. Does the Intelligence Department mean your Intelligence Department?—No, the Army had one officer up there.

19882. From the Intelligence branch of the Army?—Yes, he was called away just before we were shut in; but up to that time he had been giving us very full information, and had prepared maps of the country in the Transvaal, if we wanted to make a forward movement to Pretoria.

19883. When did he come up?—He was out there before I was; some time in June I fancy.

19884. (Sir George Taubman-Goldie.) Who was he?—His name was Read.

19885. (Chairman.) He was an officer of the Intelligence branch of the Army?—Yes.

19886. And he had an organisation there?—Yes, he worked with local traders and people, and had his agents about.

19887. Had you an Intelligence branch and an Intelligence officer?—I had an officer for Intelligence, and he used to collect all he could from Read, and from one or two other men we employed ourselves.

19888. When you say you employed them, that means you had funds available?—Yes, we paid two of them, took them on the strength of our regiment and paid them out of the funds of it, out of the pay for the regiment.

19889. Had you any discretion given you to spend money in that particular way?—Yes. I had a certain sum allowed me, and given me on imprest to expend on the estimate I had sent in previously as to what the regiment would cost, and the cost of food, forage, and so on.

19890. That was for the regiment?—Yes, there was no special secret service fund.

19891. All the information that you got was outside any secret service work?—Yes.

19892. But you think you got as much as you required?—Yes, we were quite well informed of what was going on. And we had maps made. I sent down another officer to Pietersburg to make a map of the road that way, and we had all that mapped out and printed on canvas, and issued to the officers.

19893. Then in your paper you mention a certain outstanding incident; is there anything you would like to say with regard to that part of it?—During the siege, do you mean?

19894. Yes, during the siege?—No; it has sometimes been asked whether we were very hard up at the end, and why we should not have held out much longer, or could not have gone on much longer, and the facts have been rather misrepresented about the supplies that we had there, because we supplied Bulawayo the moment we were relieved. That looks as if we had a lot of supplies there. As a matter of fact, we had about 10 days' supplies left at our then ration, which was very small; and I doubt if the men would have had much strength after another 10 days, so that we could not very well have reduced on that ration. The ration was three-quarters of a pound of meat (generally horse sausage), six ounces of oatcake that was made out of the horses' oats, three pints of sowens, a sort of porridge made of these oats also—the same oats had to go through both operations—and half an ounce of tea. That just kept the men fit; it did not leave much strength in them, and if we had reduced it I think the men would have so broken down that they could not have got out at all. My intention was, therefore, supposing the relief had failed on the 18th of May, which was the day when I expected it, to have broken out somewhere in the next 10 days, and joined hands with Plumer, who was brought down into our neighbourhood for that special purpose if Mahon's force had failed to relieve. But I did not want to do it, on account of the prestige of the place with the natives.

19895. And how long had you been on that reduced ration?—For about two months. When the relief actually took place I called for returns of the number of men capable of marching five miles, because we wanted to go out and join in the fight when the relief came on, and we had only 180 available for that.

19896. The others were too weak?—The others were too weak.

19897. Was there any grumbling about the ration?—None whatever. They saw it was necessary. I used to publish a lot of information every day, which I found was much the best thing for keeping people satisfied. I published, in fact, everything we knew, and the fact that we had such a lot of rations to hand over was due to the fact that the moment we did get relieved—we were relieved at two o'clock in the morning, say—we went out at seven, at daybreak, and attacked the Boers still in their commandoes. They were not aware of the relief force having got in; they were still waiting for it on the east side, but the relief got in on the west side in the night, and we dashed out on the east side and captured their laager and followed them up the next three or four days into the Transvaal, perhaps for moral effect. We went to Snyman's farm, a late commandant of the Boers, then, and captured all his sheep and cattle, and brought them away. Those I put into the relief train that came down with food from Bulawayo for us, and sent them up as a present in return, as we could not do anything with them. That was how it came about that we had all those things in Mafeking.

19898. They were really captured?—Yes; we dashed out, and captured them before the Boers could get them away. We got about 2,000 sheep.

19899. You calculated that there were about 11,000 Boers against you in the early part of the time?—Yes; that is the lowest. There were 1,700 against General Plumer, 8,000 at least—some put it at 9,000—at Mafeking, and 1,200 against this imaginary force at Sefatimis. I had written a letter to a man who I knew was dead, in the Transvaal, to say this force was coming down, and the Boers opened this letter and read it, and so sent this force up.

19900. That is 11,000 along the whole stretch of the frontier?—Yes; along the whole north-western frontier.

19901. Of 500 miles?—Yes.

19902. The next head on the paper is "Use of Artillery"?—We had a good taste of artillery fire in the place, and we could judge very well the effect of it; when sitting under fire you can judge the effect, I think, better than when you are using the guns. We found that mostly the effect of it was moral; the artillery fire did very little man-killing, as a matter of fact. However, they made very good shooting; they had some German gunners, and they made some very good shooting direct on to the target, but it had very little effect beyond the moral effect; therefore, we found that the big guns were much less terrifying than the small mobile guns which they used to take about, suddenly coming upon us from some unexpected quarter, and pouring a rapid fire into a certain spot, and before we had become accustomed to it they had gone somewhere else, and poured in another rapid fire from some other point with smokeless powder. That was much more effective than the big shells which you knew were coming, and you knew exactly where they would fall.

19903. (Sir George Taubman-Goldie.) Were their fuses good?—No; the shells never burst in the air.

19904. You would have found their fire much more effective if they had had good fuses?—Yes, the small guns burst shrapnel, but the big gun never did. They used to fire shrapnel with percussion fuse.

19905. (Sir Frederick Darley.) What range had the big gun?—They were firing at about 5,000 to 6,000 yards as a rule. They shifted about a good deal.

19906. (Sir George Taubman-Goldie.) Would you say that the effect was moral only with good and well-timed fuses?—Yes, to a great extent. In the field we met them afterwards many times with 15-pounders, and they never seemed to do any damage. You could see clouds of dust all round the men they were firing at, and smoke, but they never got hit. At times it varied, too. Sometimes you would find a gun that could not hit at all; it could not burst its shell in the least.

19907. (Chairman.) We have had some evidence that

when they were fired at excessive ranges the Boer shells were very ineffective?—Yes; that is quite true. The pom-poms were really as effective as anything, because they poured in such a lot, and so quickly.

19908. But they did not do material damage?—No damage whatever; I had two men killed by pom-poms, and a good many thousand men fired at.

19909. (*Sir John Edge.*) Were they killed by the burst of the pom-pom shell, or from being struck by it?—From being struck by it.

19910. (*Chairman.*) The bursting of the pom-pom does not do any damage?—No; but the moral effect is good, and they find their range so quickly with it, too.

19911. Your armament was very inefficient, of course, as compared with the Boers, from what you have been saying already?—Yes, very. I think the best gun we had was the 1-pounder Hotchkiss that we used to go at the Boer big gun with; and we had a 2-inch Nordenfeldt, which was no good, but by digging a hole, and hiding it behind a bush, we could every now and again get some very effective shooting in, as long as they did not know where we were. We had to do it all by ambush. We manufactured one gun, and we dug up an old naval gun there, which was the best gun we had for distance.

19912. (*Sir John Jackson.*) As regards the moral effect of the pom-poms, the men very soon learnt, I suppose, that they were not effective?—Yes; the men did not mind them a bit after a time; in fact, they did not mind anything. They did not mind the big guns at all, but still it used to annoy them.

19913. But in that case they would not have much moral effect, would they, after a time?—No.

19914. (*Chairman.*) What do you mean when you say that you used to fire through blankets at night?—When the enemy fired at us we could always see the flash of their guns, and so we knew that it was coming. Accordingly, when we fired at them we put blankets in front of the guns, so that they could not see the flash, and we let them have it suddenly and unexpectedly. We always had to do dodging in firing like that; we had to creep the guns round at night, and hide them during the day.

19915. Then we pass on to the training of officers and men in the future?—I did not quite know whether that question applied to the general principles in the Army, or merely as to the raising of irregular forces, but really the same principle applies in a great measure to either case. I think the junior officers want more responsibility given to them. From the very first they should be accustomed to taking responsibility on their own shoulders. It does not matter how small a unit you give them, as long as they are actually responsible for it. At present they are so much shifted about from one unit to another that they never have any real job of their own, as it were. In the Navy a midshipman has his boat to look after; he is responsible for it, and is accustomed to responsibility from the very beginning. I am sure that our junior officers would take much more professional interest in their work if, from the very first, they were inoculated with responsibility in that way.

19916. In your paper you state what, in your opinion, is the most convenient organisation for rapid training and use in the field; would you mind reading that paragraph again?—"The most convenient organisation for rapid training and use in the field is the troop of about 80 to 100 men sub-divided into about 10 combatant squads of a corporal and six men, every man horsed; each troop an independent unit with its transport, medical orderly, farrier, saddler, pay sergeant, etc. The squad to be the permanent unit in the troop whether for work in the field or in camp or for patrols, outposts, and other detached duties. These small units with good men in responsible charge very rapidly acquire efficiency when the organisation has to be hurried." This is rather my deduction from the Constabulary quite as much as from the first force, because in the case of the Constabulary we had to raise 10,000 men and put them in the field as rapidly as could possibly be done with practically no assistance from anybody; that is to say, the Army could not spare the good officers that we wanted, and they could not spare non-commissioned officers and men, so that we had to raise men in England and send them out to Africa and train them as best we could, and that was the organisation that I found was the best, namely, to put them into small units of from

80 to 100 men under a good officer who was responsible for training them and using them in the field; and the squad was the unit. We put six men into a squad under a corporal, a selected man, and he was expected to do everything with that squad, to teach them to ride and to shoot, and his squad was to be the best in the troop. There was always competition between all the different squads as to which was the best. The corporal in charge in the field watched what the signals were, and brought his squad up to the right place, and worked it entirely. The squad had only to produce four men for duty out of the six, so that that left a margin always for one or two men being sick or kept for duty as cooks and other duties, but you always had four men in the field working effectively, and they lived together, so that if you wanted a sentry you simply said such and such a squad will find a sentry, and they arranged amongst themselves who was to do it.

19917. What number of men did a subaltern command?—It began with a captain and a subaltern commanding a troop, but latterly we found they could work very well with just a captain in charge of a group of troops, practically a squadron (that is three troops), and a subaltern in charge of each troop. But at first, when there was so much work in hand, it was just as well to have two, a captain and a subaltern.

19918. I think you attach considerable importance to the training of junior officers in finance and supply duties?—Yes, that is where we found them fail a good deal, and it is what I have gone in for a great deal in the Constabulary; that is to say, they all go through a course in the Accounts Branch, the Supply Branch, and in the Ordnance Branch, and account for all their different stores; and then when they first come to be in charge of stores they do not lose money over it. They understand proper bookkeeping, and they see to it themselves instead of leaving it in the hands of a non-commissioned officer who may defraud them.

19919. And would you apply that to the Army generally?—Yes, I think so certainly. The account keeping is too much left in the hands of non-commissioned officers, and it is rather tempting them to be left with money in their hands, as often happens.

19920. I asked the question because there has been a good deal of criticism of the fact that the company officer has to do so much accounting in the Army?—Yes. I think that is because he is rather too much of a gentleman. I think it is much better for him. I quite agree to his having it taken out of his hands if possible, because he has really more than he can do in training his men, and he will have especially nowadays if it is to be shorter service.

19921. It has been suggested that there should be a regimental paymaster instead?—I certainly would prefer that.

19922. Then where does your training of junior officers in accounts come in?—If they will not allow them to have paymasters I certainly would have the younger officers who are to be in charge of accounts trained in that special work, because now it is left to them to learn it as best they can, and some learn it and some do not.

19923. But if you were to have a regimental paymaster there would be no opportunity of training junior officers in accounts?—But there would be no necessity for it then.

19924. They would not want it in the Army, but you would not get officers trained in accounts for use with irregular forces?—I think certainly that with irregular forces the officers ought to do that work.

19925. I mean that then the Army officer would not be trained for that purpose?—No, he would not.

19926. Then that does not mean what you say here, that there ought to be some arrangement in time of peace for the organisation of these Volunteer forces in time of war?—Yes, it does, and that they should be trained to look after their own accounts, and issues of clothing, stores, supplies, equipment, and money.

19927. (*Sir George Taubman-Goldie.*) But there are always a certain number of officers and any number of men who will take to accounts or anything else that they are put to?—As clerks, do you mean?

19928. No, I am talking of the difficulty of getting men suddenly appointed to irregular forces to do accounts. There is always a certain proportion of men

Major-General

19 Mar. 1903.

Major-General
R. S. S.
Baden-Powell, C.B.

19 Mar. 1903.

who can do whatever they are put to?—You can always find men who are willing to do it, but who have not an idea how to do it.

19929. But I mean men who are competent to do it. I have known men who have never seen an account before in their lives, and when they have been put to it they have done the accounts just as well as any clerk could do them?—Certainly, I agree with that. I think it is wonderful what they do in that way. I know we had 100 troops in the South African Constabulary, and in each of those we were able to find good accountants for supplies and stores and such things; but, even so, there was an enormous amount of waste; they had no idea of any good system right through the corps. Each man has his own little system, and they mean well, but a lot of them do not work at all well for the ultimate end of saving expenditure, and stores, and waste of supplies—that always went on.

19930. My question was whether, if there was a regimental paymaster for every regiment, which was the old system, of course, it would be necessary to train the officers of the Army as a whole as accountants, provided a few good men were ready to work with irregular forces?—No, it would not, if they were going to have a regimental paymaster again.

19931. (Chairman.) But in order that you might have officers of the class that you want, and also the organisation necessary for the irregular forces, it would be desirable, would it not, to have a scheme drawn out beforehand?—Yes.

19932. Are you aware whether anything of that sort is being prepared as the result of the experience of the war?—No, I have not heard of anything of the kind.

19933. I have no doubt that you, from your experience in raising these regiments, would be able to give information?—I should be very glad to do so.

19934. Some officers have said that there ought to be a manual which could be put into the hands of any officer who was sent out, as you were, to raise a regiment which would be of great assistance to him in the matter?—Certainly it would, and there are similar forms in the Army Pay Department for working with an irregular force, but practically we had to adopt our own plan. We had our own idea of pay lists, and so on, and we have in the Constabulary quite a different system, which I think is much simpler and more understandable. A lot of officers never get to understand their pay accounts at all, and they could not keep them themselves, so they have to rely on their sergeants doing it.

19935. But in the case of some regiments that were raised (I do not think it occurred in your case, because, as you say, the rate of 5s. a day was fixed at the beginning) there were doubts as to the rate of pay; and conditions of that kind might be laid down in a manual, might they not?—Yes. I think in raising a corps like that standing orders are the first thing you have to get out, which I did at once; in fact, I wrote them on the voyage out, going into pay, and all that sort of question, so that I handed them to each officer and each non-commissioned officer, and he knew exactly what they were.

19936. And those could all be in print and ready to be handed out in that way?—Exactly; if there was a standard book of that kind, standing orders for raising irregular forces, it would be a great help, and, in fact, when they started raising other forces in Natal, Colonel Chisholme, who was the first to do so, with the Imperial Light Horse, sent to me, and I sent the whole thing down to him, and the Imperial Light Horse was started on the same principle. And other corps, Bethune's and others, took up the same sort of thing, so that there was a fair amount of uniformity about them. But that was only by chance.

19937. It was in the case of one of the Natal forces, Colonel Thorneycroft's Horse, that we heard that there was a doubt even as to the rate of pay?—Yes, it was just a chance matter whether they took it up or not.

19938. Then you have formed some deductions from your experience, which you have stated in your papers?—Yes, perhaps more from the working of Colonel Plumer's force and of my combined force after the relief when one was a flying column in the north of the Transvaal and afterwards again with the constabulary, working for nearly a year and a half, as we were, all over the country. We were all mounted infantry, but every day it was impressed upon us how necessary

it was that there should be cavalry; that cavalry are the most essential arm in modern warfare.

19939. Cavalry as distinct from mounted infantry, do you mean?—Yes, cavalry as distinct from mounted infantry. I am a great advocate for mounted infantry, too; I am a great believer in them, but I found the great necessity for good cavalry on almost every occasion.

19940. Would you explain that?—To begin with, the key to the whole of cavalry work is good horsemanship. I do not think it matters what the cavalry are armed with as long as they can bring their horses to the required spot at the critical moment. And the cavalry work is so distinct from mounted infantry work as they have to do the wide strategical moves rather than tactical moves. They have to undertake wide-ranging raids, much larger matters than the mounted infantry do, all of which demand perfect horsemanship; and that is not to be got by a roughly trained force in a couple of months; it is a matter of real experience and training. I do not say that we do it sufficiently yet in the cavalry, but it is in everybody's mind now; so far as I have been able to see the officers all recognise that now, and their main ideas are directed to getting their men trained in really practical efficient horsemanship. If you have a temporary trained force of mounted infantry, you can never train it to that amount of knowledge which is so absolutely necessary. And the work of mounted infantry is of a different kind; it is more for rapid tactical moves.

19941. The work of mounted infantry is to transport infantry at a rapid pace to the spot where it is required in battle?—Yes, whereas the cavalry have to make large turning movements to get round to the rear as it were, and take off the flanks of the foe. But, of course, in this war there were no cavalry opposed to us. In many another war it might be a different matter with the cavalry of the enemy coming down and stopping the mounted infantry doing their proper work. You must have a cavalry force capable of going long distances, so as to counteract the enemy's cavalry.

19942. So that it is necessary to be careful in the deductions which you draw from this war?—Yes, this war does not apply really; it only confirms a great many theories, which I formed before in that way. Only one sees now with the extended front that a battlefield can spread out to, what an enormous advantage it will be in the end to the force that has the best cavalry.

19943. You say that it does not matter what arm they have. I suppose you mean that they must shoot in any case?—They must shoot, and be able to hold their own, because the modern fight now differs very much from the old defensive attack. You have to grasp a position and hold it, and then another and another and another. You must keep on holding those positions as you go along creeping round the enemy, and you must be able to shoot as well as ride.

19944. You say that the steel arm, whether sword, lance, or bayonet must be sharp; do you mean that besides the rifle they ought to carry another arm?—I do not care much about that. I do not think it matters what they have.

19945. But do you think they ought to have one arm of offence, as it is called?—No, I think that a good sword bayonet, which you can use as a sword or as a bayonet, is as good a thing as anything. The present sword is a perfectly useless weapon to my mind, whether as a sword or anything else. I have been in two attacks now, and I have known of others where we have used the bayonet, not having any other weapon.

19946. The bayonet on the end of the rifle?—Yes, and it does perfectly well, because cavalry are very like artillery. They think they do much more harm than they really do, but it is the moral effect of cavalry with any kind of steel weapon which is what does the damage, and if it is a bayonet on a rifle, which you can balance as well as a lance (which is not the case at present), there is no reason why it should not be a very effective weapon.

19947. We were told by one witness that it would be almost impossible to get a sufficient balance to make a bayonet on a rifle an effective weapon, while others have said that it would be possible?—It depends upon the sort of weapon that you put on the end. And I do not think you want such very good balance. Using a lance in action is not a fine art; it is in drill and for competitions, and that sort of thing.

19948. (Viscount Esher.) I should have thought that

*Major-General
R. S. S.
Baden-Powell, C.B.*
19 Mar. 1903

if it is a question of moral effect, a lance or sword would have increased the moral effect of cavalry?—Well, I found that the best moral effect was shooting as you went along; that made the enemy turn and run before anything else. But as long as they know that you have some sort of steel in your hand ready for them, that is enough. As I say, a sword that you can use as a sword or fix as a bayonet is a thing I have in my mind. I have never tried anything else, because I found the ordinary bayonet fixed on the end of the rifle do very well.

19949. (*Sir Frederick Darley.*) What length should it be?—I should have a very short sword—longer than the present bayonet—double the length.

19950. (*Viscount Esher.*) Like the old Roman sword?—Yes.

19951. (*Sir George Taubman-Goldie.*) One witness said that he would rather carry a revolver than anything; would you agree with that?—No; I have tried a revolver, too, but a repeating rifle is better.

19952. I mean in addition to the rifle, in lieu of having a weapon of offence, carrying a revolver in your holster?—Yes, I have done that, too. I have expended all my ammunition out of the rifle and thrown it away, and then taken the revolver. Of course, it is very dangerous to everybody, but I cannot help thinking that if it is worked out (and it will be worked out in the cavalry) we shall find that a short sword with the rifle will do instead of the lance.

19953. (*Chairman.*) But it must be sharp?—Yes, it must be sharp; the present sword is not.

19954. (*Sir Frederick Darley.*) Would there not be a danger of losing the rifle if you used it as a lance; would there not be a danger of its being forced out of your hand?—No, I think not—not more than with the lance.

19955. But a lance has a sling on the arm?—You could put a sling on the rifle. You do not use the sling on the lance; it really comes out of itself.

19956. But you can drop the lance with it?—Yes, and so you could the rifle in the same way; it is only a matter of taking it round and bringing it up afterwards. But that matter of the weapon being sharp is a thing that really wants more attention in the Army. There are Ordnance objections to it, though I do not quite know what they are. In India I went into that with my regiment; we had so many men trained to sharpen their swords, trained by natives, because in India they are apt to keep their swords very sharp indeed; in fact, the Sikhs have a saying that a thing is "as disgraceful as having a blunt sword." I had one squadron which I always kept ready for service at two hours' notice in India, who sharpened their swords in that way, but the Ordnance came down and said I should have to blunt them again at my own expense. It is a high art, as it is with the razor, first to sharpen your sword and then to keep it sharp. The way to sharpen your sword is to grind it on various stones, and the way to keep it sharp is to keep it wrapped up in oiled muslin, and that sort of thing; but no soldier has any conception how to sharpen his sword or how to keep it sharp, and the whole success in a fight depends upon that. It is not that these Indians are such excellent swordsmen, but the fact is that when they hit you anyhow, the sword goes clean through what it touches, and so they disable you quickly, even with a half-cut or with a badly-delivered cut.

19957. (*Sir John Jackson.*) What is the objection to having the sword sharpened and kept sharp?—It wears them out too soon, before their proper life; it is a more expensive job.

19958. (*Chairman.*) One witness told us that in some of the frontier wars the regulation sword would not cut a poshteen?—No, it certainly would not as it is sharpened by us.

19959. You think that the cavalry sword ought to be able to do so?—Yes.

19960. (*Viscount Esher.*) Are you in favour of a cutting sword for the cavalry, not merely a rapier?—I think it ought to be able to cut, certainly. It ought to be very light and to be used with smacks. A smack may be anything; it depends upon how fast the man is coming at you, or you are going at the man; it may turn into a cut or a guard—it is the same thing really. I hope that will be the whole sword exercise in future; just to hold the sword properly and smack.

19961. But it should have an edge to it?—Yes.

19962. It should not be merely a rapier?—No, not entirely a rapier, but a light sabre.

19963. (*Chairman.*) Do you wish to say anything about field movements or field works?—Field works, I think, is rather an important point. We adopted a kind of field work of our own invention in Mafeking, which was evolved out of our experiences there when we first took up the defence of Mafeking. The usual way to see how much perimeter you are to hold according to the book is to take your garrison and see how many you have, and how many yards there are per man. Our perimeter would then have given, say, 700 yards per man. Our perimeter was, as a matter of fact, about six miles. We put little dots of forts all round the place, a circle of them completely round, and then an inner line of defence round the town itself, so that if the enemy took one of those forts or came within the circle, if he got between the forts and came in, he was in a much worse position than he was outside, because all these forts could fire inwards as well as outwards. Our book generally lays it down that field works should be made to face the proper front, wherever the enemy is supposed to come from; but nowadays nine times out of ten the enemy does not come from the proper front, so that you are apt to be taken in reverse, and I think that when a great many of those fortified camps were captured it was due to that—that the works were facing outwards in one particular direction, instead of in every direction. With field works made to face all round, the enemy have to take every single work if they want to hold the camp; if they take one it is no good to them, because the others are facing them and are turned on them. We practised that all the way through. We evolved a certain front called the "common sense" one, because it was either in the shape of a C or an S, facing in every direction back and front. And when we dug a trench we always dug it in the shape of an S or a C, and then you could fire in every direction, either front or rear, and the enemy never knew how to approach it. And it is very easily done; each man digs his 6ft. of trench, and then he can lie down in it and go to sleep in it, so that they can live in it, and then if they cover it in, it makes it absolutely impregnable, nobody can take it.

19964. What would they cover it with?—Any roofing material, poles or planks, or corrugated iron; and then a couple of feet of earth on the top of that. We found in practice also that it was a great protection against artillery, because, of course, it was very hard to hit. The trench is only standing about 3ft. above the ground, and if a shell strikes anywhere it may hit a man standing there, but it does not damage the rest. And then, again, the enemy coming up in the night cannot get in because you block up the door.

19965. How can you see out of it?—You put a long row of loopholes. We generally had them about 4ft. wide. The book lays down 4in., but I used to impress upon the men that that was a misprint for 4ft., because the bullets do not come in sideways; they are all dropping down at a distance. The only thing is to have a good wide parapet, so that the bullets do not come through and to have a narrow slit 6in high and 4ft. wide.

19966. Then is the ground outside at a lower level?—Yes; if there is grass or stuff that is likely to come up high, you must build the trench above it, and you must be guided by the nature of the ground for digging out—it may be soft ground or hard ground. I had a great argument with Lord Kitchener over the loopholes. The Army says they are to be small, and he asked me why we had these long narrow ones. I pointed out to him that if you are inside one of these forts when men are firing out of these little narrow loopholes you can just see out of them, so that each man can see a certain little bit of ground, but he sees no enemy; he hears his friends firing right and left of him all the way round, he does not know why and he gets frightened; it is like hearing an unexpected noise in a theatre; they all get startled, and a panic begins, and the men fire off their ammunition at nothing at all, and you have to surrender; but with those long loopholes they can see out in all directions, they can see what the enemy are doing, and, if necessary, if one part of the enemy are coming up against one fort, and another part are coming up against another fort, you can crowd a lot of men into one. I have had four firing out of one loophole instead of one.

19967. But does not that increase the danger?—Not if the loophole is low: the lower it is the better, because

Major-General
R. S. S.
Baden-Powell, C.B.

19968. (Sir George Taubman-Goldie.) 500 or 600 yards?—About 200 or 300, so that they could not miss him.

19969. (Chairman.) Do you think that the Boer trench was a good one?—A very good one indeed. There were several kinds of Boer trenches; those they brought up against us were not dug, as a rule, they were built up with sand bags; they were partly dug, but more built up than not. The men used to come out in the night, and they got up to Mafeking on the side where we least expected them, because there was one bit of perfectly flat, open, level ground where the racecourse was, and we thought they would never dare to come up over that. But that is just where they did come up nearest to us. But they came up in the night, each man carrying a spade and half a dozen empty bags. Then each man filled his six bags with sand, and in the morning there was a big trench up against us, made very much on our principle, too, long and narrow, but having very small loopholes, and we got at them in that way in the end. But it was a very effective way of pushing up nearer and nearer each night, by carrying empty sand bags, and they used to make very often a chain of little chambers, a little square box to hold two men. They would put half a dozen of those joining on to each other, so that if one went to rush one of those trenches and took a part of it, you had not got the whole trench, you had only got into one chamber, or if a shell went into one chamber it did not damage the rest of the trench.

19970. (Sir George Taubman-Goldie.) Who do you suppose devised those?—There was one German officer there certainly, whom we killed, directing all their parallels and zigzags. I think he had a hand in most of those forts—they were forts really. We had about 50 or 60 German officers against Mafeking.

19971. (Sir Frederick Darley.) What branch of the Service did that German officer belong to in his own Service?—I do not know. We killed him, not by a chance shot, because we laid for him, and got him. He was in khaki with silver fittings. I do not know whether it was an imaginary uniform of his own, or whether it was a German uniform. We only imagined that he was a German; he was a foreigner, because he was talking through an interpreter. We were so close up that we could hear him giving his instructions to an interpreter, who repeated them in Dutch to the Boers.

19972. I asked the question, because the infantry officers in Germany are all thoroughly trained in field entrenching?—Yes, he was very good at it, and very plucky, too.

19973. (Chairman.) You would like to have a light and extremely mobile gun?—Yes, that is what we felt the want of. I felt the want of it at manoeuvres long ago, and I had written in 1887 about it. I think I first suggested it to General Keith-Fraser, and he was very anxious to have it made then. I made out the working drawings of it all, and now Armstrongs have just made one of these guns, and I was going to try it with the Constabulary, namely, a 3-pounder gun on a light galloping carriage, that can always go on horseback or muleback, because cavalry work now is, and was even in all these raids, carried out chiefly by night, and you cannot take guns by night without letting it be known where you are going.

19974. This is to go on a pack saddle?—Yes, to accompany these rapid moves at night.

19975. With a range of 4,500 yards?—Yes, and it bursts shrapnel at 3,000 yards; it is very small shrapnel, of course, but it is effective.

19976. Has a gun of that kind been used at all?—They had some on the armoured trains, but I never heard with what result; they were not used in the field; they were naval guns, I think, on solid mountings. But I think that would be better than the pom-pom. The pom-pom is a very heavy gun, almost as heavy as the field gun to get round, and this one would be so very mobile, and it would be as effective, as far as fire goes, as the pom-pom, and rather more so, because it fires shrapnel, and you can get the shots in very quickly; it is light ammunition.

19976*. Had you any difficulties about discipline?—

No, nothing very bad. We found, for instance, sleeping at the post, which is a very serious crime, and we had no adequate punishment for it; it was rather unpleasant to have to shoot a man for it, but it was very nearly coming to that once when it began to get rather common. You can only give them a little field imprisonment, and that had no effect.

19977. You think that officers in these forces ought to have the power of dismissal?—Most certainly they ought to have power in that way.

19978. Did you have it yourself?—Yes.

19979. And did you exercise it?—Yes.

19980. During the siege?—Not then, but before the siege, and afterwards, if we enlisted a man we often dismissed him instantly; but that is no great punishment to a man; because he goes and joins some other corps if he wants to get money and so on.

19981. Have you any suggestion to make about punishment?—No, I cannot say that I have. We never devised any great punishments; we simply deducted something out of the men's pay, and paid them so much less at the end of their time. But that did not hurt them at the time, because we only paid them once a month, and money was no use to them in the field. We simply put up a bill of fines against a man and deducted them at the end, but there was no deterrent about it at all.

19982. That is a real difficulty in the case of service?—Yes.

19983. I see you would like to have a system of finger-prints registration, to prevent re-enlistment of undesirables in other corps?—Yes, we have been using that in a modified way in the South African Constabulary, and it is very useful; and I thought there might be some such system for the Army generally. We are adopting it now in our own Criminal Investigation Department out there, registering every criminal in the country, so that we know him now, and he cannot come up without being identified at once. I thought perhaps something of the kind might be done at the Central Registry for all recruits. I hear now that that has been gone into, since I made out this report, by a committee, because I suggested it to Lord Roberts when I was at home before.

19984. I suppose in those Irregular corps it would be very useful?—Yes, it would be a very desirable thing there, I think, if you were raising a corps in a hurry, but for ordinary army work it would prevent fraudulent re-enlistment through having people turned out of one regiment coming to another; it would be just as good as branding them, I think.

19985. With regard to saddlery, what was your experience?—We tried almost every kind of saddlery that was out there, I think, and we preferred the Colonial pattern, which is a very comfortable saddle, and gives very few sore backs compared with most kinds.

19986. The regulation saddle is too heavy, is it not?—It is heavy, and it gives a great many sore backs, too, and it is cumbersome, and carries a tremendous lot of kit; a man can strap all sorts of things on, and weigh himself down.

19987. It is a great thing with modern cavalry to reduce the weight on the horse?—Yes. The only drawback that I know in the Colonial saddle is that, buying them in bulk, you have to be careful in inspection, or you may get a lot of rubbish shot in upon you, because it takes a long time to inspect. It does not take to pieces like the military saddle, which you can see in parts in a moment. I had some saddles offered to me at one time by some maker, who opened each case and said "Just look in and see if they are all right." I took up the two top ones, and they were excellent. I took up the lower ones, and they were all shoddy, so I did not take any.

19988. Are there any other points that you have not touched upon, which you wish to mention?—There is one little point which I think I have omitted, viz., about the disposition for tactical work which it might be a useful thing for people to know. In teaching these men to work in the field it was very difficult to teach them proper formations for working in, because our drill book contains so many different kinds. If you are on an advance guard you have one kind of formation; if you are on rear guard you have another kind of formation, and if you are on outpost you have a third kind. There is no one principle guiding the whole lot. But I found it roughly effective to work always with units in a triangle or a diamond shape. If I had three units,

Major-General
R. S. S.
Baden-Powell, C.B.
19 Mar. 1903.

which was the usual way, I put one in front, one at the left rear, and one at the right rear, a little further back, so that I always had a triangle in every direction. The enemy might suddenly appear on the right, and then there was always a part of the formation there to meet them, and the other two parts took their places in support and reserve; and in the same way with a regiment, or even with three individual men; in that way you never got into trouble. The Boers would come and attack one of these forces, and the other two were ready to back it up. Very often we used to do it on purpose; we would put one part forward, and keep the other two out of sight in support and reserve. The Boers would make an attack on the leading force, and get all round it, and then the other two would come up and sandwich the Boers and catch them.

19989. Did that require more discipline in the men?—No, they knew of it, and it gave them much more confidence.

19990. But in order to keep their distances they would have to be well disciplined?—They get to understand it very quickly, and they knew it was the same right through for individual men or for squadrons, or for a troop. You could put an Army Corps in the same way, and move them seven miles apart, so that one part would attack and the others be ready to come up in a moment. And it answers well, too, if you want to put a few works out. We used to do it to stop the Boers coming through. In the South African Constabulary we never put a single line of forts (like the blockhouses), but we put a triangle of forts so that if they came past one fort they found themselves in a worse plight between two more, and it always worked most efficiently. And the same in camping your men; it is a great mistake to camp them all in one lump together, where they are liable to get rushed. If you camp them in three different places, then if one gets rushed the other two are awake by that time, and open fire on the first. It is a simple form where you have not the time to train them to all these other formations. Whether it is superior to those I do not say, I leave it to wiser people to judge, but I know it worked very well with us all the time. That was how I always used to do in peace before; but I was confirmed in it by its use in war.

19991. Is there any other point which you wish to mention?—I do not know whether you care to hear about our system of cornets, probationary officers, which we have been using in the Constabulary.

19992. If you please?—We have adopted a system there of promoting officers from the ranks, many from corporals, on a year's probation, as officers who become what we call cornets; that is to say, they receive a low rate of pay, and are to all intents and purposes officers, but they have the advantage of a year's probation as such, and during that year they have to pass all the different kinds of courses of instruction that we have. In our case they pass in Police law to begin with, then in pay accounts, veterinary work, drill, tactics, signalling, and, in fact, they go through all their courses while they are probationary officers. And then they are attached to different units during that time to be reported on by different officers as to their capabilities, and we have about half a dozen confidential reports on the same probationer from different officers.

19993. These are in the Constabulary?—Yes.

19994. They are not Army officers?—No. This is the way we recruit our officers there; but I thought it might be a good principle to apply, to give so many commissions in the year to rankers in the Army who pass a similar test, and at the end of the year you know exactly what the man is. He ought never to have to go back to any further courses. He passes an examination at the end of his year, and then becomes a second lieutenant.

19995. These men are men that serve in the ranks?—They have to serve in the ranks in the first year to know what they are like, and to become non-commissioned officers in that time—corporals. That shows that they are fairly good. Then, if they fail in the first examination, they go back for another six months' probation, when they have another examination, and then, if they fail again, they have to leave or go back and be sergeants again, which some of them do. But it worked very well with us. And also we grade the rank and file of the men, which I think is a thing worth considering at the same time; that is to say, a private, when he joins, is only a recruit; he is no use for practical purposes, so we put him on a low rate of pay until he has passed his recruit drills, when he becomes a third-class trooper; then he is a passed soldier, and

is just fit to take his place in the ranks. Then, if he chooses to qualify in signalling and various other things, learning Dutch and police law, he becomes a second class trooper, and draws extra pay; and if he further qualifies himself by doing so much tactics and drill, he becomes a first class trooper, with still further increased pay. That leads up again to corporal, and there again he becomes, in succession, third, second, and first corporal, and in the same way, third, second, and first sergeant, so that a man no sooner gets into one grade than he finds there is another just worth working for. I find that better than giving them extra pay. They might take the musketry course one year, or they might pass the signalling test another year. It is more on the principle that they work on in the Navy, I think, grading them like that.

Then there are details as to improvising armoured trains, but I should think that is not worth my going into, because there are so many ways of forming armoured trains now. We improvised them at the very beginning, long before the war broke out, out of improvised materials, sleepers, rails, and such things, and we used a good acetylene gas signalling lamp in Mafeking. We had no limelight to use, but we got hold of the acetylene. There was a traveller in acetylene who happened to be shut up in the place, and we got him to work with his sample of acetylene, and we found it worked the signalling lamp exceedingly well. We devised a little carrier for taking it on a horse, and we made up a lot of searchlights, too, with acetylene burners, which worked very well. They were nothing like so powerful as electric light, of course, but when you could get out in the field it was very portable.

19996. You could carry these burners?—Yes, we could carry them everywhere. We could put it up at night, and take a search round the country, and turn it out and turn it on again whenever there was an alarm. There are a great many of those small experiences that crop up from time to time, and one cannot remember them all; various dodges and ambushes and other things. Those, I think, are the points that I have down, but if there are any others that I could give, I should be only too pleased to offer them.

19997. (*Sir John Jackson.*) With regard to the secret service, do you think that at headquarters they made sufficient expenditure in that direction; would it not have been a great benefit if they had laid out more money in secret service?—Yes, I think so, long before the war.

19998. Not so much so immediately preceding the war?—We had fair information just preceding as to what movements the Boers were making, but as to what the total number of Boers was going to be we had no idea, nor what guns they had.

19999. I think you said that practically you had no funds for secret service?—No, we had not. We had practically tactical intelligence, and a little more than that. We heard all that went on at their meetings, that they proposed to blow up the bridges and the line, and attack Mafeking and take it, and part go down to take Kimberley, and so on.

20000. You think that there was an inclination on the part of the Government to spend too little money in secret service, perhaps?—I know from personal experience that it is so in a small way; but really I am not capable of speaking of that, because I do not know what they do spend. I can only judge by results; but we knew very little of what the Boer armament really was.

20001. You got the book, I suppose?—Yes, we got the book, which showed it to a certain extent.

20002. If more money had been expended in that direction, probably you would have had much better information?—Possibly; but I have been employed myself by the Intelligence Department on various jobs, and I know they do not bring forward much money to help you. They let you pay half your expenses and they pay the other half, which some people can afford to do; but it would be a great thing, and encourage people more, if they would pay all the expenses, and they would get a lot more information, I think, about foreign armies, foreign forts, and that sort of thing.

20003. (*Lord Stratheona and Mount Royal.*) What is the composition of the South African Constabulary; are there many Boers in it and many over-sea Colonials?—We have about 400 Boers, about 1,400 Canadians, and I should think about 400 to 500 Australians and New Zealanders. The Canadians, you know, were specially enlisted in Canada, but the Aus-

Major-General
R. S. S.
Baden-Powell, C.B.
19 Mar. 1903.

tralian Colonies declined to let men be enlisted in their Colonies.

20004. 10,000 was the original establishment, was it not?—Yes, 10,000; 6,000 our normal establishment, and 4,000 extra were ordered by Lord Roberts for the war and for the troublous times that would probably come just after the war, which we expected (but which really did not come) from bushrangers, cattle thieves, and people of that sort. There were a good number of them about, but we got them by their legs very soon.

20005. Are the Constabulary under ordinary military discipline?—It is not quite the same.

20006. They are trained as soldiers?—They are trained as soldiers, but act as policemen. They were all trained, of course, during the war, and took part in the war, but as soon as peace came they at once took up their duties as police, and now they are more trained as police than as soldiers. They have all the organisation of soldiers, so that at any moment they can turn into soldiers; but they are actually doing police work in small detachments all over the country.

20007. You consider them a good defensive force?—Very good, because they can at any moment be concentrated at any point, and they go through an annual course of military training, and their actual work fits them as much as any work for mounted independent work, because individual intelligence is developed to the utmost amongst them.

20008. It is not quite such a favourite service now with a good many of those who enlisted, I daresay, as it was when they had a chance of meeting the enemy in the field?—A certain class came there for fighting purposes only, I think; but the large majority are more of the class we desire, who want to settle down to be policemen and do police work. They like the life.

20009. But they are a very good body of men?—Very good indeed.

20010. Had you any over-sea Colonials with you at Mafeking?—Not during the siege; but directly after we were relieved a Canadian battery joined us, a capital

battery, and they continued with me all through the Transvaal.

20011. But they were not with you during the siege?—No. We had some New Zealanders and Australian bushmen in the Transvaal. I had three regiments of them. The Canadian battery were excellent. I had a British battery as well, but I liked the Canadian battery best; for one reason, they had not got any range-finders, and they found the range much quicker without them.

20012. You found them resourceful under the circumstances?—Exactly; that is what they were. They were much better than the South Africans in one way, namely, that they had never had native labour under them, and so they used to put their own shoulders to the wheel; they were the fellows to work.

20013. They had more individuality?—Yes.

20014. (*Sir Frederick Darley.*) Did you find the Australians resourceful in the same way?—Very much so. We used to have a lot of them missing always after a fight, and after the first fight I was very anxious, but very soon got out of that, because they always turned up again, perhaps after two or three days, and very often with a lot of prisoners. They used to hide away in the grass, and always found their way back.

20015. In regard to Sir John Jackson's question, were you not furnished with the list of guns that the Boers were supposed to have had, and which they had, in point of fact?—Yes.

20016. Before the war?—Yes; but we did not know much about the pom-poms.

20017. They were down on the list?—They were down on the list, but we had had no practical experience of what they were till we saw them.

20018. But they were on the list?—Yes.

20019. So that really there was pretty full information as to the position that the Boers were in before the war?—Yes; we were quite well informed in that way.

20020. (*Chairman.*) Is there anything else you wish to add?—I cannot think of anything at the moment.

Lieut.-Colonel A. J. GODLEY, Irish Guards, called and examined.

Lieut.-Colonel A. J.
Godley.

20021. (*Chairman.*) You have been good enough to prepare a précis of the evidence you will give which you will put in in the first instance?—Yes.

(A.) USE OF MOUNTED INFANTRY UNDER MODERN CONDITIONS.

Their rôle should be to support and form points of appui for the cavalry, or, in the absence of cavalry to take its place, in wide-reaching enveloping movements against the enemy's flanks and lines of communication, destruction of his railways, magazines, telegraphs, etc. To follow up vigorously any advantage gained by a rapid onslaught of the cavalry, to make good points of vantage and to form rallying points in case of reverse. To move rapidly to seize defiles, hold bridges, and forestall the enemy in commanding positions in front of the slower moving infantry.

In a rear-guard action they should be, and proved to be in the war, specially useful, using their fire-power and mobility to delay the enemy till the last moment.

They can be most usefully employed as escorts to artillery.

They should be trained as far as possible in the cavalry duties of scouting, patrolling and reconnaissance in order that they may be able to take the place of cavalry when the latter are not available, as was the case in the war.

(B.) THE FUTURE TRAINING OF OFFICERS AND MEN.

It should be done at schools of instruction, through which as many officers and men of the infantry as are at all suited for the work should be passed.

1. *Officers.*—For command at these centres, only small permanent staffs are necessary, and as many officers as possible should be passed through; as many young field officers as possible should be trained to command battalions of mounted infantry, captains to command companies, and subalterns to command sections—very young subalterns should not be taken. They

should be lieutenants who know their infantry work thoroughly, and show an aptitude for mounted infantry work. Training is much delayed now by young officers being sometimes sent who not only have no aptitude for the particular work, but have to be taught purely infantry work, which they should know before they come.

No captain should command and train a mounted infantry company till he has been attached for instruction first to a company of mounted infantry. Similarly, no field officer should command a battalion of mounted infantry unless he has commanded a company first, and commanded it particularly well, and the selection of officers commanding battalions should be in the hands of the mounted infantry authorities.

Some infantry commanding officers seem to think it necessary to select only light-weight officers for mounted infantry. This is a mistake. Weight is no bar to an officer if he has aptitude for the work.

2. *Selection of Men.*—Men selected for mounted infantry should be efficient infantry soldiers, active, good shots, and as light as possible, but a good comparatively heavy man, who knows his infantry work, is better than an indifferent light one. Very often a tallish man of 5ft. 10in. is no heavier than a little "butty" one of 5ft. 5in., or 5ft. 6in., and he will probably ride better.

In selecting men for mounted infantry, steadiness, good character, intelligence, and good shooting are of far more importance than weight (within reason).

3. *Period and Duration of Training.*—Men as long as they are serving should, if possible, come up for mounted infantry training once annually for a period of three months. This in the case of three years' men, will mean that a man, if he is to do more than one training, must come up after he has done only nine months' or one year's service, i.e., probably before he is an efficient infantry soldier, and after his second training he may go to the Reserve at once, but this does not matter, as, on mobilisation, he will join mounted infantry if required to complete the quota to be furnished by the infantry battalion.

4. *Reservists.*—If possible, a scheme for calling out mounted infantry Reservists for training would be an advantage, though not so necessary as may be thought, as a man well trained during his service will never forget the teaching.

5. *Farriers and Saddlers.*—Men must be trained in large numbers for these duties. There was a great dearth of them in the war.

6. *Shooting.*—Time should be found during the training for musketry, and extra ammunition allowed for it. A man may be a good shot ordinarily, but even riding to the range may put him off, and there should be as much practice as possible with the men galloping on the range, dismounting quickly to fire, mounting again to go to the next range, and so on.

No man should be given a mounted infantry certificate unless he has proved himself during the mounted infantry course able to combine good shooting with riding.

7. *Horsemanship.*—The idea that a mounted infantryman should only be able to ride well enough to get from place to place without accidents is a bad one. He should be able to ride as well as any mounted man. To ride in extended order and in a rearguard action really good riding is a necessity.

8. *Horsemastership.*—Requires more training of both officers and men, not only in stable management but in the care of horses in the field, the studying of the different constitutions of the horses and the best methods of feeding them with different kinds of forage. Veterinary officers should treat minor ailments in troop stables. Only those cases which are very serious or infectious should be taken to sick lines or special veterinary establishments, so that all officers and non-commissioned officers should get a knowledge of how to treat ordinary ailments and of the ordinary remedies.

9. *Open Training Ground.*—For proper training really open ground is most necessary, and a large extent of it, where men can ride at a gallop in large bodies in extended order over rough ground.

10. *Uniformity of System.*—A uniformity of system of training at the various centres is most necessary, and should be ensured by inter-communication and occasional, not necessarily frequent, visits of inspection by an Inspector-General, or the senior of the commandants of the schools, with inspecting powers.

11. *Miscellaneous.*—Satisfactory methods of carrying the rifle and of disposing of the led horses so as to get 100 per cent. of rifles into the firing line require a great deal of attention.

(C.) THE BEST ORGANISATION AND EQUIPMENT OF MOUNTED INFANTRY.

Various Systems of Creating a Mounted Infantry Force.

1. *Permanent Battalions.*

Advantages:—

- (a) Men possibly better trained.
- (b) Commanding officers of Infantry battalions do not have to part with any of their officers and men, either for peace training or on mobilisation.

Disadvantages:—

- (a) The creation of a special arm.
- (b) There can only be comparatively few, on account of the expense.
- (c) The danger of the men losing their Infantry characteristics and becoming indifferent Cavalry.
- (d) The burden to the State of keeping up a large permanent mounted force for the use of which the opportunity may never come; when results perhaps just as good, and a far larger mounted force, can be obtained by training as many of the Infantry of the Army as possible as Mounted Infantry, ready for use as such when the occasion arises.

2. *Training of Officers and Men with their Infantry Battalions.*

Advantages:—

- (a) Separate accommodation not required for the men.
- (b) Commanding Officer of Infantry battalion does not have to part with his officers and men.

Disadvantages:—

(a) Infantry Commanding Officer may have no knowledge of Mounted Infantry work or care of horses, nor may the officers selected by him to train the men, and he has already plenty to do in command of his battalion. Possibly, therefore, bad Mounted Infantry instruction and bad horsemastership.

(b) No uniformity of system.

(c) Smallness of the Mounted Infantry unit trained; at most each Infantry battalion could only have cobs for one company, and the expense of building stabling for these to each Infantry barrack would be enormous.

(d) Scattered stables, rendering proper supervision by higher Mounted Infantry Commanders impossible.

(e) Want of enough open ground for mounted work at all Infantry stations.

3. *Collection of Officers and Men to be Trained at Central Stations or Schools of Instruction.*

Advantages:—

(a) Uniform system of training under Mounted Infantry commandants of proved experience.

(b) Training carried out in large bodies.

(c) Officers trained to command large bodies.

(d) Less expense to the public by building all stabling together.

(e) The majority of the Infantry of the Army are passed through the schools and trained in Mounted Infantry work, riding, and the care of horses.

(f) The men returned to their battalions better Infantry soldiers.

(g) The number of the Infantry of the Army is not lessened, but as many as are trained in Mounted Infantry work are thereby made more useful and ready to be mounted when occasion arises. On mobilisation the strength of the available Infantry remains the same, those used as Mounted Infantry being so many extra.

Disadvantages:—

(a) Officers and men taken away from Infantry battalions for peace training.

(b) It is said that on mobilisation the Infantry battalion loses 143 (the strength of a Mounted Infantry company) of its best men, but this is not so, as many of these men will be Mounted Infantry Reservists, and the remainder will be replaced by calling up enough extra Reservists (possibly better men) to make up the battalion to its war strength.

Organisation.—One-eighth of the infantry of the Army should be mounted infantry.

They should be mounted on cobs, not horses.

Peace Training.—This system of training schools to which every infantry battalion sends a certain number of officers and men—a section (one subaltern and 35 men) at a time—to be trained for three months is the best. These are grouped into companies and battalions for training. On completion of training this section is replaced by another; therefore at the end of a year the infantry battalion has a company of mounted infantry trained.

Mobilisation.—On mobilisation, this company of mounted infantry, consisting of officers and men from the same infantry battalion, would be called up. During the war mounted infantry battalions were often composed of detachments from 16 or 18 infantry battalions, and infantry battalions had to furnish detachments to more than one mounted infantry unit, and it was found by experience that the officers and men of a mounted infantry company should all come from the same infantry battalion. This, in an Army Corps, of 24 infantry battalions (three divisions, each of two brigades, each of four battalions) would give 24 mounted infantry companies.

Four of such companies make a mounted infantry battalion, which gives six mounted infantry battalions. These should be organised in two mounted infantry brigades, each of three battalions. One of these battalions should form part of a cavalry brigade in the same way that the battery of Horse Artillery does; the remainder to be at the disposal of the Army Corps.

commander for use as a large independent body of mounted men, as he may require them, perhaps in conjunction with a cavalry brigade, perhaps with the infantry divisions. They should not be distributed to infantry divisions or brigades, nor used as orderlies, scouts, etc., nor for the protection of infantry brigades or battalions.

It was always very difficult and often impossible to move mounted men during an engagement from one part of the field to another under long range gun and rifle fire, which disposes of the theory of placing mounted infantry at the disposal of the officers commanding infantry attacks, to move quickly to reinforce and support threatened points, drive home attacks, make local flank attacks, etc.

This will give a force, according to the present establishments of mounted infantry, of 3,500 mounted infantry (a mounted infantry battalion is nearly 600) to each Army Corps, which means that each infantry division has over 1,100 men taken from it and mounted, for use by the Army Corps commander independently of it. Of this 1,100 it must be remembered a proportion would be Reservists, and the remainder would be replaced by calling out enough more Reservists to make the divisions up to war strength.

Guns.—Pom-poms for use in advanced guard actions, and Maxims for defensive positions and points of appui should be attached to all bodies of mounted infantry, and brigades will require Horse Artillery.

The War Establishments.

Of (1) a battalion, (2) a company of mounted infantry require to be laid down. A higher establishment than that now laid down for peace training is desirable in both cases.

Equipment.

On the Man.—Should be as light and simple as possible. The rifle should be carried slung on the man. His breeches should be loose. Putties are preferable to leggings. Beyond his rifle and clothing, he should only carry ammunition, bandolier, and belt, with bayonet, haversack (one day's food), and water-bottle.

On the Horse.—Bridle complete (one rein.); head rope; well-made Colonial pattern saddle, with girths, irons, and leathers (no breast-plate, wallets, surcingle, or shoe case; blanket under saddle (for man's use).

On Saddle.—Cloak, wire-cutters, mess-tin, iron picketing peg, nose-bag (one day's forage),

Everything else in some form of light-wheeled transport.

20022. You served in South Africa, I think?—Yes.

20023. Would you say what service you saw there?—First in assisting to raise, train, and equip a regiment of Colonial mounted infantry, the Protectorate regiment—one of the regiments that General Baden-Powell raised before the war; secondly, in command of the western defences of Mafeking during the siege; afterwards as General Baden-Powell's and General Plumer's staff officer successively; and, lastly, in command of a brigade of mounted infantry which was made up of these regiments that had been raised before the siege and of the British South African Police.

20024. And what position do you hold now?—I am commanding the mounted infantry of the First Army Corps.

20025. At Aldershot?—At Aldershot.

20026. Then it is with regard to mounted infantry in particular that you can speak from large experience, both in the war and since?—Yes.

20027. I suppose you draw a distinction between cavalry and mounted infantry?—Yes, a very marked distinction. I think that all mounted infantry officers who have studied the subject do.

20028. Could you give any distinction?—I only ask the question because in your notes here you say that, "Their rôle should be to support and form points of appui for the cavalry, or, in the absence of cavalry, to take its place." That does not mean, I suppose, that they should be able to act as cavalry?—No, but you have that number of mounted men, and if, as may so often happen, and did happen in the war, the cavalry are not available, it must be a great advantage to have these mounted men, trained as far as it is possible to train them, to take the place of cavalry as a screen in front of an army or for reconnoitring. Of course, they could not in any way use an *arme blanche*, because they would not be armed with one, but in the duties of pro-

tection for an army marching, the mounted infantry should, as far as possible, be trained to take the place of cavalry when the cavalry are not available.

20029. Oh, yes; I wanted to make it quite clear that you did not want the mounted infantry to have cavalry training?—Most certainly not.

20030. Or a cavalry arm, if the cavalry is to have a sword or a lance?—No.

20031. Do you not want the mounted infantry to have any arm but the rifle?—And the infantry accessory, the bayonet.

20032. A bayonet so made as to act as a spear, do you mean?—No, as purely infantry equipment.

20033. Only to be used when the man is acting as an infantryman?—Yes.

20034. Not to be used on his horse?—No.

20035. You do not think that is necessary for mounted infantry?—No, though I believe in Matabeleland in 1896, upon one occasion the mounted infantry did fix bayonets on horseback, and made a kind of charge, which had great effect in frightening the natives.

20036. We have had some evidence that at the later stages of the war the Boers came to closer quarters because they found that our mounted men had no arms but the rifle, and could not charge. Did you see anything of that?—No, I did not.

20037. But anyhow, a mounted infantryman, in your opinion, should not be trained for anything like a charge or shock tactics?—No.

20038. (Lord Strathcona and Mount Royal.) Could not the bayonet be contrived so as to be useful in either case, by mounted infantry when mounted, or when acting on foot as infantry?—I think it would be very difficult, because at the end of a rifle it is a very clumsy weapon to hold in any way like a lance. If you have a rifle and a bayonet, you require both hands to hold it. You could not take it in one hand and use it as a lance, it would be too heavy, and if you made it long enough for use as a sword I think it would cease to be a bayonet; practically it would become a sword.

20039. I think the bayonet has been proposed by some for the cavalry as preferable to the sword?—Then it would be something of that nature, I presume.

20040. (Viscount Esher.) Then I suppose you would lay special stress upon not altering the infantry equipment merely because you are using the infantryman as a mounted man; that is your point?—Yes, that is my point.

20041. Whatever arm may be in future selected for cavalry, it would not affect your opinion?—No; that would not affect my opinion at all. The mounted infantryman should be an infantryman first, and be equipped as such.

20042. (Sir Frederick Darley.) But with a horse to bring him to his position with rapidity?—Yes.

20043. (Chairman.) Is there anything you wish to add to the note (B) in this paper as regards the future training of officers and men?—In the third paragraph, "Period and Duration of Training," I say there, "This, in the case of three years' men, will mean that a man, if he is to do more than one training, must come up after he has done only nine months' or one year's service, i.e., probably before he is an efficient Infantry soldier." If you compare that with the second line of the paragraph above that, paragraph 2, they appear rather contradictory, because I say there that "men selected for Mounted Infantry should be efficient Infantry soldiers," and it is most important that they should be; but with three years' men we have to face the alternative of either waiting so long for them to be efficient Infantry soldiers that then there is practically no time to train them properly as Mounted Infantry, or else we must take them before they really are efficient Infantry soldiers. We could not afford to lose the three years' man as a Mounted Infantryman; we must take him, and do the best we can with him; and therefore, I think a solution would be to take him after he has only done one year's service as an Infantry soldier, so as to give him two Mounted Infantry trainings before he goes to the Reserve.

20044. (Viscount Esher.) Then your idea is not to pass a very large number of men per battalion through a Mounted Infantry course, but, as I understand, your suggestion is to take the same men two years in succession. Is not that so? I did not quite understand

that paragraph No. 3. Is that what you mean?—Yes, that is what I mean. There again, the alternatives are either of passing a very large proportion of the Infantry of the Army through with a very slight and short Mounted Infantry experience—that is only one training if you did not allow them to come up again—or training a fewer number, and, by bringing them out annually, like a Militia training, having that number kept in practice for Mounted Infantry work, and therefore more efficient.

20045. Which do you think is the better system?—I think to bring them out as far as possible annually for training.

20046. (*Lord Strathcona and Mount Royal.*) No matter what the size of the man is, you prefer having them not more than 11 stone or so—not heavy men?—Not really heavy men; but, as I have said, I would rather have “a good comparatively heavy man than an indifferent light one.”

20047. (*Chairman.*) Does that mean that when you select your infantryman for mounted infantry work he is to come up in each of his three years for three months' training?—I think in the case of the three years' man he certainly ought to come at least twice during his three years before he goes to the Reserve. I do not think once would be sufficient, and in the case of a man who re-engages for longer it would certainly be advantageous if he came up regularly every year after his three years were up. A system might be worked out by which he should then come up perhaps every alternate year, but I certainly think he ought to keep on coming up. He ought not to do only one mounted infantry training and then go away and not come again. It requires practice. A man should be brought up for practice in the work as often as he can be consistently with training a sufficiently large number.

20048. That would mean that the mounted infantryman in the battalion would never be more than nine months with his battalion in any year?—Yes.

20049. (*Viscount Esher.*) Can you be sure of getting again for this year's annual training the men that you got last year?—You cannot ensure getting them at home, but then you can ensure getting them in some part of the world. A man you train this year at Aldershot may next year have gone to India, but if the system is made universal throughout all our dominions and mounted infantry training goes on everywhere, then it does not matter whether a man is trained in India or at Aldershot.

20050. (*Sir John Edge.*) He would only get three months each year?—Yes.

20051. In your course is horsemastership included?—Yes.

20052. (*Chairman.*) And you would wish to bring out Reservists too?—It would be a very great thing, and for the same reason that it would keep them in practice for riding and looking after their horses. But that would be a very large question of principle, and a man who gets a good grounding in riding and looking after horses never forgets it. With regard to the Reservists that had previous mounted infantry training, and were used as mounted infantry during the war, I never heard any complaint of their failing in any way either in riding or in looking after their horses. They had remembered what had been taught them.

20053. It would be a new principle to bring out the Reservists?—Yes.

20054. (*Lord Strathcona and Mount Royal.*) You would have him as a horseman to approach in efficiency a cavalry man?—As a horseman he cannot ride too well. I think it is a most dangerous theory that he “should only be able to ride well enough to get from place to place without accidents.”

20055. Then he would be useful with an army where there were no cavalry present to support it?—Yes.

20056. Then he would act as cavalry to a certain extent?—Yes, under those circumstances.

20057. (*Chairman.*) It requires also some training in the matter of musketry in your opinion?—Yes. A man who is unaccustomed to horses may be a very good shot when he is perfectly steady after he has walked quietly down to a range to shoot in peace time, or even in time of war as long as he is on foot, but if he has to gallop up to the position from which he has to fire, and is

consequently excited and his nerves perhaps shaken, his shooting may possibly be very different.

20058. It is not that you want him to fire from the saddle?—No; but I think as regards that, it might be useful in exceptional circumstances to train a certain proportion of men to do it—men who are particularly good shots, and for whom particularly steady horses can be found. There are times when I believe it might be valuable.

20059. (*Viscount Esher.*) Have you ever tried training any of your own men to shoot from the saddle?—Yes, we have tried it, but not to any large extent. I have tried it with a certain number of men.

20060. (*Sir George Taubman-Goldie.*) Have you found any considerable proportion capable of doing that?—Not very many. It is a thing that would require a great deal of training, and I think it depends almost more upon the horses. At home, with a corn-fed horse that is very much above himself, it is very difficult; but if you get a quiet South African shooting pony that is accustomed to firing from his back it can be done. But it is very often said to be rather the refuge of an undisciplined man to fire off from his horse's back, and consequently it needs to be approached with caution.

20061. I do not quite understand. What is the “refuge of an undisciplined man”?—To fire off his horse instead of dismounting to take up a proper position from which he can lie down and fire steadily. If you train all your men to fire off their horses it is possible (I do not say it would happen) that instead of dismounting from their horses to take up a proper position to fire steadily, the men might lose their heads and begin firing off their horses at random.

20062. (*Chairman.*) Do you give a certificate to a mounted infantryman now?—Yes, every man who proves suitable for the work gets a certificate.

20063. Was that in force before the war?—Yes, it has been since 1888.

20064. Of course, there were a good many mounted infantrymen in the war who had not had a certificate?—A very large number. I think a large proportion.

20065. Is that a certificate that they are good in horsemastership?—Yes.

20066. That is an important point?—Very.

20067. Was not that defective during the war?—Yes, very, at the beginning, and I think in the case of the mounted infantry chiefly, as you have said, because so many of the men had no previous mounted infantry training or certificate.

20068. Does it not depend a good deal upon the officers?—In my opinion, the proper training of the men in horsemastership depends entirely on the officers. I think it is entirely a question of the superintendence of the officers—in fact, you might say, of discipline almost, and the proper teaching of the men. If you get it thoroughly imbued into the men by very careful superintendence by the officers, and very careful training of them as regards the horsemastership, it may then become second nature to the men to do what is right.

20069. All through the officers would have to keep up a careful superintendence?—Yes, certainly. I do not mean that they should relax their superintendence, but, still, when the occasions do arise, in which officers may not be able to exercise a constant superintendence, I hope that then it may have become second nature to a man to do what is right in looking after his horse.

20070. But during the war I suppose the officers, as well as the men, were in many cases deficient in that knowledge?—At the commencement, very.

20071. Are the officers now being trained sufficiently to meet that point?—So far as mounted infantry training is being carried out at all now, they are, but really the only mounted infantry training going on to any extent now is at Aldershot.

20072. (*Viscount Esher.*) What means have you there of giving your young officers or men any idea of veterinary knowledge?—There are no really satisfactory methods, at present. I make a suggestion here that, if possible, veterinary officers should treat ordinary and minor ailments in the troop stables, so that the officers and men would see what they were doing. I think that would be a very great advantage. As it is, an animal that has anything the matter with it is taken away to sick lines, or to a special veterinary establishment,

*Lieut.-
Colonel A. J.
Godley.*

19 Mar. 1903.

Lieut.-
Colonel A. J.
Godley.

19 Mar. 1903.

to which I encourage my officers to go and see the treatment that is being given to the animal. But it is a little bit difficult sometimes; there is the possibility of interference with the veterinary officer's management of his veterinary establishment. I do not think it is likely to produce such good results as if the more ordinary minor ailments, which it is really essential that an officer should know how to treat, were treated under his eye in his own stable.

20073. Then somebody must teach the untrained infantry officers even to cope with those minor ailments?—Yes.

20074. You have not a veterinary officer, have you, attached to your mounted infantry lines at Aldershot?—There will be.

20075. But had you one last year?—We have always had a veterinary officer looking after our cobs, but owing to scarcity of veterinary officers, he has had to look after other animals as well. That is only because of the scarcity. Previously there was always a veterinary officer with the mounted infantry, and there always will be for the future.

20076. (*Lord Strathcona and Mount Royal.*) If it were distinctly understood that it was one of the duties of officers to become acquainted with what horsemanship was, and it were included in the regulations of the Army, there could be no difficulty?—No, I think it is understood. Certainly all my officers are encouraged and told to endeavour to learn all they can about horsemanship, but my contention is that it is more easily said than done at present, and my suggestion to meet it is that more treatments should take place in troop stables, under the officer's eye, of the ordinary minor ailments of the horses, so that he may get to learn the ordinary and simple remedies.

20077. You would have it become an obligation that it should be so?—Yes.

20078. (*Chairman.*) Do you confine that to the officers told off for mounted infantry work, or would you like it throughout the Army?—I think, throughout the Army.

20079. (*Sir Frederick Darley.*) Are officers taught to shoe, how a shoe ought to be put on?—Yes, the same thing applies to that. At present there is no very satisfactory system laid down for their doing it (I speak, of course, of the mounted infantry), but I hope, when we get my particular training school into the larger dimensions that it is going to assume, we shall get some more satisfactory system for the actual teaching of the officers.

20080. (*Viscount Esher.*) It is quite within your competence, is it not, to order all your young officers who come to you for training to be instructed in, say, shoeing horses?—Yes.

20081. You can give that instruction, if you please?—Yes.

20082. (*Sir Frederick Darley.*) Nothing is more important in horsemanship than knowing how a horse ought to be shod?—Nothing.

20083. (*Lord Strathcona and Mount Royal.*) No officer could have equal influence with his men in making them good horsemasters unless he were acquainted with it himself?—Exactly.

20084. (*Chairman.*) Then you want a uniformity of system?—Yes, I think that is extremely important; not so much in the case of peace training, but because it may conceivably happen that if a large number of mounted infantry were required in time of war, on mobilisation, they might come from different training centres and be put to work together, and if they had been trained on different systems at the different centres, the results, when they were amalgamated, would not be so good as if they had all been trained on a uniform system.

20085. Has there not been uniformity hitherto?—No, not in all cases.

20086. How far can there be differences?—Well, they are differences of standard almost more than anything. The standard at one school may be very much higher than at another.

20087. The standard of efficiency?—The standard of efficiency, and also the methods of mounted infantry tactics. The commandant of one training centre or training school may hold rather different views upon certain points from the commandant of another one.

20088. But we have had a good deal of evidence as to

the value of initiative of the individual officer; is there not something of that in the training of mounted infantry?—Yes, I would not wish in any way to fetter that, but there are certain principles of mounted infantry training which, from what I have seen myself at out stations which I have been sent to visit, have not been carried out (certainly it was during the war), because the officers who were responsible for the training had not had a proper training themselves to begin with. But even now I think that in the broad principles of mounted infantry training uniformity of system is very necessary.

20089. (*Sir George Taubman-Goldie.*) Has no handbook been issued?—There was a Provisional Handbook published in 1899, but there has been nothing since.

20090. (*Viscount Esher.*) But the way you deal with that, I suppose, is by inspection?—Yes.

20091. Your suggestion is that the various outlying training camps, and so on, should be properly inspected by some one officer, whose business it should be to do it?—Yes.

20092. Do you know whether in the Second or Third Army Corps they have mounted infantry schools?—The Second Army Corps will have a mounted infantry school on Salisbury Plain, and the Third Army Corps at Kilworth, in the south of Ireland.

20093. Are they established yet?—No.

20094. Not the Salisbury Plain one, but the Irish one?—No, neither.

20095. Then yours is the only mounted infantry school on anything like a large scale?—Yes. The others are, I believe, to be established as soon as possible this summer.

20096. Then, what were you referring to just now, when you said you visited other mounted infantry establishments?—During the war there were men trained at Shorncliffe, Colchester, and Manchester.

20097. But they have dispersed now?—Yes.

20098. (*Chairman.*) Then, as to the organisation, there is more than one method of doing that?—Yes.

20099. I understand from this statement that you do not contemplate a permanent battalion?—No.

20100. You think that is an unnecessary burden in the meantime?—Yes, that is one of the reasons.

20101. What other reasons are there?—I think, perhaps, the most important of all is the creation of a special arm, a fourth arm, which that would mean. You would have cavalry, infantry, and artillery, and then you would have another arm altogether—mounted infantry.

20102. And that would be a disadvantage?—I think so.

20103. Then if that is not to be done, there is the alternative of training men with their battalions or in schools of instruction?—Yes.

20104. Which alternative do you advocate there?—The collection at central stations or schools of instruction.

20105. Would you just say shortly what is the main reason for that?—First of all, the uniformity of system and of standard which you would get under mounted infantry commandants who proved to be capable of training men. Then the training would be carried out in large bodies of mounted infantry; you could train officers to command large bodies. The majority of the Infantry of the Army would be passed through the schools and trained to look after horses, and in mounted infantry work generally. The men are undoubtedly better as infantry soldiers for the mounted infantry training. And it really gives more infantry in the Army, of which a certain number would be mounted, because the men called up on mobilisation for training as mounted infantry would be in excess of the infantry establishment. The place of the men that were taken away from the battalion for mounted infantry would be filled by calling up so many more reservists to make the battalion up to its war strength, and similarly other units.

20106. For peace training it diminishes the establishment of the battalion?—Yes.

20107. And that is the main objection, I suppose?—That is the main objection; that officers commanding infantry battalions have to part with a certain number of the men for their peace training as mounted infantry.

20108. (*Viscount Esher.*) But only for three months in the year?—No, all the year round.

20109. You propose to train mounted infantry, do you, in winter as well as summer?—Yes.

20110. (*Chairman.*) You would have them by instalments from the regiments?—Yes, a section—that is, a subaltern officer and 35 men—at a time. Every infantry battalion would always have away from it a subaltern officer and 35 men undergoing training as mounted infantry; they would always be that number short of men, the alternative being to call out a whole company from a battalion for training as mounted infantry for only three months; instead of calling out a quarter of the company the whole year round, to call one company for three months. But I think the majority of opinions are that it would be harder upon the commanding officer of an infantry battalion to take away so many as 140 men for three months than to always have 35 men away the whole year round. And it would not work equally. The commanding officer who had to send his 140 men in the winter months would have no objection at all, but the commanding officer who had to send his men from April to June, or during manœuvre time, from July to September, would look upon it in a very different light when he had to go to manœuvres with his battalion denuded by 140 who were away for mounted infantry training.

20111. (*Viscount Esher.*) At manœuvres do you propose that the mounted infantry should be used as they would be in war time? Under your scheme for forming battalions of mounted infantry, would you propose that they should be formed for the purposes of manœuvres as well?—They would be in existence.

20112. And used as such?—Yes.

20113. They never have been, have they?—Yes, occasionally on manœuvres.

20114. (*Chairman.*) And the result would be that one-eighth of the infantry of the Army would be mounted infantry?—Yes, on mobilisation, but only one-thirty-second (*i.e.*, the training-battalions) for peace training or manœuvres.

20115. Or 3,500 men to each Army Corps?—Yes, on mobilisation.

20116. (*Viscount Esher.*) This autumn, if you have your Army Corps manœuvres at Aldershot, do you suppose you will then have your 3,500 mounted infantry?—No, we shall only have a peace training nucleus; we shall have only 1,000 men.

20117. That is exactly what I meant. Then you would not be able to organise for the purposes of manœuvres that full mounted infantry force which you are referring to here?—No, because that is entirely a mobilisation scheme; but there will be two training-battalions of mounted infantry in both the First and Second Army Corps available for use as mounted infantry.

20118. Two battalions in each?—Two in each Army Corps.

20119. (*Chairman.*) And the war establishment will be the whole number taken from all the regiments?—Yes.

20120. And you maintain that number on mobilisation would be made up to the regiment from the Reserve?—Yes, from the Reserve.

20121. And if you have to supply casualties or want more mounted infantry during the war what is to happen? Would you draw upon the regiments?—Yes, because there would probably be left in the regiment (I hope there would be) a certain number of mounted infantry reservists. Of all the reservists that came up a certain number would have been trained as mounted infantry, and the mounted infantry reservists, so far as they would be required, would go to the mounted infantry. But among the reservists of the infantry battalions there would still be left men who had been trained as mounted infantry.

20122. And you would consider that you had the first call upon them?—Yes.

20123. Would that not be rather hard upon the regiment?—Not appreciably, as there would be still more reservists to call upon. As casualties were to be replaced reservists would keep on being called out, and of these we should expect to get to the mounted infantry those who had been trained as mounted infantry.

20124. Was it not the experience of the war that some regiments, at any rate, had very heavy calls for their best men to be taken away from them for mounted infantry work?—Yes, it was, but the scheme had not then been elaborated in the way it has been now, and I do not think that any battalion would find it so hard to send one company of mounted infantry to the mounted infantry organisation and to replace casualties in that company to keep it up to its proper strength, as to send detachments, as it was called upon to do during the war, not only to its own company with the mounted infantry battalion, but to various other mounted infantry organisations and units. An infantry battalion was called upon to send mounted infantry in small detachments of a section or larger detachments of a company to many mounted infantry units and organisations instead of only to one as it would be under this scheme.

20125. That was the practice during the war, was it?—It obtained to a very great extent; of necessity infantry battalions were called upon to send men for use as mounted infantry.

20126. (*Sir George Taubman-Goldie.*) And that necessity might arise again even under your system?—It would not arise if the numbers were kept to the numbers which are laid down in this system; you would know then exactly how many men would be wanted, and what the force of mounted infantry was going to be. It could not arise unless it was decided to increase the mounted infantry.

20127. (*Viscount Esher.*) There was no system, I suppose, before?—There was no system on any large scale.

20128. It was perfectly haphazard as to the numbers of mounted infantry which were selected?—I think as the war went on and the requirement of mounted infantry was found, so the authorities kept on calling upon infantry battalions to furnish men to be mounted.

20129. (*Sir George Taubman-Goldie.*) And that might happen again?—Except that you would have this large force to start with.

20130. What do you allow for the percentage of wastage of war in one year? Have you calculated that?—No.

20131. We have had evidence on that point?—

20132. (*Sir John Hopkins.*) And those men that were called upon were passed through as mounted infantry in their regiments?—Yes.

20133. So that they were liable to be called up in that direction? What I mean by that is that if you call upon a regiment to supply a certain number of men—say it had trained 300 of its men as mounted men—they were all liable to be called upon?—To replace casualties as they occur. But under this scheme the infantry battalion knows that it starts at the commencement of the war with having to supply 143 men, and it knows that throughout the war it has to keep that 143 up to strength—it has to replace the casualties in that 143 and no more.

20134. But before the training might have extended to 300 men?—Yes.

20135. (*Lord Strathcona and Mount Royal.*) What is the complement of an infantry regiment at present on war strength?—1,012.

20136. And what is proposed to be the complement of a mounted infantry regiment?—600—a little under 600. With an infantry battalion of 1,012 its contribution to the mounted infantry is 143.

20137. Out of the 1,012?—Not exactly out of it, because it furnishes the 143, but the place of those 143 is taken by calling out extra Reservists to make up the infantry battalion again to its 1,012.

20138. (*Viscount Esher.*) You never have, in point of fact, at Aldershot seen mounted infantry brigaded with cavalry, have you?—Yes, and in 1898, at the Salisbury Plain manœuvres I commanded a battalion of mounted infantry which belonged to Sir John French's cavalry brigade.

20139. (*Sir George Taubman-Goldie.*) The point I wished to ask was: Have you made your calculations on the basis of mounted infantry being required to the number required during the South African War?—Yes.

20140. (*Chairman.*) Is there any other point that

Lieut.-Colonel A. J. Godley.

19 Mar. 1903.

Lieut.-
Colonel A. J.
Godley.
19 Mar. 1903.

you wish to mention?—I should like to mention with regard to the strength of the force of 3,500 mounted infantry that it means, of course, that that number of horses has to be provided for—not only provided for their use, but they have to be fed, and provision has to be made for their replacement, which might entail a great extension of remount depôts in the general question of the provision of horses. And it must not be forgotten also that those 3,500 mounted infantry cobs or ponies which are required in an Army Corps would be in addition to all the riding horses required for a cavalry brigade which would probably be working with the Army Corps, or it might possibly be even a cavalry division. It means the provision, feeding, and replacement of casualties for that extra number of mounted men.

20141. And with a special class of horse?—Preferably. I may say with regard to that that in my experience of raising a regiment of Colonial mounted infantry, we got horses for it which were, many of them, quite untrained and very unfit; but the fact of our having them two months before the war was of immense value, and by the time the war commenced those horses were quite fit for work. They were quite trained enough for the men, who began by not being able to ride at all; they were quite fit for those men to ride, and they became quite fit, or comparatively quite fit, in their constitutions, and many of those horses lasted for a very long time into the campaign.

20142. (Chairman.) Two months' preparation is a great matter?—It proved invaluable.

20143. (Lord Stratheona and Mount Royal.) Those were South African horses?—Yes.

20144. (Viscount Esher.) What provision of horses have you now at Aldershot?—We get them only as we require them from the remount depôts. We shall have a fixed establishment at Aldershot. In each of the first three Army Corps there will be a fixed establishment of mounted infantry cobs—an establishment sufficient to train the battalions as they come for training.

20145. But you have not got that establishment yet?—Not yet.

20146. How did you manage last year?—We got cobs from the Remount Department as we required them, according to the number of men to be trained.

20147. And is the number of men to be trained this year in excess of the number trained last year?—Yes. It will be more than double at Aldershot; if the new scheme attains its full proportions.

20148. (Sir Frederick Darley.) What will be the number?—About 1,100 men.

20149. (Viscount Esher.) Not at one time?—Yes.

20150. At one time you will have 1,100 men?—There will be 1,100 men training at one time at Aldershot; 1,100 approximately at one time training on Salisbury Plain; and 600 training at Kilworth, in the South of Ireland.

20151. Do you expect to have your 1,100 men training, in the month of June this year?—Perhaps not quite all, because some of the infantry battalions which will furnish mounted infantry men for training are only just arriving home from South Africa, and their men will be going on furlough, so they may not be able to supply them; but the scheme would have commenced, and we shall hope to have the majority of that 1,100 men.

20152. Then is the system under which you obtain horses satisfactory? Do you find you get what you want?—Absolutely; in the last two years we have had exactly what we wanted.

20153. And the right type of horse?—Yes.

20154. Do you return them at the end of the season to the depôt or do you keep them through the winter at Aldershot?—There have been various systems. Originally the mounted infantry cobs which we used at Aldershot were sold by auction in London. Then that was replaced by a system of keeping only a very small establishment of cobs at Aldershot, sufficient for the training of one company, and then when two companies were trained, as they used to be, under canvas in summer time, cavalry horses were borrowed to mount them on. Latterly we have still had the system of a small permanent establishment of cobs at Aldershot, and when the remount depôt that was at Aldershot was in existence we drew upon it

when we required more, and returned the cobs to the remount depôt after we had done with them.

20155. Then with regard to your staff. Have you a sufficiently large staff under you?—Arrangements are being made for the provision of a proper staff for these training schools.

20156. You had no instructors and you have none now, have you?—No, the principle is that the officers train their men.

20157. What I mean is this, that you take untrained infantry soldiers from infantry battalions, and you take with them untrained infantry officers. Who trains them?—The officers are not all untrained. The principle is that the captain of a company should train his own men, which is a far preferable one to having instructors and drill sergeants.

20158. But then he must know something about it?—Yes.

20159. How do you propose to meet that?—I suggest that no captain of a company should ever command and train a company of mounted infantry until he has first been through a course of instruction in mounted infantry duties himself.

20160. That is all very well when you have the system in thorough working order, but when you are beginning (as you are practically) to organise this force, do you not find it is very difficult?—No. We have all the officers who have had a mounted infantry training in South Africa to fall back upon. We hope to get them to come to command battalions, to command companies, and to train the young officers and men. And there will always be a small permanent staff.

20161. I know, but it was the staff I was specially thinking of. You have an adjutant, for instance. Is he a trained mounted infantry officer?—Yes.

20162. And will one be sufficient for such a large force as you mention, 1,100 men?—Well, there has been a great deal of correspondence about it.

20163. What is your own feeling about it? What is it you want?—My own feeling is that on the whole I have got what I want. There are one or two small details which we differed about—for instance, the authorities do not consider both an adjutant and a quartermaster necessary.

20164. Have you convinced them on that point?—No, I have not.

20165. You are hoping still to do that?—Yes.

20166. What was the opinion you formed of the mounted infantry during the war? Did you come across your own mounted infantry at all?—No, I was with Colonial mounted infantry.

20167. Then you never had an opportunity really of seeing how the mounted infantry that you yourself had trained worked?—I did not actually see them, but I met them after I came from Mafeking with General Baden-Powell's column, and I heard from the mounted infantry officers who had brought them out—from General Alderson and Colonel De Lisle and others—that the Aldershot training system had worked satisfactorily, and they had found that the Aldershot trained men were the only mounted infantry—I will not say quite the only, because there were a few who were trained in South Africa itself—who were really useful at the commencement of the war; they proved that their Aldershot training had been very valuable.

20168. You mentioned Colonel De Lisle. Did he speak well of the mounted infantry as a whole?—Yes, and especially of the Aldershot trained men. He said that the two Aldershot mounted infantry regiments that went out were particularly good—that it took those who began in the country three or four months of active service to equal them. That was his opinion, and it was also General Alderson's opinion. He quoted me an instance—that at Colesberg 150 of his men successfully engaged 500 Boers—150 of these Aldershot trained mounted infantry, those that had come out first from this country—and that afterwards in the following year he had been told that their fire had been extremely good, and had inflicted seventy casualties upon the 500 Boers that were opposed to them, who were astonished to find that the English shot so well.

20169. So you think that the impression of the officers commanding columns who had to use mounted infantry in South Africa was, on the whole, favourable to those who had training at Aldershot?—Yes, very, and any complaints of inefficiency made against mounted

infantry in the early stages of the war were with regard to those who were hurriedly raised with no previous mounted infantry training.

20170. (*Lord Strathcona and Mount Royal.*) When you speak of Colonial mounted infantry, do you mean those raised in South Africa?—Those were the particular ones I was with.

20171. (*Sir Frederick Darley.*) How many battalions do you break up for the 1,100?—Two battalions; the strength is something under 600.

20172. How many officers have you with each battalion?—22.

20173. They are all regimental officers—infantry officers?—Yes.

20174. You have no cavalry officers, no cavalry instructors?—No. The training is an infantry training, and quite different.

20175. (*Lord Strathcona and Mount Royal.*) The complement was higher in South Africa, was it not, than 22 officers?—No, five officers per company; a captain and four subaltern officers to each company, and the commanding officer, the adjutant and the quartermaster. I should have said 23.

20176. In some of the over-sea Colonial corps, they had three or four more, had they not?—Yes, they had.

20177. They had four or five officers?—Yes.

20178. (*Sir Frederick Darley.*) You speak of equipment on the man, on the horse, and on the saddle; taken altogether, what does the horse carry?—I think, with the man, 17st. 6lb.; it should be cut down to from 15st. 7lb. to 16st.

20179. Do you think what you provide here would be about 15st. 7lb.?—Yes, between 15st. and 16st. I do not think it should be more than that.

20180. And are these cobs that you speak of up to carrying that weight for a march, say, of 30 miles a day?—Yes; the class of cob we have at Aldershot now is well up to that.

20181. (*Chairman.*) Is there anything else you would like to add?—There is one point, that is the war establishment. Mounted infantry officers during the war were of opinion that the establishment should be raised, both of a battalion and of a company. Under the system by which one man of four holds the horses of the other three when they dismount to fire, the present establishment only gives 18 rifles to a section; that is a subaltern officer's command, and, with casualties, that may reduce the number of men that he has under his control at the time they are dismounted to perhaps only about a dozen. The officers in South Africa thought that anything under

20 was not effective; that each subaltern officer's command should be at least 20 dismounted rifles; and, in order to ensure giving that, the establishment, as at present laid down, would require to be raised.

20182. (*Sir George Taubman-Goldie.*) By how much?—By 34 privates in each company—34 rank and file.

20183. (*Lord Strathcona and Mount Royal.*) That would be 200 odd for the regiment?—No; 120 odd—four times 34. That would make the establishment of the mounted infantry battalion over 700, instead of under 600.

20184. (*Chairman.*) That you approve of?—Yes, for the reason that, working it down to the lowest command, the subaltern officer should for dismounted work have at least 20 men.

20185. (*Sir George Taubman-Goldie.*) Does that imply an increase of non-commissioned officers?—No.

20186. Lance-corporals and corporals?—No, the real rank and file; they would all be privates in the ranks.

20187. (*Sir Frederick Darley.*) Do you increase the 3,500, or do you break up the 3,500 into five battalions?—No, it would increase the number and keep the battalions the same.

20188. (*Chairman.*) Would it increase the number taken from each regiment from 143?—It would increase the 143 to 175.

20189. (*Sir George Taubman-Goldie.*) 177—you said 34?—I should have said 32.

20190. I thought it must be 32, because that divides by four?—That is one of the objects, to make the numbers properly divisible by four, so as to avoid broken groups of fours.

20191. Then you take 175 from each regiment?—Yes.

20192. (*Chairman.*) Does that increase the number of 30 odd that you take at a time from a regiment? You said 35, I think; it was for peace training; you said you would take a subaltern and 35 men; does that increase the number from 35?—Yes, it will increase it by eight.

20193. (*Viscount Esher.*) Then that would be more than your 143 men?—Yes, it would be 175 instead of 143.

20194. (*Chairman.*) It increases it all round?—Yes.

20195. (*Sir Frederick Darley.*) Nearly two companies—175 men?—Nearly a company and a half of infantry.

20196. (*Chairman.*) Is there anything more to say?—No, thank you.

(After a short adjournment.)

Major-General J. TALBOT COKE, called and examined.

20197. (*Chairman.*) You went out to South Africa in 1899, I think?—Yes, in November, 1899.

20198. And you were in command of the 10th Brigade?—Yes.

20199. Was that in Natal at that time?—It was first of all ordered to go to the Cape, and two battalions started up as far as De Aar, and got up to De Aar. I went from Mauritius myself, and I was stopped at Port Elizabeth, and was sent up country by the direct line to De Aar, where I joined those two battalions. I no sooner got there than I was told that my brigade was to be broken up, and the two battalions were to go round to Natal, and I was to go down to Cape Town and go back by sea to Durban, where I had been nearly three weeks before. I accordingly did that, and my brigade was entirely broken up; the two battalions remained at De Aar, and the remainder went to Natal.

20200. And you went to Natal?—Yes. I never saw the whole of my brigade; it was broken up at the very beginning.

20201. You were in command of the rest of your brigade?—Yes.

20202. And any addition to it?—I eventually got one battalion of the Somerset Light Infantry and a Colonial corps, the Imperial Light Infantry.

20203. That is a corps of South African Colonials?—Yes.

72c.

20204. You commanded the brigade throughout?—Yes, not always the same brigade, they were constantly changed.

20205. You mean the regiments were changed?—Constantly.

20206. But you were in command of the 10th Brigade?—Yes; I got the Dublin Fusiliers and two or three Colonial corps at various times. My regiments were always being changed. I lost the Somerset Light Infantry and the Imperial Light Infantry.

20207. You commanded that brigade throughout the operations for the relief of Ladysmith, and afterwards under Sir Redvers Buller on the Natal side?—Yes.

20208. I understand that you desire to put in a statement on your personal position, which you have sent to us?—Yes, I do.

20209. We will not enter into that in detail, but it will be recorded?—I understand. I also put in a memorandum upon Spion Kop, which I think has, perhaps, got some details of public interest. It is not personal at all.

20210. That is the memorandum I was referring to?—The end of it, perhaps, is personal, but I think the great portion of it is of public interest and unpublished.

Lieut.-Colonel A. J. Godley.

19 Mar. 1903.

Major-General J. Talbot Coke.

MEMORANDUM UPON SPION KOP.

Major-General J. Talbot Coke.

19 Mar. 1903.

Many accounts have been written of the action of Spion Kop, yet there is much that has not so far come to light, and it is with reference only to such that I will touch in this statement.

Sir C. Warren's nine days' operations after he crossed the Tugela on January 17th, 1900, have in a measure been merged under the name "Spion Kop," and it is common now to hear that name given to the attempt to turn the Boers' right by Acton Homes, and to somewhat lose sight of the fact that the fighting on Spion Kop Mountain took place on January 24th.

The 10th Brigade under my command was employed in a reconnaissance at Shiet Drift, on the right flank of Sir R. Buller's position at Spearman's Hill, when Sir C. Warren crossed the Tugela at Trichard's Drift. It was not until January 22nd that my brigade was sent to reinforce him.

January 22nd.—We made a night march, leaving Spearman's Hill soon after 2 a.m., having, besides the 10th Brigade, two ammunition columns and some artillery. Halting my brigade at Ventner's Spruit, I reported myself to Sir C. Warren before noon. He decided to divide his force into two halves, the right and left attack, and he appointed me to the command of the former, and to be responsible for the safety of the right flank.

Colonel A. W. Morris was the only staff officer I received to help me with this large command, but I retained my two staff officers of the 10th Brigade, handing over the command of that brigade to Colonel Hill, and directing him to appoint his own staff. Here was another of our many cases of "organisation disorganised;" officers being appointed to command large units without any proper staff; everyone doing someone else's work; whilst Sir R. Buller, with a complete staff, was exercising no real command only a few miles in rear at Spearman's Hill.

During the afternoon of January 22nd I went to the front with Sir C. Warren to reconnoitre the enemy's position in front of Three Tree Hill, but we were soon driven back by the Boers' fire. A conference was then held, at which Sir C. Clery demurred to the contemplated attack of the enemy's right; in this he was supported by General Hildyard. The attack on that flank was therefore given up, and instead I was ordered to, that night, occupy Spion Kop with two battalions of the 10th Brigade.

It will be noticed that this brigade, after a night march, was halted at Ventner's Spruit, three miles west of the front, and were entirely ignorant of the Spion Kop or how to get up it, whilst four other brigades had been for six days fighting, more or less, under that mountain.

It was after 5 p.m. before any written orders were issued on the subject, and I at once saw that it would be quite impossible to make any reconnaissance of the approaches to Spion Kop, to get the two battalions up to the place of assembly, and to issue the necessary orders, ammunition, and rations before darkness set in. I had already asked for a guide, and was told there was no one who knew the way up. On representing these facts to Sir C. Warren, and after we had ridden to the foot of the mountain and hastily looked at the approaches, he said that I might countermand the orders if I thought they could not be safely carried out. About this I had no doubt, and Lieut.-Colonel Thorneycroft, who was ordered to accompany the attacking force with details of his mounted infantry, and who had some knowledge of the difficulties of the ground, entirely concurred in my views.

It was by this time 7 o'clock, and getting dark. I well knew the position of my own bivouac, not two miles in rear, but it was so dark that I failed to reach it, and had to sleep out. I merely mention this fact to prove the great difficulties of night operations in rough country in South Africa. Even the Boers, we now know, frequently lost their way. Had the two battalions, under the circumstances I have described, attempted to seize Spion Kop, the result must have ended in a terrible disaster; where they would have got to I do not know, but they were just as likely to have reached the strongest part of the Boer position as the summit of Spion Kop. I consider that no operation of the whole war could have been undertaken with less favourable conditions. Personally, I was concerned only as regards the success of our arms, for I had, as previously stated, handed over the com-

mand of the 10th Brigade to Colonel Hill, and, having a very large command (an infantry division, artillery, cavalry, Royal Engineers, and various details), I never contemplated leading the attack of such a small portion of my force; such would have been a gross disregard of my higher duties, and entirely at variance with the custom of war and the orders of our Army.

January 23rd.—On January 23rd I met Sir C. Warren at 5 a.m., and rode many miles with him and other officers, observing Spion Kop from various points. The result of this reconnaissance was almost an unanimous opinion that the best way to ascend the mountain was by the south-western slopes from a rendezvous in the valley by the Royal Engineer bivouac.

During the day I received orders from Sir C. Warren for the attack on Spion Kop; Major-General Woodgate to command. I issued the following orders:—

Attack Orders—Issued by Major-General Coke,
Commanding Right Attack.
January 23rd, 1900.

1. The General Officer Commanding has decided to seize Spion Kop.

2. The operation will be conducted by Major-General Woodgate, who will detail two battalions of his own brigade, to which will be attached about 100 men of Thorneycroft's Mounted Infantry and half company of Royal Engineers.

3. Rendezvous just east of the encampment Royal Engineers, at 7 p.m. Men must be kept concealed from the front.

4. One hundred and fifty rounds of ammunition will be carried by the men. The General Officer Commanding 11th Brigade will attach three mules to each battalion, and the officer commanding 10th Brigade three mules, this afternoon. Ammunition for these mules will be furnished by the battalions concerned. One day's complete ration to be carried by the men. All horses to be left at the Royal Engineer bivouac. The mules will follow in rear of the column. Men will carry entrenching tools in stretchers.

5. The Officer commanding the Royal Dragoons will arrange to picquet all native kraals on the line of advance, and also Wright's Farm. All inhabitants should be confined to the buildings.

6. Men will, of course, carry filled water bottles, and should be cautioned that a refill may be difficult. Battalions will endeavour to make some arrangement, by fastening biscuit boxes on to mules, or in some other manner, to carry extra water.

7. The General Officer Commanding 11th Brigade will arrange that the volunteer ambulance and the bearer company of the brigade send detachments. No ambulances to be nearer than the Royal Engineer bivouac till daylight.

J. TALBOT COKE, Major-General.

These orders were well thought out. Of course, they could not have been made had the attack been attempted on the night of the 22nd. After the issue of them, Major-General Woodgate made a request that the rendezvous might be changed to Wright's Farm, and later (5.30 p.m.) asked that it might be, as first ordered, at Royal Engineer bivouac; so that his indecision caused a good deal of unnecessary confusion in orders. He appeared to be in bad health at the time. His column made a bad start when it did march off, and lost its way before it had gone a mile. I sent Captain Phillips to lead them back and to give them a good start in the right direction. I moved for the night into the front trenches of the Connaught Rangers, our nearest position to Spion Kop, and from which I should be able to see what was going on.

January 24th.—My report on the attack has been printed (White Book, Cd. 968, 1902, South Africa, the Spion Kop despatches, pages 29, 30, 31), but my signal messages during the day have been omitted, and perhaps the Royal Commission may think a few further details of interest:—

Sir C. Warren came up to me as soon as he received the heliogram, "Reinforce at once, or all lost; General dead," ordered me to reinforce, and to proceed to the mountain. He told me that the position was to be held at all cost, his final words being, "Mind, no surrender." I assured him that the position would be held.

My first message to Sir C. Warren was despatched at 12.50 p.m. :—

"I am now on the plateau of Spion Kop slopes. The top of the hill is reported crowded with men, and as these are exposed to shell fire and suffering, but holding out well, I have stopped further reinforcements beyond this point, but the troops engaged know that help is close at hand. Ammunition is being pushed up."

At 3 p.m. I made a report :—

"I have ordered the Scottish Rifles and the King's Royal Rifles up to reinforce. The Middlesex Regiment, Dorset Regiment, and Imperial Light Infantry have also gone up. Bethune's Mounted Infantry (120 strong) also reinforced. We appear to be holding our own at present."

At 3.50 p.m., after I had reached the summit, I reported :—

"We are suffering much from shrapnel fire from our left front, bearing magnetic north apparently from Three Tree Hill. The hill is being cleared of Boers. The necessary reinforcements have been ordered up. Scottish Rifles have just reached top of hill. Casualties heavy. More doctors, food, and especially water wanted."

On examining the position from our left flank I soon saw that although our men were badly posted, the fire was so intense that it was quite impossible to occupy better posts till darkness set in. I accordingly approved of Colonel Hill's proposal to hold on until dark and then intrench.

By 3.50 p.m. all reinforcements had reached their positions. Large numbers of men were held in reserve out of fire; many more employed in helping wounded comrades down the hill, others in carrying empty water bottles to be filled, so that generally there were not more men in the trenches than were required to keep back the Boers; but in some cases the trenches, which were badly constructed, were far too crowded. The chief losses from shrapnel fire were, I believe, caused by the 15-pounder British guns which were left for the Boers after Colenso. Certainly (after they had expended our ammunition) no subsequent Boer artillery fire proved to be anything like so effective.

In the selection of position from which to hold the summit of Spion Kop there was the choice of "the forward position," which would have swept most of the ground in front by fire, but still have been enfiladed by the Boers on the Twin Peaks, and of "the backward position," which, I believe, was advocated by Sir C. Warren, and from which the mountain could certainly have been held with the minimum of loss, but it had the disadvantage of reserves being close up to the firing line, and any second position impossible. These were really the only two possible positions, but that taken by our troops in the darkness and mist was an intermediate position, anything worse than which was impossible.

Passing on to the extreme right flank I found Colonel Hill, commanding the 10th Brigade, and who, in my mind (without any doubt), was senior officer in command of the summit. No word had reached me of Lieut.-Colonel Thorneycroft's appointment to command, and I regarded him simply as a junior brevet lieutenant-colonel in command of a small unit. There were many officers senior to him on the mountain.

I heard Colonel Hill's opinion on the situation, and more fully his proposals to hold on, entrench, and otherwise strengthen the position so far as possible during the night. I then, in the presence of Colonel Hill, wrote the following report to Sir C. Warren, despatching it by Colonel Morris about 6 p.m., and handing a duplicate to my signalling officer to be signalled :—

"Top of Spion Kop,
"5.50 p.m., 24-1-1900.

"The situation is as follows :—The original troops are still in position, have suffered severely, and many dead and wounded are still in the trenches. The shell fire is and has been very severe. If I hold on to the position all night is there any guarantee that our artillery can silence the enemy's guns, otherwise to-day's experience will be repeated, and the men will not stand another complete day's shelling. I have in hand Bethune's Mounted Infantry and the Dorset Regiment intact to cover a withdrawal. If I remain I will endeavour

to utilise these units to carry food and water up to the firing line. The situation is extremely critical. If I charge and take the kopje in front the advance is several hundred yards in the face of the entrenched enemy in strength, and my position as regards the quick-firing guns is much worse. Please give orders, and should you wish me to withdraw cover retirement from Connaught's Hill.

"J. TALBOT COKE, Major-General."

Colonel Morris, who had been with me all day, thoroughly knew the whole state of affairs, and I directed him to report fully to Sir C. Warren as well as to hand him my message.

Leaving Colonel Hill, I moved by the dressing station to the upper plateau, where I posted the Dorset Regiment and Bethune's Mounted Infantry to check any possible downward rush and to cover the withdrawal if such was ordered. Passing on to the signal station, I there received, at 9 p.m., a message from Sir C. Warren to report myself to him at once. I handed the following message to the signallers in reply :—

"Night so dark and country so rough that the whole night would be taken up in journey. Is it not possible to give orders without my presence?"

But the oil in the signaller's lamp failed, the message could not be sent, and there remained nothing but for me to obey the order. I may here mention that although I sent several messages to Sir C. Warren during the day, I got none from him except the above-mentioned.

After great difficulty in finding Sir C. Warren's bivouac, which he had changed during the day, I reported myself to him about 2 a.m. Lieut.-Colonel Thorneycroft came in within a few minutes of me and reported that he had evacuated the position.

I maintain that I did all that was possible to improve the state of affairs after I reached Spion Kop. Over the original state of affairs I had had no control, and I found a scene of considerable confusion when I reached the mountain. After that I regulated the reinforcements according to the requirements, got a plentiful supply of ammunition up to summit, added to the water supply, established a signalling station, and, without taking the command of the summit out of Colonel Hill's hands, I generally improved matters. Sir C. Warren appeared to be quite satisfied with what I had done and requested that there might be an inquiry into the unauthorised evacuation. But Sir R. Buller's conduct was certainly most extraordinary. He neither saw me nor said one word to me regarding the action, though I met him daily.

Lord Roberts, in his report of February 13th, 1900, on the Spion Kop operations, whilst freely blaming many of the officers concerned, passed no censure on the part I took. Sir R. Buller subsequently three times favourably mentioned me in despatches, and personally thanked me in the field for my action in holding on to the position of Van Wyk (June 6th, 1900), and the capture by my brigade of the strong position of Alleman's Nek (June 11th, 1900), by which the Boers were driven out of Natal. Yet after his return to England he most unaccountably made an adverse report on me, especially as regards Spion Kop. This report he in no way communicated to me (contrary to the Provisions of His Majesty's Regulations).

I respectfully urge that if fault is to be found with an officer's conduct in the field some disapproval should at the time be shown, but that the practice of making adverse reports after the lapse of many months, and after favourably mentioning services in despatches, is contrary to the best traditions of our Army, and, if allowed to form a precedent, will strike deeply at the honour and good understanding existing amongst officers, the maintenance of which is essential to the success of our arms in future wars.

The way in which I have been treated is entirely at variance with the public statement made by the Secretary of State for War to the House of Commons, to the effect that no officer could suffer without a full inquiry into his case, for I have had no such inquiry, in spite of my many appeals for justice, and I have so far been denied any opportunity of replying to and disproving what has been alleged against me by Sir R. Buller.

20211. I think you are willing to give us some evidence with regard to the training of the Army from your experience not only in the war, but also before the war?—Yes.

20212. Before the war you were Chief Staff Officer

Major-General J. Talbot Coke.
19 Mar. 1903.

Major-
General J.
Talbot Coke.

19 Mar. 1903.

at the Curragh Camp of Instruction and at Aldershot?

—Yes.

20213. And you were also present at the German and French manœuvres of 1897?—Yes.

20214. We shall be very glad to hear what you have to say on that subject?—I thought it might help matters if I wrote out a short memorandum. I thought it might perhaps be more deliberate, and it is founded on my notes which I took at the time, and which I have here.

20215. If you will give us the memorandum I think it will be helpful to us?—I maintain that there was not much wrong with our peace training, but that many of our officers failed in modifying conditions which were taught them for meeting regular European troops, and which conditions required modification to meet irregular troops in a country like South Africa.

The peace training of our Army has of late years allowed ample latitude, so that our men were taught styles of warfare suitable for the many different countries in which they might have to fight. For instance, in the company training of our infantry the men, if properly instructed, were taught to manœuvre over rough ground, through woods, etc., with the broadest possible front and in the loosest possible formation. The battalion drill which followed the company also allowed most extensive and loose formations. Next came the brigade, and even in this both loose formations were practised as well as the closest, the latter being required for savage warfare. But when we passed on to the instruction of large forces and big manœuvres naturally we had to restrict the area of operations, and it became necessary to preach against the error of dissemination of troops by undue extension of front. It became necessary to limit turning operations so that the distance covered in these movements did not too severely tax the strength of the troops, and so that the flank march could be completed within a reasonable time allowed for the day's operations.

It must be remembered that there is great danger in too closely applying the lessons of the Boer war, for the Boers never made a counter attack, and were we to disregard the necessary Reserves required to meet such (as we often did in South Africa), we should be inviting a great disaster were we to meet a foe ready to take advantage of false formations.

To return to our peace training, the first great principle which was instilled was "The importance of effective reconnaissance before committing troops to the attack"; had that lesson been remembered by all our Commanders, how many disasters would have been averted in South Africa?

Our troops were carefully trained to take cover, yet a Britisher is so regardless of fire, that the greatest difficulty was often found in preventing men from exposing themselves. I fear that so long as this characteristic exists, no amount of peace training will produce a better result in war.

All arms were instructed in night operations, as well as day, and large forces of all arms were constantly practised in combined night operations—a most useful part of our instruction.

When we come to compare our peace training of large forces with the system of that adopted on the Continent, we have first to remember that we all have these large numbers of horse, guns, and infantry to put on the ground. It is folly to so extend the front to that extent, that no umpire staff can follow the manœuvres; all nations, therefore, have in large manœuvres to work in closer formations than would be possible under modern conditions of war. They have to instruct their masses as best they can. If the large masses are not brought together, the General Officers get no practice in handling such; but it is a mistake to think that the actual troops get the most useful lessons when assembled in large forces, for on those occasions one always sees many of the most impossible situations. The men are really best taught in smaller operations. Take, for instance, the employment of artillery; the effective shrapnel fire of field guns has lately been greatly increased, and the heavy batteries, which are being introduced, have a range only limited by our power of vision; would it be any real instruction at peace manœuvres to keep guns at this distance? Would anybody know when and at what target the guns were firing? And with smokeless powder, would the guns ever be observed at

all? We know that in South Africa we were often days in finding the positions of Boer guns, which only showed their existence by dropping shell amongst us. So, for any useful instruction in peace manœuvres, guns have to be kept within a range which they would not keep at war. In a similar manner, opposing infantry has to be kept for purposes of instruction at closer distances between forces than would be possible in war. This is not only the case with our Army, but in all Continental armies also. An intelligent officer realises this, and immediately modifies formations, so as to be best able to meet his foe, when he becomes engaged in war.

As regards cavalry training, in my opinion, this has not been so well carried out as that of other arms; the result has been that they did not have great successes in South Africa. One sees similar faults in Continental cavalry training.

Generally speaking, the great fault of our manœuvres is hurry. Our officers allow firing lines to rush forward without having established a superiority of fire, and an attack on a strong position, which would take hours to carry out in actual war, is, owing to the impetuosity of our officers, often over in a few minutes. We require more patience in carrying manœuvres through, and our General Officers are too ready to sound the "cease fire." The Germans are much more deliberate than we are, and the French operations were very prolonged—one good day's work of theirs would make three of ours.

In the German Army the proper proportion of entrenching tools is always carried by the troops, and field entrenchments are made by the defence. In our Army we have been much handicapped by the orders forbidding to break ground, and no practical spade-work is carried out during manœuvres. This has had a very bad effect on our Army, and there were many instances in South Africa of entrenchments not having been made, when such should have been constructed. The sections, showing the various dimensions for shelter trenches for infantry, as given in our text books, were also terribly faulty. Much of our loss at Spion Kop might have been avoided had our men then possessed any knowledge of the principles on which entrenchments should be made, which they afterwards practically learnt from the Boers. The "Infantry Drill," 1896, laid down that the trench should be 5ft. wide, and 1ft. 6in. deep. We found the right construction should not be more than 2ft. wide and 2ft. 6in. deep, with soil thrown up in front and rear.

The small entrenching tool carried by the men was absolutely useless. Full-sized picks, shovels, and crowbars should be carried on mules and in carts for about half of the force—not more than this proportion would be likely to be employed digging at one time.

20216. Do the foreign armies carry entrenching tools in the way you have described?—They carry better tools now than we do, but still I think there was some fault to be found with them, and they are reforming that I believe. There is no doubt that they should be carried of the full size; there is no such thing as a half-size in a military tool, and what we want really are navvies' tools, picks and shovels.

20217. Do the foreign armies carry navvies' tools?—Not the infantry, but the artillery do, and they carry them on their limbers.

20218. Do the infantry carry them themselves?—No, they only carry those small entrenching tools, the same as we did.

20219. And the experience of the war has clearly shown that that is insufficient?—Entirely.

20220. (Sir George Taubman-Goldie.) Does that apply to both the French and German armies?—Yes, they both had small tools.

20221. Corresponding to our Wallace spade?—Yes; but I think they have got rid of them by this time; I am talking of 1897.

20222. (Sir John Jackson.) What would you do with the picks?—They must be carried on mules or carts.

20223. You would carry the ordinary shovel and pick?—Yes, and a certain number of crowbars. I worked out the exact proportion of the number of mules that would be required, and the number of carts for a brigade reserve. I made a report upon that while in South Africa, and, as a matter of fact, we really did rectify that during the war, and we had our full-sized tools.

20224. (Sir George Taubman-Goldie.) Did it make a serious increase to the transport?—Not so very much. We had an ox waggon for each brigade, and a certain number of mules. They were handed over to the am-

munition officer, and they were brought up always into the line when wanted, and had the most useful effect, our entrenching work being very much better after that.

20225. You have spoken on the subject of manœuvres. Of course, you have followed the new system of staff rides?—Yes.

20226. As far as training officers is concerned, do you think that fulfils all the requirements?—I think it is a very useful adjunct, but I think the practical training of troops on the ground is always necessary.

20227. I rather gathered that you said that the manœuvres on a smaller scale were more useful?—More useful for the men.

20228. You would not say that large manœuvring countries are needed for troops?—For instruction of our officers, certainly they are, but I do not think for the men.

20229. Cannot that instruction be given by staff rides?—I think not.

20230. We have had some evidence to that effect?—I think it is impossible to arrive at that result by staff rides; there is a great deal of supposition, and if you are told an Army Corps is in a certain place, and a division in a certain place, it is very hard to realise if you do not see the troops.

20231. But everything is carried out on a staff ride as it is in a campaign?—So far as the orders are concerned, but the orders to the units are entirely imaginary.

20232. But you receive your instructions from the director?—Yes.

20233. And then you issue your orders exactly as in a campaign?—Yes, it is a very good practice for issuing orders, but I do not think it is any practice in commanding troops.

20234. Could that be got in small manœuvres?—No, I think not. I think it necessary to have these large manœuvres and to put these large numbers of troops on the ground, but what I do maintain is that our system of training before the war was not so faulty as our critics would make us believe, because it is simply necessary to crowd so many men to the acre, and you must have them on the ground if you are to teach your officers. The Germans have generally on the ground about eight men to a yard, one man to a yard front and eight deep—of course, extending many yards back, but about eight men to a yard was about the German calculation. I do not think our forces have ever been assembled in that strength.

20235. That would not be the system in actual warfare?—Not at all.

20236. Where do they get their real training for war, then?—I am afraid when the fire commences. That is their training now.

20237. Before the Franco-German War they must have had similar training?—Entirely.

20238. Yet when the war began the Germans were ready?—The officers were good, and they accepted the changed conditions. They very soon saw when they came under fire that it was impossible even in those days with the rifle the French had—the old chassepot—to advance in a solid formation, and the officers very wisely opened out.

20239. Does it not perhaps come to this, that as long as the men can march and shoot the chief point is that the officers should know their work?—Yes; but I think the officers to get really good training must have large manœuvres.

20240. Although under different conditions from war?—I am afraid that is necessary.

20241. What I want to get at is, that I do not quite see how training officers to work with men eight deep could train them to a condition of warfare where the men would be extended in lines at considerable distances from each other?—I do not mean that the men are eight deep in a solid formation, but that is covering a depth of perhaps a mile and a half.

20242. Eight men to a yard?—Yes, about a mile and a half in depth.

20243. Which is almost the inverse really of war, where each man has eight yards laterally?—Yes, but with these large forces they have on the Continent they must get their men on to the ground, and what are they to do with them?

20244. Then where is the training for the officer?—I am afraid the training is faulty for that reason, but it teaches the commanders their work. It teaches staff work, and when it comes to the time, if the officers are properly instructed, they can easily apply the modern conditions and extend their men.

20245. Do you think that a very extended system of staff rides and a great deal of training of the troops, the men themselves, in companies, battalions, and brigades—the smaller units—would carry out practically all that is needed?—I think, as far as we are concerned, it might help; but, of course, our forces are not quite so big as the French and German armies, and we have not got as many men to the acre.

20246. I speak of our own Army?—Yes, I certainly advocate, as far as possible, the training of units in small forces, and not in big forces.

20247. And, if so, the question of huge manœuvring grounds would not come in?—Except that a change of ground is a great matter?

20248. Do you know Ireland at all?—Very well.

20249. The West of Ireland?—Yes.

20250. Do you think large manœuvring grounds could be got there for occasional periods?—I think so. The whole of Ireland produces the most beautiful training grounds. I have manœuvred over a great part of county Kildare, parts of Queen's County, and county Kilkenny, and a great many other counties.

20251. (*Sir Frederick Darley.*) Is the Curragh a good training ground?—We were manœuvring from the Curragh, but the Curragh itself is too small.

20252. (*Chairman.*) There was one other point, I think, on which you said you would give us some evidence, with regard to the Colonial troops?—Yes, I have prepared a statement on that subject. My experience is chiefly based on the Imperial Light Infantry, a battalion raised in Natal on the outbreak of the war, and which joined my brigade at the end of December, 1899, at Estcourt, when they were recruited up to full strength. This was an infantry corps, composed in a large measure of refugees from Johannesburg. In South Africa the best men go to mounted corps, for the Colonial has a horror of marching. The men were in physique very unequal, as were they also in age, but they were of a better class than the Colonials who formed the bearer companies. There were but two Regular officers attached to the battalion, the commandant and the adjutant (a young subaltern). The Colonial officers were about the weakest part of the regiment. With few exceptions the officers knew nothing of their work, and seemed to take little interest in learning it. Many of them were not to be trusted on detached duties, and many of them (if they got an opportunity) would get drunk. The whole of our force in South Africa was short of officers, but certainly it would have been better to have sent more officers out from home when these Colonial corps were raised.

It was a severe test on a battalion of this sort to be brought into action at Spion Kop (24th January) for its baptism of fire, just at a critical moment, when our men could hardly hold their own, and when they were being exposed to the most terrible shrapnel fire of the war. The companies had also in a large measure to be broken up, as reinforcements were only sent in small numbers to any particular spot. Those who went into the firing line behaved with the greatest gallantry, but a large proportion of their comrades never fired off their rifles on that day.

20253. (*Sir John Jackson.*) From what part of the Colonies did those men come?—Chiefly from Johannesburg. There were many refugees, and there were a few men from down country.

20254. (*Sir George Taubman-Goldie.*) There were no oversea Colonials among them at all?—No, none at all.

20255. (*Chairman.*) Will you please proceed?—A comparison of the expenditure of ammunition during that day and the casualties in the 2nd Middlesex Regiment and in the Imperial Light Infantry is, I think, a practical proof of what I state:—

	Casualties.	Ammunition expended.
2nd Battalion Middlesex	103	69,012
Imperial Light Infantry	125	14,300

The Imperial Light Infantry had twenty-two more casualties and yet fired only about a fifth of the num-

Major
General J.
Talbot Coke.
19 Mar. 1903.

Major-General J. Talbot Coke.
19 Mar. 1902.

ber of shots that the Regular battalion did. That is the point, I think, that a great number of men did not go to the front and did not do their duty, but those who did go to the front behaved with great gallantry and lost their lives.

20256. Might it not be that they chose their opportunities of shooting more than the British troops?—I do not think to that extent; they could not have had better cover, and they lost more men than the British troops did.

20257. But in the actual shooting, does not the British soldier perhaps not choose his mark so deliberately as the Colonial?—Yes, I think that is the case if the Colonial is well trained—in fact, I am sure it is; but these men were not well trained; they were not of the shooting Colonial stamp at all.

20258. That would not have applied to them?—No, it would not have applied to them—to a few of them certainly, but not to the majority.

20259. (Sir John Jackson.) What class were they from mainly?—They were chiefly Johannesburg men from the gold mines. They were a good class of men as far as education and that sort of thing went.

20260. And townsmen more or less?—Townsmen, most of them.

20261. (Sir Frederick Darley.) Who commanded them?—There were two commanding officers during the period. I forget what regiments they belonged to, but two of our regular majors commanded them.

20262. (Chairman.) What class of men were they—clerks and that sort of thing?—Clerks largely. The men could not be said to be wanting in intelligence, but they were lazy, did not, as a rule, care to learn soldier's work, and were always longing to be back in Johannesburg. Such were not to be trusted in the outpost line.

The South African Light Horse (Byng's) were with me for some time later in the war. These I found to be a very different class. They were intelligent, dashing, and could be thoroughly relied upon. They had been more carefully selected than the infantry (many of them came from overseas, from our outside Colonies, New Zealand, Australia, and all parts of

the Colonies, and they were carefully recruited), and were a very useful body of men. They had a large proportion of Regular officers, and this also helped them. I preferred having the South African Light Horse to work with me to any cavalry regiment I had in South Africa. I got better results out of the South African Light Horse.

20263. The South African Light Horse were mounted infantry?—Yes.

20264. They would not perform like cavalry?—No, they were entirely mounted infantry, and were not trained as cavalry.

20265. What happened to the Imperial Light Infantry after that? Did they go through the war?—Yes, they were not disbanded until the end of the war.

20266. And under what conditions were they enlisted—the same as the mounted corps?—Yes, they were enlisted for the war generally.

20267. Were they paid the 5s. a day?—Yes.

20268. But they would not compare with an ordinary British regiment?—Certainly not; they were not the class of men to make soldiers.

20269. You did not have anything to do with the oversea Colonials?—No, I had nothing to do with them.

20270. Is there anything else you would like to add?—I brought all my correspondence with the War Office. It is rather a personal matter, but I should rather like to remark that I have addressed this file of papers to the War Office and I have entirely failed in getting the very slightest injury. I saw the Commander-in-Chief, Lord Roberts, and he was very polite and told me he could not in any way listen to anything; that is all I got out of him, and so far I have not had the slightest inquiry.

20271. That is raised in the paper you have handed in?—Yes, I have said so, but I did not quote the letters.

20272. But you have raised the question about the inquiry you demanded in this paper?—Yes.

20273. And, as I have said, what we propose to do is to record that?—

Major The Marquis of TULLIBARDINE, M.V.O., D.S.O., Royal Horse Guards, called and examined.

20274. (Chairman.) You served in South Africa?—Yes, I went out in 1899.

20275. In what capacity?—I went attached to the Royal Dragoons as a subaltern.

20276. The evidence which you have been good enough to give us is with regard to the raising of the Scottish Horse?—Yes, it deals practically entirely with Irregular corps.

20277. That was in December, 1900?—Yes.

20278. In this paper which you have handed to us you have detailed the steps that were taken to raise the Scottish Horse?—Yes, I have put them very fully.

20279. If you have no objection, we will record that as your evidence?—Very well.

20280. There is appended a report by the Duke of Atholl with regard to the steps taken in this country?—Yes.

20281. And that also you put in?—Yes.

I.—STEPS TAKEN TO RAISE.

During the last week in November, 1900, I heard Lord Kitchener had sanctioned the raising of a force, to be known as "Scottish Horse," as a kind of town guard in Johannesburg. I wrote and told him that I was sure this scheme could be enlarged if he wished, but that he must appoint a good Scots officer to take command, and not certain officers whom I had heard mentioned as being likely to be appointed, if the movement was to be a success from a national point of view. I stated that, knowing nearly every Scotsman in Natal, I would be glad to recruit among them and send them on to whoever was appointed to command. As at that time I had a good staff appointment in Natal, I had no idea of joining myself. However, on December 15th, General Hildyard, commanding in Natal, received

orders to send me up to Johannesburg to command and raise the regiment, which was to have a strength of four squadrons, or 500 men. I secured the services of Captain Blair, King's Own Scottish Borderers, and Sir William Dick-Cunyngham, Black Watch, to act as second in command and adjutant respectively. Captain Blair was immediately sent to Cape Town and Sir William Dick-Cunyngham to Durban to organise recruiting. I proceeded to Johannesburg, and there was received by the Johannesburg Caledonian Society, at least, such members as were in the place, and they gave me their whole support. Johannesburg being at that time very sparsely populated, I was only able to get about 30 men, but they were nearly all Scotsmen, and very good men who had seen service during the war. Meanwhile I had written to the Caledonian Societies at Durban, Port Elizabeth, and Cape Town, all of which did their best to assist me, especially that at Durban. The result of this was that I was able to take the field with three full squadrons by February 4th, and had a fourth one ready by the middle of February. Most of the men had seen service. As I wished to command a Scots corps I had asked Lord Kitchener to wait six weeks to allow me to get good men from home, but he said he wished the corps raised at once and that I could enlist them for a short time only in the meantime. At the time there were upwards of fifteen regiments, I think, recruiting in Natal and along the coast, and the competition was very keen between regiments. The result, however, was deterioration of class. Of those I enlisted at that time I should say about half were Scotsmen or of Scots descent, the other half being from anywhere, but my rule was that no foreigner should be admitted, under any pretext, at that time. (Later on I took three Swedes, but they were all three settled in South Africa, or intending to settle, and were taken for special reasons.) A great

Major The Marquis of Tullibardine
M.V.O., D.S.O.

many foreigners of doubtful class were being enlisted at this time in some of the other corps, though not returned as such. I also refused to take any Dutch or half-castes (later on a few were taken as special scouts). Captain Blair raised about a squadron and a-half while at Cape Town in a very short period. About twenty of these, however, I sent back, as they were not up to the standard of character, etc., required. I also refused about 80 of those who came up for final approval in Natal (having been passed by the recruiting doctor and the recruiting authorities), as not being up to moral standard required. Speaking generally, some of the very best men I had in South Africa among South African enlisted men were among the lot recruited at this time, and they stayed with me, re-enlisting as their period of six months expired, to the end of the war. The general run of these men, however, was moderate compared with the men I got later from Australia and home, and from South Africa itself when the regiment's name got better known. The men, however, did extraordinarily well, and better than I had expected they would. I found that I had not been strict enough with medical examination, especially with regard to teeth, and after this was always more particular in this respect, as, before accepting a recruit, he had to pass my test, as well as that of the doctor at the coast. This finishes South African recruits, all of whom at this time were raised for six months, though later I signed them on for "one year or less." I must here point out that the men obtainable in South Africa were much inferior to those originally raised for the Imperial Light Horse, South African Light Horse, etc., though these at this time were also descending in class, and were accepting recruits even inferior to those accepted by me. In the above class, i.e., South African recruits, as they joined under the same conditions, should be included about 200 men I got from the various Scots Volunteer Service Companies. Whenever I heard that any of these companies were time-expired, having finished their year in South Africa, I used to go down and interview them, and get any of those who wished to stay on to see the end of the war, or to get experience of mounted work, or to settle in the country. Owing to their having learned habits of obedience and discipline, and having a good knowledge of drill and being excellent shots, they were, taken as a body, the 200 best men I ever had in the regiment. The first hundred of them, whom I got from the first Volunteer Service Companies that went out to the war, were the best body of men in every way that I saw in South Africa. This particular squadron had a reputation which extended far beyond the column with which it was trekking.

Yeomanry from Home.—In the meantime I had also got permission to get men from home under Yeomanry conditions, and had wired to the Caledonian Society in London. This society was instrumental in raising me three squadrons, which left Great Britain about February and March, 1901. Before these arrived, Lord Kitchener told me to go on raising men for a second regiment, so I wrote to my father, the Duke of Atholl, who raised these extra men as required, by squadrons, and, being freed from the control of the Yeomanry authorities at Aldershot, the men came out better equipped, and in regular drafts, as required. From first to last he sent me out 1,250 men (including the three squadrons raised by the London Highland Society). These were the best lot of men, on an average, I ever had in the regiment. My summary (*vide page 455 post*) gives their numbers, date of leaving, and whence principally recruited. My complaints against the first two squadrons were that they would not wait until the Scottish Horse were arranged in squadrons, and send them out as proper units, but sent them out by ones and twos, as they were recruited with any draft of Yeomanry which happened to be coming out. For example, having had their names privately sent to me, I boarded the ships containing drafts from home. On one ship, containing about two or three hundred of the Duke of Cambridge's Yeomanry, I picked out 11 of my men, and on another ship containing Yeomanry, four. These men were included on the strength of the Yeomanry squadrons to which they were attached, and were shown as part of these units, and not supernumerary to them. I never had one roll or statement of any kind, or copy of accounts from the Yeomanry authorities at any time with regard to these first three squadrons, and was unable to extricate it out of them. This caused a great deal of difficulty with regard to their accounts, etc. The only

condition I made when I offered to raise the above men from home was that they should be directly under me in South Africa, and not subject to the Imperial Yeomanry authorities, as it was impossible for me to be under the Assistant Adjutant General, Imperial Yeomanry, and the Assistant Adjutant General Colonial forces at the same time.

Major The
Marquis of
Tullibardine,
M.V.O., D.S.O.
19 Mar. 1903.

Australians.—When I first got orders to raise the regiment, I had an idea that I should be able to get Scotsmen from Australia and Canada, who had emigrated from our part of the world. Lord Kitchener gave me leave to wire to Australia, so in January I wired to the Caledonian Society in Melbourne, who immediately took it up, and about 300 men joined me by the 8th March. These men were a splendid draft, very fine riders, and all Victorians. They were all sent to the second regiment and kept together, and did very excellent service. I kept up the strength of these Australians by subsequent drafts, who came out from Sydney. The first draft was got under the direct knowledge of the Australian Government, but were brought over and raised at the expense of the Imperial Government, and were not part of the recognised Australian contingents. Other Irregular corps, finding I had got this draft, immediately tried to do likewise, and spoiled the market, trying to obtain men by all sorts of means in Australia, with the result that the Australian Government put their foot down, and refused to allow any men to be recruited officially. For my second draft I got over this difficulty by getting the men under the heading of men who had already served in Australian regiments, and who wished to come out to South Africa again. The Australian Government allowed a limited number of these men to come out in August, 1901, and, by arrangement with Lord Kitchener these men who signed on in Australia for the Scottish Horse were allowed to come to me. This got the Australian Governments out of the difficulty of having to break through their rule. Had the war continued, I had made arrangements for about 300 more to come out on somewhat similar lines. My first draft of Australians was enlisted for six months, but all subsequent men from oversea were enlisted for a year, or until the end of the war, if the war ended sooner. I also recruited many Australians at the coast ports. The majority of these were not so good as those I got direct from Australia, and were enlisted under South African rules as South African Colonials. (See notes on pay and enlistment.) The majority of the first draft of Australians were Scots, or of Scots descent, a considerable number being descendants of men who had emigrated from my part of the world. The men that I got from Australia direct were easier to manage and better disciplined than those I got as time-expired from Australian corps, and who re-enlisted in preference to going home. This I put down to having been under officers in their original corps who did not know how to keep discipline.

Canadians.—Towards the end of the war, Lord Kitchener authorised me to apply for 400 Canadians. These were authorised by Mr. Brodrick, but the Canadian Government were against the scheme, and preferred to send a contingent of their own, distinct from the Scottish Horse. I had made private arrangements in Canada for recruiting these men, and understood that the men were all available before I made the proposition to Lord Kitchener. As it was, the contingent sent out by the Canadian Government arrived too late, which caused considerable grumbling among the men, as their war gratuity was refused, also their medals; so, in view of any future affiliation of corps, as hereafter proposed by me, there will be no feeling against me with regard to this point, as there would have been had they come for the Scottish Horse.

The men in the regiment were classed as follows for pay:—

(1) South African Irregulars.—These men were enlisted in South Africa, and were paid at South African rates, and were not entitled to free passage home, but went home at indulgence rates if they wished to.

(2) Specially Enlisted Australians.—Under this heading came those men who were raised in Australia and attested in South Africa. These men were entitled to 40 days' voyage pay, and a free passage home, the same as other Australians, but were not entitled to special bounties, etc., given by Australian Government.

Major The
Marquis of
Tullibardine,
M.V.O., D.S.O.

(3) Imperial Yeomanry.—These served under usual Imperial Yeomanry conditions, and were recruited in Scotland.

19 Mar. 1903. These different conditions and rates of pay caused a certain amount of grumbling, but were in most cases pretty fair, and the only ones that could be arrived at without making other regiments jealous. The only case in which it did not work was that of the South African enlisted recruits, whom I got from the Scots Volunteer Service Companies when time expired. I am of opinion that these men ought to have been enlisted under Imperial Yeomanry rules, as they were picked men from the Volunteer Service Companies, and had all seen service in South Africa for one year with their regiments, and, as a rule, had no intention of remaining in the country after the war, simply remaining on as they wished to see the finish of the war, and thus felt that they had been less well treated than the raw material arriving out from home, which, of course, was a fact, though they never complained officially, having been warned of the terms before they joined.

II.—ORGANISATION.

Only one regiment of Scottish Horse was raised at first, four squadrons strong. This I commanded personally in the field, with the usual establishment allowed in South Africa for Irregular corps. As the drafts increased the second regiment was formed, and eventually the Scottish Horse consisted of a first regiment of six squadrons under a Lieut.-Colonel and a Major as Second-in-Command, and a second regiment of five squadrons, under the command of a Major with no Second-in-Command. As the regiments were working apart, I found it necessary to form a headquarters office at Johannesburg, where I remained, going out occasionally in turns from one regiment to the other. The whole of the interior economy of the regiment was worked from this office, with the exception of food supplies. All Ordnance vouchers, with the exception of ammunition supplies, were sent to me by the quartermasters of either regiment, and I arranged for drawing and supplying the articles required. I also arranged the horse supply of the regiments from this office, and all the pay and regimental correspondence outside the regiment emanated from here; also the supply of recruits, and all that was necessary for keeping the regiment going. At Johannesburg I also formed a dépôt. Every recruit had to pass through this dépôt before being posted, and, if necessary, received training. All men also had to come through this dépôt for discharge, and all men, after undergoing imprisonment, etc., before being re-posted; also all men on discharge from hospital. This latter was found to be very useful, as whenever a man was sent to the hospital, the same was reported to me by the regiment, and the hospitals had a fixed place to deal with instead of the regiment, which might be trekking anywhere. The result was that I was always able to get men quickly out of hospital as soon as convalescent, and there was no chance of their being detained in hospital as servants, grooms, orderlies, etc., as sometimes was apt to occur. In connection with this, I held a concert in Johannesburg, and, collecting about £200, was able to set up a convalescent camp, which was under the control of a medical officer, who was responsible to me for everything that went on in it. The average number of men in this camp was about 60, and, having the above funds to work with, I was able to get the men out in the field again much quicker than the ordinary convalescent camp did, especially as I was able to give them better food than regulations authorised; also, by supplying footballs and cricket sets, etc., the men got themselves fit, unconsciously, much quicker than they would have, had they been doing nothing in a convalescent camp; also, having a knowledge of the men, I was able to detect shirkers. One of my troopers was a qualified dentist, and was kept permanently on the convalescent camp establishment. I found him of great use, as the want of dentists is one of the great drawbacks in the medical organisation of the Army. The camp was always directly in charge of an officer who had been ill and was not fit for trek, and he saw that discipline was properly kept. In addition to the large dépôt at Johannesburg, I had two small advanced moveable dépôts, which kept as near the regiments as possible on the line, and when a regiment came in it usually camped near the dépôt, picked up new horses, recruits, transport, sup-

plies, etc., leaving trekwork horses, sick men, men for discharge, etc. As soon as the regiment moved off, the men were sent either into the main dépôt for discharge or to hospital, etc., and the horses to remount farms, as hereafter described. The dépôt immediately prepared for the next time the regiment came in. The regiment, in consequence of this, was far better supplied than any other irregular corps. In the advance dépôt of each regiment, I had an officer in charge, who was convalescent or unfit for trek; also two non-commissioned officers, one of whom acted as quartermaster-sergeant. These two men were also convalescents, if possible. At the main dépôt at Johannesburg I had a permanent dépôt officer for each regiment, one squadron quartermaster-sergeant, one provost-sergeant, and one storeman for the whole dépôt, and one sergeant and one corporal for each regiment for the clerical work, etc., etc. All the above, with the exception of the two officers and the squadron quartermaster-sergeant were taken from among the convalescents. Towards the end of the war, when large drafts were arriving from home who were unable to ride, I formed another camp outside Johannesburg for training recruits in horsemanship, and, to take charge of this, I secured the services of one of the Yeomanry riding masters, who did excellent work. I had especially asked the Duke of Atholl to send me men who could shoot, and not to bother about riding, as I could soon teach them enough of the latter, and I found I got better class men from Scotland this way.

Transport.—This was according to South African scale, as laid down from time to time, the only difference between Regular regiments and ourselves being that I had professional South African transport men as officers, one to each regiment, in charge of the transport. These men were chosen from the best conductors in the Army, and did invaluable work, having far better knowledge of the work required than any British officer could ever possess. Each one had a picked transport sergeant under him, picked for former knowledge in a civilian capacity, the best one I had having been an engine driver, thus having a knowledge of keeping waggons in order, wheels properly greased, etc. In addition to this, I had two sub-conductors from the transport to assist generally, but I found the sergeant much more useful and of less trouble than the conductors, who, however, were necessary on account of their knowledge of the language; but their honesty with regard to stores and mules, etc., was never above suspicion. The sergeant was especially valuable with regard to seeing the waggons properly loaded, stores taken care of, and general discipline in the transport. It is most important that this sergeant be of very sober habits, as temptations with the transport are very great.

Pay Department.—The regiment was paid at the usual South African rates as a general basis, but these were somewhat modified in special instances—i.e., Yeomanry men. The pay of these men was practically the same as the South African rates, with the exception that they got a free voyage home on full pay and £5 extra Yeomanry gratuity, which latter to my mind was unnecessary and unfair to other men in the Service. Men enlisted in South Africa got the usual rates of South African pay and the war gratuity only. Men enlisted in Australia for the corps were paid at South African rates and got a free passage back to Australia on full pay. The number of days' pay allowed for voyage home was fixed the same as for other Australians in the Australian regiments at forty days, so as to cover their expenses from the coast in Australia to their homes. All officers were paid at South African rates. When my Yeomanry officers first came out they were paid less than any other officers in the corps. This being, of course, an impossible condition of things, Lord Kitchener had them transferred to South African Irregular corps, the same as in the case of a Regular officer, from the date of landing in South Africa, so they drew the same amount as other officers in the regiment and Colonial allowance. The Australian officers were paid not at Australian rates, but at South African rates, so as to be fair all round, and if they originally joined for the Scottish Horse in Australia they got their forty days' pay and free voyage home the same as the rest of the men. Considering that it was unfair both to myself, to the untrained officers concerned, and to the men, that squadron officers should be responsible for the payment of the men on active service, I had one paymaster for each regiment, who was entirely responsible for the accounts

and payment of the men, and every detail with regard to pay, with the exception of allotments, which were in the hands of the Imperial paymaster. These men, though officers of the regiment and under me, were under the control of the Imperial paymaster, who was supposed to go through their accounts every month, so there should have been very little field for speculation or error if properly audited. At the headquarters of the regiment a book of headquarters' orders was kept, quite apart from the different regimental order books in the field, and all promotions, etc., were entered in this book before any change of pay could be authorised, both paymasters having access to this book daily. I may state that it is almost impossible for regiments in the field to know when non-commissioned officers are invalided, etc., but that I, having better access to the correspondence, hospital returns, etc., was better able to fill up the vacancies more quickly, and to prevent over-promotion than the officers commanding the regiments in the field. The regimental paymasters visited each regiment each month, and paid the men so much of their balance as they required, placing the rest to their credit, the result being that the average of pay due to the 700 men I brought home was between £30 and £40, some of them having as much as £150. (See notes on paying-off, later.) In addition to this, knowing what balances officers and men had, the paymasters were able to authorise certain expenditure on officers' and men's accounts if they wrote in for anything, such as mess stores or clothes, or if they wanted to send money home extra to the usual remittance or allotment. No Imperial Paymaster would have had time to do this, and no squadron officer in the field could possibly have done it. In Irregular corps it would have been impossible to trust every squadron leader with the money, partly because of ignorance of their previous character and partly because they were not sufficiently well educated. Also I wished the whole of their energies devoted to their squadrons and to fighting the enemy. Each paymaster had a staff of one non-commissioned officer of the rank of quartermaster sergeant, one sergeant, and one corporal. It was necessary to give these high ranks to the men, as they were living in Johannesburg, and expenses were big, and also in order that there should be no excuse for speculation, as they were sufficiently well paid to be comfortable; besides it was necessary, so far as possible, to have trained business men, Army men not being available. I consider it absolutely necessary, if the above system is continued in future, that the senior N.C.O. should be a trained Army pay-sergeant. This would cause considerably less trouble to the Imperial paymasters concerned. I may state here that the only department that ever caused me trouble and did not assist was one of the departments of the Army Pay Department. By this I do not in any way reflect on the Chief Paymaster, who did his very utmost to help me at all times, but the actual department which Irregular corps had to deal with. Instead of being assisted, the regimental paymasters were, as a rule, very discourteously treated, and were never really told exactly what system to follow. The result was that many mistakes occurred which might have been avoided. No proper regulations were framed when the regiment was first started, and having no Army non-commissioned officers at that period, the books were apt to get muddled from an Army point of view, and I had far too much to do to be really able to check them. The regimental paymasters also would come back from Pretoria very much ruffled in their tempers, and in consequence did not play up so well as they might have done had they been more led than driven. This complaint was not peculiar to my corps, but was a universal one among all corps dealing at the same office. It must be remembered that it must have been even worse in other corps where there were no Regular officers to assist the paymasters. I have said the above not owing to any enmity against any particular officer concerned, but as I think it my duty to point out that to get the best results it is absolutely necessary to have a courteous station paymaster (who can be as strict as he likes) to deal with independent Colonials, who will do anything for you if treated courteously, but get very obstinate, and will try to thwart you at every point if treated otherwise, and in consequence the Public Purse suffers.

Allotments—Great difficulty was experienced with the first three squadrons which came out from home owing to the allotment papers never having been received, and having only the men's word to go on. In the case of one squadron they were received one year

and five weeks late, so far as I remember, and the men having a very hazy idea of the difference between allotments and remittances much confusion occurred, and in some cases went at home. Although I have no official knowledge of the same, I am under the impression that the allotment sheets came out in due course, and were sent to the Yeomanry authorities in South Africa, where they got shelved at Cape Town, as, when change of paymasters was made in that department, they suddenly appeared within a week of the new paymaster taking up the work. With regard to this point I may state that Colonel Mortimer and Major Molyneux (Station Paymaster, No. 2), did everything they could to get the allotment sheets. I should here like to place on record the great assistance and tact always shown by the Chief Paymaster.

Major The Marquis of Tullibardine, M.V.O., D.S.O. 19 Mar. 1903.

Arrangements for Pay on Demobilisation.—On going on board ship for the voyage home I found that the men had so much pay due to them that it would have been very injudicious to have given them all the money, first, as there was a large amount of illicit drink on board; secondly, as about a hundred Reservists on board had formed a "silver ring," I having only gold for my men. These Reservists had been paid in some cases about £20, and what they did not spend on drink they spent on gambling, and if any of my men wanted change for canteen, etc., they were forced to take 15s. for a sovereign. To check this I issued bank notes (specimens of which are shown below) to the value of 2s., 1s., and 6d. My men were paid

in these notes only. They were made the only legal tender at the canteen, and the only legal tender for beer, and I gave full value to any men in exchange for money. This very soon stopped all abuses on board. These notes were redeemed the day before landing, and were illegal tender for any of the ship's crew, and could not be redeemed by them. The result was that the crew were unable to sell drink as it was too risky to give the men credit. There was no redress if a man lost the notes, and any surplus gained through lost notes by the regiment was placed to Widows' and Orphans' Fund. I am of opinion that a great deal of good could be done by issuing notes to men on transports the day before leaving in lieu of pay—these notes to be redeemed at their depôt on date of arrival only, after which the notes should be immediately destroyed, so that they could be of no use afterwards to anyone who should have stolen any of them, or to the crew on board ship on subsequent voyages; different numbers, patterns, or colours being used on every ship. Care should also be taken that the type used was one which could not be forged on board the ship. Men on landing were paid £2 at Aldershot to meet current expenses, and all men were paid in full within five days of going to their homes by myself and my Adjutant, with the exception of details, and two or three men whose accounts had not been forwarded by mistake. This, of course, refers to the bulk of the regiment which came home with me, and not to the odd details who came home at various other times, with whom I did not deal.

Horse Supply.—Horses were drawn direct from the Remounts when required. Close to each advance depôt I had a permanent horse depôt of my own in the nature of sick horse lines. The horses were kept in kraals and tin sheds built by my natives and by my convalescents. At each of these depôts I had a selected officer, two picked Australian troopers, as many natives as necessary, and one farrier. Whenever the regiment came in off trek the worst of the horses were sent to the Army sick lines, but those that only wanted a fortnight's rest were sent to this sick horse depôt. All horses from the Remounts were sent to these depôts two or three days before the column came in. The regiment used to wire to me how many horses they required to complete, how many sick they were sending in, and if I had enough to supply them out of the depôt I used to have the horses waiting for the column taken from those that had been sufficiently rested at the depôt, or from those sent up to complete establishment by the Remount Department. The Remounts used to give me new horses for those that were sent to the Army sick lines, and used to replace death casualties, but did not replace horses that were simply sent into my depôt to rest, horses of men sick in hospital supplying the necessary working balance. This system gradually grew up, but was not in use at first. Colonel Birbeck reported very well on my depôt, and when Regimental Horse Depôts were done away with, that of the Scottish Horse was the only one allowed to go on. The reason of the success of mine was, of course, because the commanding officer was on the spot, and horses were very carefully checked and looked after. Horse Depôts under the charge of the average Colonial Corps would become a source of constant speculation, not only in horseflesh, but also in grain. With cavalry regiment depôts, too, I noticed that horses and ponies which were not worth their keep were often kept going because they were old friends, or because some non-commissioned officer wanted to show how he could bring a horse round after it had been given up by a veterinary surgeon, which resulted in little good, as a rule, to the horse, and none to the Government; also ponies suitable for polo were very often allowed to remain in the depôts longer than was otherwise necessary. Therefore I think that column depôts are far preferable to regimental ones, except perhaps in the case of a very big unit, as mine was, as a column can always spare a good officer to be in charge, and abuses are less likely to creep in. From a regimental or column point of view these depôts were useful, as one knew exactly how many horses one could count on when coming into the line, instead of being disappointed in getting horses from the Remounts owing to all available horses in the Army Remounts establishment having to be sent away to another part of the country to make good the loss caused by some reverse. Of course, it would be impossible to have these depôts against an organised foe as they would be captured at once. I tried giving a 40 per cent. extra supply of horses to one squadron for a short time, which turned out very expensive in

horse flesh, as the men took no care of their horses, knowing they could always get another one. Eight per cent. or 10 per cent., however, led by servants, etc., or ridden by camp followers, are extremely useful and I found that better care was taken of them if they were handed over to squadrons to be used as they chose, and not locked after regimentally and handed out regimentally, as they were better taken care of, though, of course, in cases of necessity squadrons had to give them up, but in cases where squadrons lost their horses through neglect I made them walk rather than take the spare horses from another squadron which could look after its horses well. From what I saw when attached to the First Cavalry Brigade, in Natal, in 1899-00, I found the best-bought English horses did best. With the Scottish Horse, the Walers were the best class of horse, but took too long to acclimatise, and, taken all round, the best bought American horses did, perhaps, best. For mounted infantry, when the pace was not too fast, there were no better or more tractable mounts than the Russian ponies. The Russian horses did not do so well. I went with Lord Downe round my second regiment, which had just been supplied with the first issue of Russian horses. They were not a good class, and had been issued before they were really fit, and, in consequence, did badly, but after he left for Australia I was issued with very large quantities of Russian ponies, which had had a good rest after landing, and were given light work in my depôt before being issued to the regiment. I had no better ponies for the purpose required than these, but they were too small and slow for cavalry, but suited the Scotsmen to perfection, while I issued my bigger horses to the Australians. The Argentines were of low class, and the Hungarian ponies quite useless.

III.—OFFICERS.

I got my supply of officers (a) from the regular Army, (b) appointed at home by the Duke of Atholl and posted as Yeomanry officers, (c) appointed in South Africa on raising the corps and at other times, and (d) through the ranks of the regiment. Class (a).—My regular officers got on extremely well with the men and were thoroughly respected and trusted by them. At first the Colonials were against having them, but when they found what a difference it made in their comfort and in general efficiency they preferred them to any others. I only got officers whom I knew about personally. The commanding officer of each regiment and the adjutant were regulars. Class (b).—The officers appointed at home were of a less affluent class than that from which officers are usually drawn, and did extremely well, and could be thoroughly trusted, but were deficient in horse knowledge and general training. I was particular that they should be of gentlemanly behaviour. Class (c).—With the exception of the Regular officers, as a class, these were the best and most useful officers I had, as they were selected from (1) Australian regiments going home, (2) men of considerable experience throughout the war and in South Africa generally, and (3) gentlemen who had settled in the country just previous to the war, or who had served in the original Yeomanry. Class (d).—Some of the most reliable officers I had were appointed through the ranks. They were of all classes, and were promoted purely on their merits. Many of them were not what is termed gentlemen by birth, but I never kept a man who could not behave himself. Perhaps almost the best officer I had in the corps had been a farm hand and was the son of a small farmer in Perthshire, while another had been a footman in civilian life. This last fact was, of course, only known to me.

Of course, especially in Class (c) I made some wrong selections before I had got the necessary experience; but I always turned an officer out at once who did not behave himself, or who was addicted to drink. I consider that it is absolutely necessary for a commander of an Irregular corps to have the power of dismissal of any officer or man, reporting the same to the General Officer Commanding. My chief difficulty with regard to Irregular officers was drink, and the standard of moral code in those regiments which were not commanded by Regular officers was in some cases extremely low, and lowered the standard of the men in consequence. From first to last I had 157 officers, 14 were killed or died, seven were invalided, 11 were removed or resigned at my request, 107 served to the end of the war, and the remainder resigned for private reasons. The officers were supplied—from Regular Army 22, appointed in South Africa outside the Regiment 78, through the ranks of the regiment 46. and at home 11. I may here state that having started

so late in the war, the supply of officers of higher class was extremely limited, and I had to do the best I could otherwise. In my estimation a man known as a gentleman at home makes the best officer, as if you give him an order you can be tolerably certain that it will be carried out, his only fault being that he is too much inclined for luxury, having independent means. By this I do not mean that I do not approve of "messes"—as I do—considering that officers require to a certain extent the food they have been accustomed to, and also that they require better feeding than the men, owing to their having to use their head more, and being put to a greater nervous strain. Men also infinitely prefer to be commanded by a gentleman. In certain cases, of course, certain men in lower stations in life proved themselves so eminently fitted for promotion that everyone was pleased to see them promoted; but these were rare examples, and their merits can only be found out in a protracted war—in fact, I think in every case they had seen service for upwards of a year previous to joining the Scottish Horse, in some other corps. The worst of this class of officer also is that he is too keen for his own squadron and not enough for the good of his regiment, so, incidentally, for the furtherance of the Army in general. If he can get things for his own squadron he is not very particular how he gets them, and if the cause in general suffers. Except in rare cases, though an excellent man fighting, he is apt to neglect camp duties, and, in consequence, the comforts of his men, very often not understanding that an officer must be ready to do any extra work that he is called upon to do. I found the Australian officers sometimes too apt to be too familiar with their men, and discipline suffered in consequence, and, at other times, they were too apt to be down on their men, but, generally, as subaltern officers, once they learned their duties, owing to their previous roving life in Australia, they were magnificent troop leaders and horsemen. From first to last I never had any friction with any of my officers, and they all backed me up so well that I could not have carried on the corps had they been less keen and efficient. Taken as a general whole, the officers of the Scottish Horse were, with the exception of such corps as the Imperial Light Horse, South African Light Horse, and Thorneycroft's Mounted Infantry, superior to those in any Irregular corps.

IV.—SPECIAL QUALITIES.

(A) Shooting.—Taken as a general whole, the Scotsmen from home were good shots owing to the large percentage of Volunteers, keepers, and farmers joining. They were more cool also in action. Australians.—Shooting indifferent, in majority of cases very bad, owing to inexperience. Excitable in action. South Africans.—One or two very fine shots among them, but the majority were indifferent. (N.B. It must be noted, however, here and elsewhere, that I never had the class of South African men who enlisted in the Imperial Light Horse, for example, at the beginning of the war.

(B) Scouting.—The Australians were magnificent scouts, but a little apt to romance. The South Africans were very apt to romance, and, in consequence, their reports were treated with suspicion. The Scotsmen—if you could get any who rode well enough—were the most reliable of all, but from a general point of view, owing to his fine horsemanship, the Australian was far away the best scout, though a good Highland stalker could give points to many men.

(C) Horsemanship.—Australians: Magnificent. Scotsmen: Very bad, but owing to perseverance and sense of pride in that they did not wish to be worse than others they improved quicker than any untrained men I had, and in six weeks they were quite as good horsemen as the average mounted infantryman and much better than the average yeoman who came out towards the end of the war. South Africans: A few picked men were excellent, but the majority were indifferent.

(D) Horsemastership.—The Australians knew most about horses, but owing to their being accustomed to getting a large supply of horses in their own home they were apt to use up their horses too quickly. Had they been less good horsemen they would have been better horsemasters, but the best Australians left nothing to be desired in this respect. The South African enlisted man was a bad horsemaster, and had none of that love for a horse which is so strong in an Australian. Scotsmen.—Very fair horsemasters, owing to their ignorance about horses and their willingness to do exactly on all occasions what they were told to do; also they seldom

had any ambition to gallop their horses, but preferred to go quietly.

Major The
Marquis of
Tullibardine,
M.V.O., D.S.O.

V.—MISCELLANEOUS.

I consider that one of the great causes of the success of the regiment was its *esprit de corps*, a direct result of its name, as the men felt they were representatives of a national regiment, and knew that if they did badly they could not show their faces at home again.

The success of the corps was also very largely due to the very excellent Regular officers who served under me and in command of the regiments in the field. Had these officers been less excellent and not had the welfare of the corps so much at heart, I feel sure that the regiment would not have occupied the position it did among South African Irregular corps. The officers I especially allude to are Lieut.-Colonel Leader (Carabineers), Lieut.-Colonel Duff (8th Hussars), both of whom commanded the 1st Regiment at different places; Major Murray (Black Watch), commanding 2nd Regiment, since killed; Major Blair (King's Own Scottish Borderers), second in command, 1st Scottish Horse; Major Jones (I.S.O.), commanding 2nd Regiment after Major Murray; Captain Lindsay (Seaforth Highlanders), adjutant 2nd Regiment, since killed; Captain Watson (Dublin Fusiliers), adjutant 1st Regiment, killed; and Captain Lord George S. Murray (Black Watch), adjutant 1st Regiment after Captain Watson, and Captain Sir W. Dick Cunyngham. The success of the regiment was owing to all the above, especially Lieut.-Colonel Leader, Major Murray, Major Blair, and Captain Lord George S. Murray.

The discipline the whole time was excellent, any crime that there was being, as a rule, confined to old soldiers. On the whole the discipline was more strict than in most Colonial regiments, and the men were required to behave the same as men in the regular service would have to. The only trouble I ever had with any of the men was with about eighty of the 2nd Regiment, who mutinied at Standerton. The men had considerable cause for complaint, and I anticipated insubordination. As the cause for the insubordination was a purely local one, and the men concerned were only a small detached body who had had a very hard time of it, I do not propose to enter into any further particulars, especially as the men found afterwards that they had been misled by certain discontented men, and all came back to duty again, with the exception of the ringleaders, who were punished.

VI.—DIFFERENT CLASSES OF MEN COMPARED.

I found that the best type of men were not what might be described as the high-class yeoman farmer, but men who had been accustomed to hard outdoor life, such as small farmers, farm hands (when sufficiently intelligent), keepers, stalkers, outdoor carpenters, plumbers, and masons, woodmen, etc. The men from the towns were just as good in spirit, but lacked the endurance and powers of vision of the above, and were considerably more difficult to manage when times were bad.

VII.—SPECIAL SCOUTS.

The special feature of the regimental organisation was two troops of scouts, fifty in all, attached to each regiment. These men were selected for their scouting powers. In the 2nd Regiment they were all Australians, and captured practically every prisoner taken with the column when under Colonel McKenzie. The scouts of the 1st Regiment were a mixture of selected Scotsmen and selected Afrikaners, and were the most useful body of men I had. They all drew extra duty pay while serving with the scouts, and a man was regularly reduced from or promoted to the scouts from the regiment. They did no guards or pickets, but had to be ready to turn out at any time. Although these men were under fire nearly every day, and used to wander great distances from the column, I had far fewer casualties among the scouts than among any other men in the regiment, owing to their being able to look after themselves. The great majority of the prisoners captured by the column under Colonel Kekewich was due to these 50 scouts. The regiment always found the ordinary scouting party required of a regiment, but the scouts were used over and above this, and at far greater distances. Attached to the scouts of each regiment were ten to twenty Zulus, whom we provided with Boer ponies, and they proved invaluable also. The only other regiment which I saw in South Africa adopt this principle a

Major The
Marquis of
Tullibardine,

19 Mar. 1903.

the beginning of the war was the 5th Dragoon Guards, and they did it with great success. In my opinion it is impossible to expect every cavalryman to be an efficient spy, as opposed to the term scout, as usually understood in a drill term in a cavalry regiment. In the present Yeomanry I am raising in Scotland I am making one troop entirely of stalkers for this purpose. The scouts should be armed with one leather bandolier only, a carbine, and a pistol, if possible, so that they may be as mobile as possible, as they are never expected to offer serious resistance, and if they have to, it is bound to be at close ranges. Although the whole regiment was there, my scouts were mainly responsible for capturing Sarrel Albert's commando in February, 1902. Scouts should be changed the moment they show signs of losing nerve, which often happens owing to the risky nature of their employment.

VIII.—THIEVING IN HOSPITALS.

The only complaint I ever had to make outside my regiment, with the exception of the aforesaid complaint re paymaster, was the thieving of men's kits in hospital. In hardly any case, excepting from Rustenburg Hospital, do I remember a dead man's effects being returned to the regiment intact. It was impossible to obtain a conviction, and very great annoyance was caused among the men and their relations owing to this cause, and it often put me in a very difficult position, as it was impossible to explain to the men's relations exactly why the kit was not forthcoming, in the interests of the service. I feel sure some better system might be devised for hospitals. When I refer to kit I refer to pocket books, papers, and watches. As a rule a man's money was properly looked after. Of course, one cannot blame the hospitals for this entirely, as a very great number of men who were employed as hospital orderlies were men whom their regiments did not want to claim, or whom they sent to hospital if ordered to send orderlies, owing to their not being wanted in their regiments.

IX.—SUGGESTIONS FOR ORGANISATION AND EQUIPMENT FOR THE FUTURE.

(1) Officers.—I am of opinion that commanding officers and seconds-in-command for Irregulars, Australians, Canadians, and Yeomanry should be Regular officers only (if possible, still serving and up to date). Ditto adjutants. I never heard of a good corps in South Africa that was not commanded by a Regular officer (really if not nominally) in the field, and which had not got a Regular adjutant. All these men should be picked for good all-round soldiering qualities, and should be picked as being good horsemen, a quality which all Irregulars admire. They should also be men with a very good command of temper and with a certain sense of humour, and ready to take things on their own shoulders, and they cannot err on the side of strictness in discipline in those points which are most essential for the well-being of a regiment. It is also necessary that every man should know he can approach his commanding officer at any time if he wishes to, but at the same time men must know that frivolous complaints will be suitably dealt with. It is fatal for these officers to be anything but strict with regard to the discipline and general behaviour of the other officers of the regiment. An excellent example of the result of good and bad officers was seen in the case of the 5th Victorians, whose commanding officer was inefficient, and the officers and non-commissioned officers generally inexperienced. The regiment came to grief. They had no Regulars. My Victorians came by the same ship and were the same class of men, in many cases brothers, and no men did better. Non-commissioned officers must be picked for sobriety, owing to the temptations in all Irregular corps.

(2) Future supply of officers.—The difficulty with the new Yeomanry in Scotland will be to get good officers without descending to the class of officers who are now often being chosen for the Volunteers, the best class to get being younger sons who cannot afford to go into the Army, or small lairds who have not got sufficient to occupy them at home. Both these classes will be available in case of war where the richer or more busy men cannot afford to go out; but it will be impossible for these former gentlemen to spare enough time from their business to go through the prescribed preliminary Yeomanry training with a cavalry regiment, as they can ill afford either the time or the expense. The only way to have efficient commanding officers, and trust them to train the officers to the best of their ability and to see that they do their regimental trainings, and experience proves that it is not a precise knowledge of drill

that is required but how to apply it with a general knowledge of system and common sense and how to command men. One of the best-drilled regiments I saw in South Africa, from a parade point of view, being, when it landed, one of the worst in the field. The best Colonial officers were the best local men who volunteered for the war, and not the men in the existing semi-permanent corps. This was especially the case with Australians, some of whose semi-permanent officers had lost all sense of initiation, but were full of drill in its worst sense.

(3) Replacing non-commissioned officers on active service.—The present establishment appears to be all that is required, but when non-commissioned officers are a long time in hospital or unfit for trek, regiments should be allowed to make acting non-commissioned officers in their places—the same to revert, if necessary, to their former rank on the return of the absent non-commissioned officers to duty. I would not recommend these acting non-commissioned officers to have, perhaps, full pay of their acting rank, but they could have some extra duty pay while thus acting, and the temporary rank while holding the appointment. An Irregular trooper can never understand why he should do a sergeant's work without a sergeant's emoluments, and it is very necessary to have a good establishment of non-commissioned officers on service.

(4) Employment of Regular non-commissioned officers.—I consider that there should be a Regular quartermaster, a Regular regimental sergeant-major, and a Regular regimental quartermaster-sergeant in every regiment, and that every squadron should have a Regular non-commissioned officer acting as squadron sergeant-major. It is not fair on Commanding Officers, or on the men, or in the interests of the Service, to have any of the above positions filled by Irregulars, both from points of economy, as they save much equipment and waste, and from the point of efficiency. In South Africa it was always a fight to get hold of a Regular non-commissioned officer or officer. A Regular farrier-major would also reduce the horse bill considerably. It might be possible to have a few extra non-commissioned officers in every infantry battalion and every cavalry regiment with acting rank and paid less than a full non-commissioned officer, who were under instruction in the duties of a non-commissioned officer, but required to perform the ordinary duties of their rank. This would not only provide a school for the regimental non-commissioned officers, but in the event of war would enable the War Office to call upon every regiment to provide a certain number of non-commissioned officers for Irregular corps, Yeomanry, and Volunteers.

(5) Veterinary Officers.—Although it has been stated by many authorities that veterinary officers are no use in the field, no brigade should be without one, in my estimation, especially in a country like South Africa, where there are so many poisoned grasses and special diseases, which, if treated immediately in the proper way, can often be cured. I am also of opinion that a good non-commissioned officer, under the veterinary surgeon, in addition to the farrier-major, whose time is fully taken up looking after the shoeing, is very desirable for the purpose of looking after mobile sick lines for slight cases with the regiment. This was not authorised in the South African establishment. In fact, in one regiment I had to return this non-commissioned officer as a trumpeter-sergeant, and in the other as a hospital-sergeant, both of which were unnecessary, and were done without a trooper being sufficient for these appointments.

(6) Farriers and Signallers.—With regard to farriers, I found it was better to work them regimentally directly under the farrier-major, and they messed together, and worked almost like a troop. I tried to prevent them as much as possible from going into the firing line and getting injured, as their services were too valuable, and the work was very much better done when used regimentally, as it often happens that the shoeing smiths in one squadron might get reduced in numbers, while a weak squadron might have its full complement of farriers. In this way each man got his fair turn of work, and, if a squadron or troop went on detachment, a proper proportion of farriers went with it.

The signallers were worked in the same way, and I feel sure that all signallers should be regimental, and only sent out with units when required.

I consider that more facilities should be given Yeomanry and Volunteers to learn signalling.

X.—EQUIPMENT.

With regard to equipment, the web bandoliers served out in South Africa were found useless, and were returned to store as they worked loose and lost the ammunition. Two shoulder bandoliers of leather, and sometimes a third round the waist, are quite sufficient for mounted troops if extra ammunition was carried on pack mules. For Yeomanry or mounted infantry, I consider bayonets essential, especially for night attacks, either offensively or defensively. A proper system of carrying the rifle still remains to be devised. It is impossible to expect men to carry a heavy rifle all day in one hand, and shoot properly at the end of it. No one who has tried to carry a magazine rifle on his back ever wants to carry one again. The small buckets for the stock of the rifle worked fairly well, so long as the man was forbidden to hold the rifle in his hand, and swung it on his arm with a short arm loop attached to the muzzle, otherwise, if he used it as a walking stick to support himself in the saddle it gave a sore back, and no inefficient horsemen, such as the Yeomanry are, can be expected to ride properly and hold a rifle in their hands at the same time. If the rifle were a little shorter, a good idea would appear to be an invention of Lieut.-Col. Paterson, of the Imperial Yeomanry, for hanging it on the body, but I never saw it practically tried. I am quite certain that Regular cavalry should stick to their swords, in addition to their rifle, and Australians could do well with a sword though untrained. During warm weather, a good jersey and a waterproof, or "a British warm coat" and a waterproof are found useful for the men, and slightly lighter than a greatcoat, but a good khaki greatcoat would be of more general use. Woollen gloves served out in cold weather would be most useful, but otherwise the clothing of the army was most complete. The greatcoat should not be rolled and fastened to the saddle in the usual cavalry manner, which not only fills up the saddle, but is inconvenient, gives a sore wither, and is impossible to roll up properly when wet, and never gets a chance to dry. I found the best way was to turn the sleeves inside out, fold the coat over, and lay it across the back of the saddle, flapping loose, with only one strap in the centre. This was easier for the horse, easier for the man, and better for the coat, and was adopted practically by most regiments, and the eye would very soon get accustomed to it at home for parade purposes. The cavalry pattern saddle was, without doubt, the best for the horses, but is capable of being lightened and improved, the burrs in front of the side bars are quite unnecessary, and interfere with the play of the shoulder. The enormous wallets now in use were never used in South Africa towards the end of the war. Very much reduced wallets fastened in the same way might be used, just large enough to hold tobacco and a pair of socks for the men, but hardly anything else is required. Should a man carry anything else, it should be carried in his haversack or pocket. A shirt can always be carried in the pocket of his great coat. If he is going light, he requires no more than this. If he is going with transport, his spare pair of boots and a grooming brush can be carried rolled up in his blankets in the waggon. Mess tins were found preferable to billies, and very soon lost their shine when cooked in, but it is a good plan to paint the outside of them with khaki paint to start with. Nosebags are most necessary, and, if made of stronger material, would last longer, but are always so badly looked after that this is hardly worth doing. One set of shoes per section or group is quite sufficient, and can be carried divided among the men, the remaining shoes of the regiment being carried by the farrier-major's cart. The enamel water bottles usually served out are excellent, but the tin ones served out when these ran short in South Africa were no use at all. The stirrups generally served out were much too small to take the men's ammunition boot, many accidents occurring from this cause. The boots served out to the men were very much too heavy, and were conducive to bad riding, as the men practically lost all sensation in their feet, and were slow to get on and off. Haversacks should be of stronger material. Corn Bags. —In the Egyptian Army we used to carry small corn bags, which held two or three good feeds. Corn bags were never used in South Africa, and the ones of English pattern are too big and clumsy, but I feel sure that the Egyptian Army's small cornbag, neatly rolled in front of the saddle, if the great coat is carried, or at the back if it is not carried, would help the mobility of a force immensely, and the weight grows lighter on the horse as it eats its meal. The men's spurs were

much too big and sharp for mounted infantry. Spurs are necessary for tired horses, but the rowels might be less severe, and very short necks should have been provided on the spurs for all mounted men. Also a leather strapping on seats, as well as inside knees, of men's breeches would be a good thing, and probably eventually save money. Two Maxim guns, and not one, should be attached to each cavalry regiment, if the regiment is strong enough and trustworthy enough not to have them captured. Two are better than one, as they can support each other if worked apart. On all occasions tripod mounting should be carried on pack saddles, in addition to wheel mounting—the tripod not being carried on the gun carriage, but on a horse, the gun, as a rule, being carried on wheels, with a spare horse carrying the tripod mounting handy, so that in case it sticks, or rough ground is encountered, it can be quickly placed on the pack saddle. This is especially necessary, and ought to be a regulation, if there is any shell fire. In this case, no wheeled Maxim can stand up against shell fire, but a tripod Maxim can be hidden and used to great effect. The gun carriage, in this case, can be used to great advantage as a dummy to take in the enemy and draw their fire, as a tripod Maxim, when carefully worked is quite invisible. I was in charge of Maxim guns during the relief of Ladysmith, and in that country, and under that fire, wheeled Maxims could not be used, but in the latter part of the war wheeled transport was preferable. Pom-poms, I consider, are too expensive and too valuable to be attached actually to regiments, but should be worked by gunners. They are very useful with mounted troops. These remarks refer, of course, to irregular corps. A battery of "Pom-pom," split up among the different regiments of a regular cavalry brigade, each section being trained in peace time with the regiment to which it will be attached in war, so as to know the various cavalry signals and customs of the regiment would be useful. Water Carts. —I am certain that a fruitful source of enteric was to be found in the water carts, which were never really properly cleaned, and I feel sure that an oil or other stove could be arranged underneath, without much extra weight, and, if filled in the morning, and fire lit during the march, the water could be boiled, and would be cooled by evening. This would sterilise the water, keep the inside of the cart pure, prevent the men from looting the water en route, and would help to have teas, etc., ready at the end of the march. At all events, even if not regularly boiled through lack of fuel, it would ensure the cart being properly disinfected every two or three days.

XI.—TRANSPORT.

I consider that a cart of the capacity of a Scotcl cart should be given every regiment to carry the veterinary surgeon's equipment, extra shoes, farriers' tools, etc., i.e., the heavier ones. Field forges should not be carried on the march with the first line of baggage, but are invaluable if carried with the main transport. Great mobility would be obtained if each troop was given a small four-wheeled cart of light build which would hold the kits of five-and-twenty men; thus each squadron would be supplied with four of these instead of two larger wagons. Two horses or six mules would pull these smaller wagons. It very often happened that a troop had to be sent away to some out-lying post just after coming in off trek, or even sent as a detached post for several days. They always had to go without transport as the squadron had to retain the wagons. The carts, being much lighter than the squadron wagons, could be drawn by spare troop horses with sore backs, etc., and would assist in making the spare horses in a squadron of use. These wagons should, however, be under the control of the colonel of the regiment, who would be responsible that they were not overloaded, otherwise the usual friction with the transport officers would occur. A light four-wheeled trolley with low rave boards would be the best type of vehicle.

XII.—TENTS.

Men infinitely preferred to make shelters of their spare blankets to sleeping crowded in a tent. If tents are to be issued on active service, green bivouacs, such as the Natal Police use, are easier carried, preferred by the men (if not more than two are put into one bivouac), and are much less of a mark for the enemy; also in the event of a surprise it takes a large force of an enemy to stop the men getting out owing to their number and distribution.

Marquis of
Tullibardine,
M.V.O., D.S.O.

19 Mar. 1903.

XIII.—RATIONS.

If a tinned ration of bread could be carried, or a softer biscuit, it would save many men going sick from indigestion or want of teeth. Emergency rations were never used except at the beginning of the war, as the men could never be got not to use them as soon as served out. Very great inconvenience was caused by mounted men being served out with enormous 7lb. tins of bully beef instead of with the ordinary 1lb. tin. The result was that the men threw them away rather than carry them, thus getting low in condition through insufficient food. The cheese and bacon rations were much appreciated by the men, and also the jam ration, which, however, was rather large, as the men ceased to appreciate it and used to give it away to the Kaffirs; also it went bad in about 8 hours after being opened. Brawn, mutton, and beef were always appreciated, especially mutton. Maconochie's rations were good as a change, but if given too frequently were too heavy for the men with weakened digestion, and were apt to go bad. The Maconochies issued in South Africa were much richer and more sickly than those issued in Egypt in the last Soudan war. As a luxury, no ration was more appreciated by the men than the chocolate ration which was served in lieu of coffee but it would have been better in lieu of tea, which was not so much appreciated by the men as coffee. This refers especially to irregulars, who were not accustomed to the "peculiarities" of ration tea.

XIV.—REGIMENTAL PAYMASTERS, ETC.

I consider that all mounted Irregular corps, and Yeomanry, Colonial corps, etc., should be paid on service at the same rates, as it causes an enormous amount of trouble when all are paid at different rates as mine were, and it also causes grumbling. Special bounties by Colonies to their officers should not be encouraged. Further, I consider the system of regimental paymasters a sound one, and the only workable one on service, and also that it is a *sine qua non* that all Irregular corps should have a trained army pay sergeant attached—even if only a clerk with temporary rank. A proper system for staff at headquarters of the Army in the field, such as Assistant Adjutant-General, Colonial forces, etc., should be formed before the war. This officer should have sufficient staff to allow him to go and visit Colonial corps in the field from time to time. He should be a senior man with readiness to act on his own responsibility, as he often has to give decisions off-hand, and he should be an officer who can leave well alone and allow those under him a pretty free hand if doing well—good address is everything with Colonials, and they are always grateful for help. A fixed establishment, rates of pay, and all Standing Orders and regulations, as simple as possible, should be prepared and ready to issue in the event of war.

XV.—CONCLUDING REMARKS.

Recruiting in South Africa.—If this is ever necessary again, more care should be exercised in selecting recruits. Irregular recruiting officers and non-commissioned officers are often apt to be unscrupulous in recruiting men. It is best to let regiments recruit the men, as they work better for their own corps and get more men, but all men should have to pass a Regular officer and a Regular medical officer at a central bureau. The medical examination should be more strict, and good teeth (if biscuits are used) are absolutely necessary. All men who are discharged with ignominy should be notified to this office, or who are invalided out, or drawing pension, so as to prevent re-enlistment.

I consider Australians should be armed with swords as well as rifles, as, being such fine horsemen, opportunities may occur in European and native warfare where shock tactics, though undisciplined, would be very useful, even by untrained swordsmen.

I also consider that six months is too short a period for which to enlist Colonial troops, as, just as they are beginning to learn their work their time is up, and a man is always more trek-weary and home sick at the end of his six months than at any other time of his service. It is also expensive.

It is a great mistake also to enlist an inferior class of men, as they lead to disaster and they stop good men from joining. It is better to be weak for a little time and take more trouble in getting recruits, unless, perhaps, as was the case in South Africa, it was necessary to enlist as many people at the coast as possible for

political reasons, which was, I presume, the only reasons why some of the men were enlisted.

Another point I did not lay sufficient stress on was the intemperance of the average Colonial officer. Commanding officers cannot be too strict with regard to this point, as it often leads to trouble.

The great thing to teach Yeomanry is to ride, shoot, and scout, and nothing else should be taught. People are apt to be lulled into false security by the success of the Yeomanry in South Africa. Against European forces the second lot of Yeomanry that went to South Africa would have been, not only useless, but a source of danger. The first lot, I believe, were good, but I never saw them.

The men of Lovat's Scouts and the Scottish Horse were infinitely superior as fighting men to the second lot of Yeomanry, but even when as efficient as they were at the end of the war they would have to be very cautiously used if there was much trained cavalry opposing them. Further, it must be remembered that a great many men enlisted as they wished to emigrate and wanted to have a look at the country first, so they must not be counted on too much to go abroad another time, but for home defence they would be invaluable. If required for home defence, care should be taken not to drain the country of suitable horses as was done in the late war, as, in the case of invasion, the horse question would be an acute one.

My ambition is to raise a Scottish Horse Volunteer Corps in Canada and Australia, under local conditions purely. Before I left the Transvaal I started one there from among my old men and others, and there are over 300 in it now. In the event of war, all these would amalgamate, and 4,000 men would be provided at once, taking

1,000 from Scotland,
1,000 from Canada,
1,000 from Australia,
1,000 from South Africa,

and kept up by their respective Colonies.

SERVICES OF THE REGIMENT.

First regiment served under command of Lord Tullibardine in Colonel Flint's column in the Western Transvaal, afterwards with Colonel Shekleton's column near Klerksdorp and Potchefstroom. Later, under command of Major Blair, King's Own Scottish Borderers, under another brigadier. At this period the officers and men did not hit it off with the brigadier, and did not play up, the only fight being at Slipstein Kopjes, where my cyclists were left by accident, resulting in the capture of several of them. Casualties, two killed, one wounded, two officers captured and five men. But this General did not stay long, and was followed by General Dixon. The regiment then rapidly improved in morale, and Lieut.-Colonel Duff took command. The principal fight it was engaged in at this time was that at Vlaktefontein on May 29th, 1901, when the casualties were one man killed and one officer and four men wounded. The regiment, however, was hardly engaged, the enemy's attack being on the Imperial Yeomanry and infantry, the Scottish Horse only coming up late in the day from a raid to the east, and fortunately assisting the infantry to retrieve the day. When Colonel Dixon was appointed to another command Colonel Kekewich took over the column. Under this officer's magnificent leading the column then became one of the most useful in the country, being only equalled by Colonel Benson's for numbers of prisoners taken. The regiment improved rapidly. The first serious fight was when Delarey surprised the camp at Moedwill on September 30th, 1901. The Scottish Horse casualties were three officers and 17 men killed, 12 officers and 43 men wounded. The regiment, owing to the greater part being away on command, were very weak that night, and behaved splendidly.

Soon after this Lieut.-Colonel Leader (Carabineers) took over the command from Lieut.-Colonel Duff, who took over his own regiment, the 8th Hussars. To Colonel Leader is due the high state of efficiency of the regiment at the end of the war. The principal actions under him were: Gruisfontein, on February 5th, 1902, when the whole of Sarral Albert's commando was captured, our casualties being two officers wounded and six men. The next big fight was at Rooival, on April 11th, 1902, when one man was killed and eight wounded. So far as I recollect, 54 Boers were killed, and a great many captured. On this occasion the Scottish Horse recaptured the remainder of the guns taken from Lord

Methuen, after a gallop of over 20 miles. They also were responsible for the capture of the rest of the guns a few days earlier.

Practically all the prisoners captured by Colonel Kekewich's column, with the exception of Wolmaran's commando of about 40 men, were captured solely by the Scottish Horse, the chief credit for the capture of the above commando being due to the King's Own Scottish Borderers, though the Scottish Horse were present.

The second regiment started in Colonel Benson's column in the Eastern Transvaal under Major Murray, Black Watch, and thanks to Colonel Benson's good guidance, speedily became one of the best corps in the country, and never degenerated, even after his death. Their first serious skirmish was at Roodekrantz, on April 30th, 1901, when one man was killed, four officers and one man wounded. Their next at Elands Hoek when three men were killed and nine men wounded. The next fight was the big one at Brakenlaagte, when Colonel Benson and Major Murray were both killed. The men did magnificently trying to save the guns. Only 96 were engaged at this point, and they stuck it

out until only six were left unhit or prisoners. Their casualties were five officers and 28 men killed, four officers and 36 men wounded; total, 73 killed and wounded out of 96 engaged, all the officers engaged being hit. I do not think I have ever heard of better or more determined fighting, and though we lost the guns the camp was saved by the delay, and the men really did cover themselves with glory.

I was sent to reform the column pending Colonel McKenzie's arrival to succeed Colonel Benson. The men felt the want of Colonel Benson's guiding hand much, and the staff work until nearly the end of the war became very bad, and the men had rather an uncomfortable time of it, which led to much grumbling after the way they had been looked after—I may say almost spoilt—by Colonel Benson.

As with Colonel Kekewich, the men during all this time were responsible for nearly all the captures made by this column.

The prisoners taken by the Boers during all this period in both regiments were only six officers and 26 men, all of whom were returned to the column.

Major The Marquis of Tullibardine, M.V.O., D.S.O. 19 Mar. 1903.

SUMMARY giving particulars of Establishment, Numbers, Casualties, &c., of SCOTTISH HORSE.

OFFICERS.

Total establishment allowed with regiment	91	Not including two quartermasters with honorary commissions.
Total number of officers who served with the Corps.	157	-----
Total number of officers serving at end of war	107	This includes 15 officers promoted into Regular Regiments, resuming Regular appointments or invalided.
Total number of officers belonging to Regular Army.	22	These were not all serving at one time with the Scottish Horse, and include surgeons, veterinary officers, riding master.
Total number of officers appointed as Imperial Yeomanry at home.	11	This includes one surgeon and one veterinary officer.
Total number of officers promoted through ranks of Scottish Horse.	46	-----
Total number of officers (Irregulars) from outside sources.	78	This includes one civil surgeon.
Total number of officers whose services were dispensed with.	11	-----

CASUALTIES.

Total number of officers killed	- - - - -	11
" " " died of disease	- - - - -	3
" " " wounded	- - - - -	32
" " " invalided	- - - - -	7

NON-COMMISSIONED OFFICERS AND MEN..

* (A.) Total number of non-commissioned officers and men enlisted in Great Britain as Imperial Yeomanry	- - - - -	1,250
+ (B.) Total number of non-commissioned officers and men enlisted in South Africa	- - - - -	1,458
‡ (C.) Total number of non-commissioned officers and men enlisted in Australia	- - - - -	544
		<u>3,252</u>

N.B.—* (A.) Of these 1,125 were Scots; 97 English; two Welsh; 15 Irish; 11 Colonials. Their average height was about 5 feet 7½ inches. Their average age was about 23 years.

+ (B.) This is about 100 or more below the actual number, but certain books are not available

‡ (C.) This does not include many Australians enlisted under heading (B.)

Major The

Tullibardine,
M.V.O., D.S.O.

19 Mar. 1903.

CASUALTIES

Total number of non-commissioned officers and men killed or died of wounds	60
Total number of non-commissioned officers and men died of disease (including three drowned)	45
Total number of non-commissioned officers and men wounded	173
	278

The regiment was at its strongest in February 1902, when its strength was 1,843 officers, non-commissioned officers and men actually serving in South Africa, and not on the high seas or at home.

COPY of LETTER from the late COLONEL BENSON (commanding No. 3 Column, Eastern Transvaal)
to Lord TULLIBARDINE (commanding SCOTTISH HORSE).

Machadodorp, 7-6-'01.

My Dear Tullibardine,—I must send you a few lines to say how well the Scottish Horse are doing. They have picked up the job very quickly indeed, and now I defy any troops to scout better. Perhaps that may sound to be saying too much, but they certainly are doing remarkably well. Both horses and men are excellent, and their organisation is one to be copied. The system of attached natives under a chief is invaluable when one has to dig out cattle and horses from kloofs perhaps 2,000ft. deep, as we have had repeatedly to do. Your fellows are as keen as ever, and never seem to mind

how long the day is. Often they have been out from 6.30 a.m. till 8 or 9 p.m., all because they *would* make sure of the cattle and wagons they captured. Last trek we only had small parties of Boers to deal with, but they always tried to defend their cattle. We got 29 prisoners and 14 surrenders, 1,700 cattle, 6,000 sheep, 95 wagons, 25 carts, 44 rifles, 300 horses, etc. I would like a turn on the open after some of the big people, but fear it is not to be at present. The new squadron looks first-rate, and Murray is very pleased with it.

(Signed) G. E. BENSON.

REPORT by His Grace the Duke of ATHOLL, K.T., to the Marquis of TULLIBARDINE, D.S.O., *re* raising men in
SCOTLAND for the SCOTTISH HORSE.

About the new year of 1901 Lord Tullibardine applied to the Highland Society of London to endeavour to send out two or three hundred men from home to the Scottish Horse, which regiment he was then raising. A deputation of the society accordingly waited on the War Office authorities, and were informed that the only way it could be managed would be for the men to be raised as Imperial Yeomanry and deducted from the number just authorised by Parliament. The Highland Society immediately advertised for recruits in the Scots newspapers, but as Edinburgh was the only Imperial Yeomanry recruiting station in Scotland, and there was no officer to look after the interests of the Scottish Horse, matters did not progress much. About the middle of February the Duke of Atholl, happening to go to London, communicated with certain members of the Highland Society to ascertain what was being done, and, finding no one knew much, went down himself to Aldershot, where a considerable number of Scottish Horse recruits were known to be, but could learn nothing about them from anyone. The Duke next obtained authority from Lord Raglan to return to Aldershot and see the Officer Commanding Imperial Yeomanry, and to report the result. He found everything in the greatest confusion—thousands of recruits spread over three miles of camp and no adequate staff to cope with the work. A few days later General Mackinnon was sent down to take over the command of the Imperial Yeomanry. The Duke remained in London, and with difficulty got three subalterns appointed to the Scottish Horse, and sent them to Aldershot to hunt up their men, but by this time upwards of 70 had sailed with other corps, and that all managed to join their regiment eventually, with the exception of 14, says a great deal for the men. During March the first two squadrons sailed, but the third was

detained until April owing to an outbreak of scarlet fever. As none of the men who sailed before March were expected to join the regiment, recruiting was continued in order to make good their loss, which accounts for the number taken above the 300 authorised. Early in May Lord Tullibardine asked the Duke to apply to raise two squadrons in Scotland, to take the place of time-expired Australians, enlisted for six months only. The War Office authorities at once gave permission, and were most obliging in meeting the Duke's views. The plan arranged was as follows:—Five recruiting stations were opened to the corps—Inverness, Aberdeen, Perth, Stirling, and Edinburgh—the recruits to be mobilised in Edinburgh Castle, with a Militia captain in command, the Duke overlooking the whole. Every possible assistance was given by the Headquarter Staff and by all the recruiting stations, both then and to the close of the war. The two squadrons sailed before the end of June. In November, to make up for the losses the regiment offered at Moedwill and Brakenlaagte, the Duke again received permission to raise three squadrons, to which on application a fourth was added afterwards. Two sailed before the end of the year, and the last two early in January. On this occasion Glasgow was opened as a recruiting station in addition. At this time all extra recruiting was stopped to permit of the raising of Fincastle's Horse, but as the Duke had a number of applications on hand he received a promise of another squadron when the above corps was completed. Leave to commence was not obtained until the middle of April, when the squadron was completed in nine days, and sailed on May 17th. For the purposes of raising the 10th Squadron Ayr was substituted for Stirling, which had not proved a very successful recruiting depot.

PARTICULARS regarding Men sent out from Home to join the SCOTTISH HORSE in South Africa
in 1901 and 1902.

1901 : January to April	Mobilised at Aldershot	404 men.
	Deduct casualties—	
	Apprehended as an army deserter	1
	Discharged as bad characters	2
	Transferred to Imperial Yeomanry	1
	Left sick at Aldershot	3
		7
	Sailed	397

SCOTTISH HORSE.

Total number raised in Edinburgh - - - - - 831 men.

Nationality—805 Scots, 18 English, 2 Welsh, 5 Irish, 3 Colonials.

Grand total Aldershot and Edinburgh (15 officers, 1,235 men) - - - 1,250 men.

Nationalities—1,125 Scots, 97 English, 2 Welsh, 15 Irish, 11 Colonials.

The Scotsmen were natives of Counties as follows :—

Orkney and Shetland	-	2	Kincardine	-	-	12	Haddington	-	-	18
Caithness	-	9	Forfar	-	-	82	Peebles	-	-	5
Sutherland	-	11	Kinross	-	-	2	Selkirk	-	-	11
Cromarty	-	1	Fife	-	-	36	Dumfries	-	-	13
Ross	-	38	Clackmannan	-	-	10	Berwick	-	-	11
Inverness	-	56	Stirling	-	-	38	Roxburgh	-	-	18
Argyll	-	13	Dumbarton	-	-	9	Bute	-	-	4
Nairn	-	9	Renfrew	-	-	29	Ayr	-	-	25
Moray	-	45	Lanark	-	-	116	Kirkcudbright	-	-	8
Banff	-	24	Linlithgow	-	-	6	Wigton	-	-	2
Aberdeen	-	111	Mid-Lothian	-	-	232	Galloway	-	-	1
Perth	-	118								

The men were of good physique, anxious to learn, and extremely well-behaved.

Roughly I should say each squadron averaged from 5 feet 7 inches to 5 feet 7½ inches in height, and 22 to 23 years average age.

Major The
Marquis of
Tullibardine,
M.V.O., D.S.O.

19 Mar. 1903.

20282. Are there any points in the précis to which you would like to draw our attention, in addition to your statement?—On page 3 of the report, I mention, under special conditions, that I asked that the men from home should be directly under me, and not under the Yeomanry authorities in South Africa, because I was already commanding a large number of Irregulars, and was under the Assistant Adjutant General Colonial forces, and, therefore, it was impossible for me to be under two masters, and Lord Kitchener put them directly under me, so that I am responsible for any good or evil that they did, and if anything went wrong it was my fault, so far as regards their discipline or administration.

20283. But you consider that their discipline was good?—I think they were the best Irregular corps, as far as discipline went, because, of course, they were home men.

20284. (*Viscount Esher.*) Do you think they would have been got upon any condition, except that they should serve under you there? Was that the main condition?—I wired home for them, and, of course, my father's influence helped a great deal, and to the Highlanders it certainly made a great difference, and they were among the best men I had.

20285. (*Chairman.*) Did you get a large proportion of Highlanders?—It is shown exactly in the Duke of Atholl's report where every man came from. I got most men from Edinburgh, but I got a great many from Aberdeen, and they were as good as any men I had; also very good men from Perth, and from Inverness-shire I got some very good ones. Of ones that were very good from the south, there were the Lanarkshire men; the men from Midlothian and Glasgow knew a little too much about strikes and that sort of thing, and they were a little more difficult to manage, but they did very well as far as fighting went.

20286. Do these reports show the class of men—what the men had been?—No, but I can give that if it is required: I can send in the employment of each man before he enlisted.

20287. Only generally?—The outside men were the best men I had; that is to say, outdoor carpenters, plumbers, joiners, blacksmiths, farmers, keepers, and farm hands, if they were intelligent enough; they were harder, and they could stick it out longer.

20288. Did you get a large proportion of them?—Yes, a very large proportion from the country; those men I got from what I may call the "country counties" were particularly good.

20289. The best men were the country men?—Yes, as a class.

20290. (*Sir John Jackson.*) They had better physique, of course?—The Glasgow men won the tug-of-war; there were a great many West Coast Highlanders amongst them. The Aberdeenshire men had the best physique from a general point of view.

20291-2. (*Sir George Taubman-Goldie.*) As regards intelligence, were the Aberdeenshire men good?—Very good.

20293. (*Chairman.*) What is the next point you would like to draw attention to?—I got some very good men from Australia. Lord Kitchener gave me leave to raise them, and I sent a wire to the Highland Societies in Melbourne, and they were instrumental in getting me 300 men.

20294. All Scotchmen?—No, I should think about half Scotch, or of Scotch descent; a good many of them were descendants of people who had emigrated from my part of the world, and they were a particularly good lot, and of very good physique.

20295. (*Sir Frederick Darley.*) From what part of Australia did they come?—From Victoria, the first lot.

20296. And afterwards?—Afterwards they were mostly from West Australia, but they were supposed to be from anywhere later. The reason was that the first time the Australian Government were quite ready to send them out, but afterwards, when the other corps saw that I had got the men in that way, they all tried to get them by all sorts of means from Australia, and the Australian Government had to put its foot down. They found too many men were going out of the country, I think, and so all recruiting, except for Australian contingents, was stopped. Mine were outside the Regular Australian contingents.

20297. You did not get any from Queensland or New South Wales?—I got a few later, but not in any large

quantities. I arranged with Lord Kitchener, and permission was given for men who had already served in the war to come out, and, as I had 300 men waiting, who had nearly all served in the war previously, I got them under that heading the last time, and this, of course, did not make other Irregular corps jealous, or think that I was getting undue favour as they were coming out anyway.

20298. (*Sir George Taubman-Goldie.*) About what was the average age of the men you got?—23, of the men from home.

20299. And from Australia?—I should think, much about the same; some of the Australian men were a good deal older; they ran to all ages, and some were much older men.

20300. Did the older men do the work as well?—As far as concerns the Australians, better; they were a rather hard bitten type of men.

20301. In war, for an Irregular soldier, what age would you recommend—what is the best fighting age?—Of my Scotchmen, the average age was about 23, and no one could have done better, but for scouts the older men were better. The deerstalker's equivalent in Australia would be the old bush hand.

20302. About 30?—Yes, and sometimes much older; we never asked them what their age was, as a rule.

20303. They bore the physical strain of the war all right?—Perfectly; the young ones were the ones who bore it least well.

20304. What ages do you mean?—21 and under. Of the men from home, the average age was 23, and the average height about 5ft. 7½in. The South African men were of very much inferior physique in every way, but it is hardly fair to call them all South Africans, because the best of the South Africans were fighting against us, and these were men out of ships from New Orleans and all sorts of places, and it is not really fair to call them South Africans.

20305. (*Chairman.*) You did not succeed in getting Canadians?—No.

20306. You say that you had an arrangement about them?—Before I got anybody from Australia, I used to write out privately, because it was no use going to Lord Kitchener and saying I could get the men if I was not certain that I could, and I used, practically, to have everything ready in an unofficial manner.

20307. And the Canadians arrived too late?—I could have got the Canadians. I had asked several influential people out there, who were ready to send me men, but the Canadian Government, when I applied for them, said they preferred to send their own contingent, which, of course, was reasonable, and, unfortunately, the delay which occurred resulted in their being rather late for the war but they were not under me.

20308. The contingent you mention in your statement was not a contingent sent to you?—No, it was not; it was purely a Canadian contingent.

20309. (*Sir Frederick Darley.*) Had you any New Zealanders?—Yes, very good men.

20310. (*Chairman.*) I do not quite understand what you say here about the Volunteer Service Company men; the terms, you say, did not work?—That would not refer to any future occasion; but in the Volunteers the company was attached to each regiment, and they were very good men. When these men had served a year, they were entitled to go home, but if I enlisted them I had to enlist them as South Africans, because you could only enlist Yeomanry at home, and, of course, the Yeomanry conditions of enlistment were much better. The Yeomanry were entitled to the voyage home on full pay and an extra £5 grant, but these men were, of course, not entitled to the extra grant or to the voyage pay home. At the time if I could have offered these men Yeomanry terms they would have joined on, which would have been a good thing, as they were the best men from a Mounted Infantry point of view that I saw out there. As it was, afraid of losing their voyage pay, they went home with the intention of enlisting at home in the Imperial Yeomanry, and coming out again, but naturally when they got home many changed their minds, and did not re-enlist.

20311. (*Sir George Taubman-Goldie.*) Good shots?—Yes, very good—the first Volunteer Service Company men. The second Volunteer Service Company were not up to the class of the first ones. Of course, they were picked men at the beginning.

20312. (*Viscount Esher.*) Was that regulation altered ultimately?—No.

20313. Did they get their voyage pay home?—No, they got their free voyage after strong representation, but no pay. They were the only men on the ship who were not paid coming home. It was quite according to Regulations, and they joined under those conditions, which were explained to them.

20314. But there was no relaxation of that condition?—No, not as far as pay is concerned.

20315. (Sir Frederick Darley.) How were the Australians brought there? Had they to pay their own way out?—No, the ones I enlisted in Australia were brought out very much in the same way as the Yeomanry. They were paid from the day they left Australia on a Government transport—that is to say, the ones actually enlisted for the Scottish Horse in Australia—what I might call the genuine draft that came—but any odd men I picked up, of course, were taken as South African Colonials.

20316. My impression is that the New South Wales and Queensland Governments did not favour the enlisting?—No, they did not—in fact, to put it mildly, we had to dodge to get the men.

20317. (Chairman.) What is the next point?—I have described my dépôt convalescent camp—it is in the report. I had a camp of instruction for men from home for riding in Johannesburg, because I asked the Duke of Atholl to send me men who could not ride, as I found in the Highlands you got a better class. I asked for men who could shoot. I could not teach them both, of course, in the time allowed, but I found I could teach them enough riding in the time.

20318. (Sir George Taubman-Goldie.) How long was that?—From three to six weeks. I had a very strict riding master, and they were hustled much more than the men in a Regular regiment would be under the circumstances, but it was to their own interests to learn to ride, first of all as they were very keen to go on trek at that time, and, secondly, as it was not very comfortable in the camp, so that it was to their interest to learn as quickly as they could.

20319. (Chairman.) And they did?—Yes, they learned quite well enough. They would never have done at all to take on civilised cavalry, as they would not have been quick enough; but a very good example of how well they did was at Rooivaal, when the column was suddenly rushed by a considerable number of the Boers—about 2,000, I think—and they went right through them.

20320. (Sir George Taubman-Goldie.) How many of your men were there?—Upwards of 700, and I think there were about 2,000 Boers on that occasion. It was the whole lot of the Boers in the Western Transvaal, and my men did not realise what they were until they heard from the next column, which happened to have come up that day under Colonel von Donop. Grenfell, who was in charge of the column in which my men were, did not know anything about it, but Colonel Leader was in front, and had just time to tell the men to fall off their horses, and they with the South African Constabulary, who were with them—about 80 of them—let go their horses, and simply lay down, and as the majority of my men were new men it was a very critical performance. They killed 54 Boers, and I think we captured about 200 and got Lord Methuen's guns back. The Boers were within 30 yards of them before they knew they were Boers really. They were within 30 yards of the South African Constabulary and within 75 yards of mine. It was their first fight, and they did extremely well, which shows the value of getting a good class of men, who do not get excited. I think if I had had Australians on that occasion they might have got too excited; but a Scotsman will do exactly as he is told.

20321. (Chairman.) The object was to dismount?—Yes, to dismount and keep quiet, and let them have it when it was necessary.

20322. (Sir George Taubman-Goldie.) A good deal depends on the officers. Who were your officers?—I have described it fully in my report; but the officers were of three classes—the Regular officers, the officers promoted through the ranks, and the officers appointed at home as Imperial Yeomanry.

20323. How many of them had seen service before?—They were new troops, but I put them under the command of my best men.

20324. (Chairman.) What is your next point?—The

next thing I have got down is transport, and I advocate—in South Africa, at all events—having professional transport officers, as they were much better than any British officer could possibly be.

20325. What do you mean by professional transport officers?—The best class of men are what are called transport riders. They are men accustomed to wagons, and I think the officer should be an Irregular if you could get a good one you could trust. The one I had had been accustomed to driving wagons all his life. There are lots of gentlemen out there who have left this country, and spend their time in charge of big convoys, and these men would be invaluable on service in charge of the wagons. I do not mean in charge of the organisation or money, but simply in charge going along the road.

20326. (Sir George Taubman-Goldie.) For trekking?—Yes; in fact, a superior kind of conductor.

20327. (Chairman.) If you had Regulars whom would you have? Would you have an officer from the Regular Army to do that sort of work?—Yes; he is absolutely in charge, and you must have an officer there to take charge of the transport, otherwise you do not know quite what they would be up to, and all sorts of abuses would creep in. The men would get into the wagons, and the things would get overloaded.

20328. Do you speak of these Irregulars, the professional men, as officers?—As officers. I am talking of the men in charge of what I might call the wagons and horses and the loading, and so on.

20329. But I understood you to say that anyhow you would have an officer of the Regular Army in charge of the money, and all the rest of it?—I mean that the Army Service Corps officers ought to be Regulars, but in every regiment, in addition to the ordinary column transport, there is a certain amount of transport attached, and one of the officers of the regiment who has previously had no experience of any sort is always told to look after the wheeled transport. He is usually the junior subaltern or a subaltern who is a bad troop leader, and he is told he has to look after the transport. One of these professional men is very much better, and they keep the transport going.

20330. It is in substitution of that officer, and not of the Army Service Corps officer?—That is so. We had civilian conductors out there, and they were necessary, because of their knowledge of the language; but they were a great nuisance, and you could not trust them. A very good sergeant is the chief thing you want.

Pay is the next thing. I have given you the rates of pay, and they were the usual rates for the different classes of men. I had three classes of men, which sometimes created a little grumbling, but that was unavoidable.

20331. You had paymasters?—Yes, and I advocate that very strongly on service. A combatant officer has not time to look after his pay and to see that the men are paid or looked after, and I found that the plan was to have an officer as I describe in my report: "Considering that it was unfair both to myself, to the untrained officers concerned, and to the men, that squadron officers should be responsible for the payment of the men on active service, I had one paymaster for each regiment who was entirely responsible for the accounts and payment of the men, and every detail with regard to pay, with the exception of allotments, which were in the hands of the Imperial paymaster. These men, though officers of the regiment and under me, were under the control of the Imperial paymaster, who was supposed to go through their accounts every month, so there should have been little field for peculation or error if properly audited. At the headquarters of the regiment a book of headquarters orders was kept, quite apart from the different regimental order books in the field, and all promotions, etc., were entered in this book before any change of pay could be authorised, both paymasters having access to this book daily. I may state that it is almost impossible for regiments in the field to know when non-commissioned officers are invalided, etc., but that I, having better access to the correspondence, hospital returns etc., was able to fill up the vacancies more quickly, and to prevent over-promotion that the officers commanding the regiments in the field." (It is impossible, and when a regiment was split practically into three I had to go and sit in Johannesburg and work it as a headquarters.) "The regimental paymasters visited

their regiment each month, and paid the men so much of their balance as they required, placing the rest to their credit—the result being that the average of pay due to the 700 men I brought home was between £30 and £40, some of them having as much as £150. In addition to this, knowing what balances officers and men had, the paymasters were able to authorise certain expenditure on officers' and men's accounts if they wrote in for anything, such as mess stores or clothes, or if they wanted to send money home extra to the regular remittance or allotment. No Imperial Paymaster would have had time to do this, and no squadron officer in the field could possibly have done it. In Irregular corps it would be impossible to trust every squadron leader with the money, partly because of ignorance of their previous character"—(it would be perfectly impossible with most of them)—"and partly because they were not sufficiently well educated. Also, I wished the whole of their energies devoted to their squadrons and to fighting the enemy." (I may here state that there are so many forms to fill up that very few Regular officers are able to work out a pay-sheet right without its being sent back.) "Each paymaster had a staff of one non-commissioned officer of the rank of Quartermaster-sergeant, one sergeant, and one corporal." . . . "I consider it absolutely necessary if the above system is continued in future that the senior non-commissioned officer should be a trained Army pay-sergeant. This would cause considerably less trouble to the Imperial paymasters concerned. I may state here that the only department that ever caused me trouble and did not assist was one of the departments of the Army Pay Department. By this I do not in any way reflect on the Chief Paymaster, who did his very utmost to help me at all times, but the actual department which Irregular corps had to deal with. Instead of being assisted the regimental paymasters were, as a rule, very discourteously treated, and were never really told exactly what system to follow. The result was that many mistakes occurred which might have been avoided. No proper regulations were framed when the regiment was first started, and, having no Army non-commissioned officers at that period, the books were apt to get muddled from an Army point of view, and I had far too much to do to be really able to check them. The regimental paymasters also would come back from Pretoria very much ruffled in their tempers, and, in consequence, did not play up so well as they might have, had they been more led than driven. This complaint was not peculiar to my corps." These men were Australians, who are an independent sort of men, and if they had been rather led I do not think there would have been any difficulty with them, and I think it rather important in a pay department dealing with Irregulars to have somebody they like, because if they like a man they will do anything for him.

20332. These regimental paymasters were extra to the ordinary staff?—Yes, they were two officers appointed. I tried to get good business men, and, not knowing the Army Forms, it was almost impossible not to get behind-hand at first, because they did not know exactly what was wanted, and I considered that we should have been supplied with a good Army clerk; such a man would have saved, I am quite certain, thousands of pounds to the Government in the way of over-payments to men, and so on, in Irregular corps. For instance, very often when a new paymaster paid the men, a man with stripes on his arm walked in and said that he was a sergeant, as he probably was, and he got paid, but afterwards it was found that he was in excess of the establishment, and that he should not have been paid. An Army pay-clerk would have stopped that.

20333. (Sir John Jackson.) I suppose the regimental officer more or less considers it a little *infra dignitatem* to be bothering about accounts?—No, I think it is pure ignorance on his part. And if you come in very tired in the evening after having been out all day, and you are going out for a night march, and you have a month's accounts to make up it is very trying. A month's accounts will take a good man a good long time to make out, especially when you have to deduct all the allotments and remittances, and so on, and especially in an Irregular corps. It is very difficult work, and you are always changing squadron leaders on service, as they are getting killed, die, etc., and the next senior and subaltern of the corps does not know the men in the least; he does not know the men in the hospital, and they never get paid at all, and so on, and there are men invalided home who are lost sight of.

20334. (Sir George Taubman-Goldie.) Had you clothing accounts, too?—No, none. I was not very anxious for any outside accounts. One regiment in Natal provided themselves with a great many things; they were given leave to do so, and it was the most expensive pay account I saw. I remember when it was being passed by Lord Kitchener.

20335. And you had no complications beyond the actual pay and allotments?—That is so. The allotments from home were rather complicated, because the Yeomanry authorities never sent me any, and the allotment sheets in the case of one squadron arrived a year and five months late.

20336. (Sir John Hopkins.) How did you provide necessities—for instance, if a man wore his boots out?—I had a depot at Johannesburg, and they drew nothing in the column at all, but before the column came in they used to wire to me what they required, and I used to draw it and to have it waiting for them when they came in. I have described that very fully, but it would not work against anyone but the Boer.

20337. (Sir George Taubman-Goldie.) Why not?—Because I think they would have captured my little advance depôts. No civilised foe would have allowed them to remain.

20338. I suppose the Boers captured all they could?—They got quite enough, but they had no organisation; and we fought them in that way in the same way as we would fight a savage. I am talking of the end of the war. I also made arrangements on board ship at the end of the war to try to check the waste of money on drink among the men, and that is thus referred to in my report. "On going on board ship for the voyage home I found that the men had so much pay due to them that it would have been very injudicious to have given them all the money, first as there was a large amount of illicit drink on board; secondly, as about a hundred Reservists on board had formed 'a silver ring,' I having only gold for my men. These Reservists had each been paid, in some cases about £20, and what they did not spend on drink they spent on gambling, and if any of my men wanted change for canteen, etc., they were forced to take 15s. for a sovereign. To check this I issued bank notes to the value of 2s., 1s., and 6d. My men were paid in those notes only. They were made the only legal tender at the canteen, and the only legal tender for beer, and I gave full value to my men in exchange for money. This very soon stopped all abuses on board. These notes were redeemed the day before landing, and were illegal tender for any of the ship's crew, and could not be redeemed by them. The result was that the crew were unable to sell drink, as it was too risky to give the men credit. There was no redress if a man lost the notes, and any surplus gained through lost notes by the regiment was placed to Widows' and Orphans' Fund. I am of opinion that a great deal of good could be done by issuing notes to men on transports the day before leaving in lieu of pay—these notes to be redeemed at their depôt on date of arrival only, after which the notes should be immediately destroyed, so that they could be of no use afterwards to anyone who should have stolen any of them, or to the crew on board ship on subsequent voyages." I thought that helped the men a lot to save their pay.

20339. (Chairman.) As to horses?—I drew from the remounts. My system was to have an advanced horse depôt established up the line somewhere near where the regiment was working, and I drew remounts from the Army remounts and sent them up to this depôt, and when the regiment came to the line they drew horses from this depôt and left their sick horses there. The Army supplied me with horses, and only casualties were sent to the Army sick depôts. I only handed in to my own depôts horses that would take about ten days to get better, so that I had always a supply of fairly good horses when the regiment came in.

20340. (Sir George Taubman-Goldie.) Where was your principal depôt?—My principal depôt was Krugersdorp, and it used to work to Klerksdorp; my other one was up at Middleburg and I shifted it later to Standerton according to where the column was.

20341. (Chairman.) You were always able to keep horses until they were properly acclimatised?—That is what it practically came to. A good example of this was at the beginning when I was given the Russian horses;

Major The
Marquis of
Tullibardine,
M.V.O., D.S.O.
19 Mar. 1903.

they had to send them out at once because we were hard up for horses, and they went sick and died and were very badly reported upon, and Lord Downe saw them and did not like them at all. Later, he went to Australia and I had another lot of Russians, ponies this time, and I was able to keep them in my dépôt for nearly a month, and they were the best ponies for mounted infantry I ever had.

20342. (*Sir George Taubman-Goldie.*) Had you exercising grounds at your dépôt?—Yes.

20343. (*Sir Frederick Darley.*) Where did these Russian ponies come from?—The Caucasus, I believe.

20344. Where were they shipped?—From Odessa, but they had only just landed when I got them, and they had tremendously long coats, rather like Highland ponies. They are not suitable for cavalry, but they are typical mounted infantry ponies.

20345. (*Chairman.*) And by keeping them a month they got into sufficiently good condition?—Yes. Of course they might have been better, but they were better than most of the animals we were able to get owing to the pressure.

20346. And you think your regiment got through the war with less wastage of horses than an average regiment?—I think in proportion to the work it did. You must remember that we were with Colonel Kekewich and Colonel Benson, and later, with Colonel Bruce-Hamilton, and they had practically the whole of the fighting and trekking in that part of the world to do, and it would not be fair to compare it with a regiment that was working off the line. Of course, we had very heavy casualties from the enemy, so that it is impossible to compare regiments.

20347. But the great wastage of horses arose from their being used before they were in condition?—That was the real reason.

20348. And you think your dépôts prevented that a great deal?—To a great extent, but dépôts are impossible for Irregular corps, as a rule, unless commanded by Regular officers. One or two corps who tried it found that they were dépôts for a great many things besides, and that it led to a great deal of peculation in every way, and especially if near Johannesburg the horses were apt to stray, and sometimes the grain disappeared, whereas, if you had a Regular officer over them such abuses were much more likely to be stopped.

20349. Of course, they would require regulation, but granted that, the dépôt made all the difference in the lasting qualities of the horses?—Yes. Of course I was only doing what the remounts in a way ought to have done, but being my own regimental horses we took a very deep interest in them and had more hands to them. I used to turn my convalescents on to look after the horses when they had nothing else to do, and it was also a good thing, because the convalescents had not to wait on the line as long as they otherwise would have had to do.

With regard to the officers, my Regular officers did extremely well, and it is everything in an Irregular corps to have a good supply of them. It is perfectly impossible to expect a regiment to run without a Regular Adjutant, and it is not fair on the regiment or on the men. I never heard of a good Irregular corps out there that really did well that had not got Regular officers commanding it, and everything was checked, such as these extravagances in clothing and horses, and abuses were much less likely to occur. The men were also very much more comfortable. At first the Colonials did not want to have Regular officers at all in the Scottish Horse, but they very soon got to like them better than any other; they preferred them as there was a difference in their comfort in every way.

20350. You would like to have all the senior officers Regular officers?—I should like to have the commanding officer, the second in command, and the Adjutant, Regular officers.

20351. Not the squadron commanders?—Of course, one would like to have them, but one cannot, as there are not enough, and you must leave a certain amount of promotion for the Irregulars. There are certain fine men among the Irregulars who make fine leaders, but who have no ambition to command a column, but the moment they began seeing other men commanding columns, naturally, they thought they should, too. Even in some of the biggest Irregular corps, which were nominally commanded by Irregular officers, they were

really commanded by Regulars; in fact, very often the Irregular officer got promoted so high, that it was almost impossible for him to take the field with the small bodies that went out. I think that it ought to be a *sine qua non* that every Irregular squadron ought to have a Regular sergeant with it; it makes the whole difference, and a good example was the 5th Victorians when they landed; they landed in the same ship as my Victorians—the “Orient”—in Cape Town, and they had practically no one of previous experience among their officers, and no Regular non-commissioned officers, except a sergeant-major, who was a good man. They landed equipped, and my men landed without any clothing at all, but I was able to get my men ready for the field before their men were ready, because there was no one with any knowledge with them, and their men got out of hand. The officers were ready to do what they could, but they did not know what to do, and there was no Regular officer to help them in any way. I reported, not officially, but I mentioned that I thought they would come to grief if they had not a Regular Commanding Officer to look after them. They were magnificent men, just as good as my men, and some of them were brothers of some of my men, and a great many wanted to transfer to me but that was not, of course, entertained for a moment by me. When they went into the field they rather came to grief, and it was chiefly owing to bad discipline; but they were identical with the men I had under Colonel Benson, and I do not think anybody did better than my Australians in that corps.

20352. (*Sir George Taubman-Goldie.*) One Regular non-commissioned officer per squadron would do?—Yes, and he must be sober.

20353. And an experienced man?—Yes. I would have a Regular sergeant-major, too.

20354. Would he get on with the men?—They are very popular, and I do not find that the Regular sergeant-major is unpopular. The remark of one of my Victorians made to me was, “We did not like to have these men coming in and bossing us up, and we thought we knew everything ourselves, but this man knows all about it.” He had had experience, and knew exactly what the men wanted, and I never had an unpopular Regular non-commissioned officer except one, and that was his own fault.

20355. (*Chairman.*) You think that the commander of an Irregular corps must have the power of dismissal?—Yes, it is absolutely necessary, and if he tells a man he has to go he must be backed up. I have had officers in Irregulars, whom it was necessary to tell, “I cannot keep you in the regiment,” and Lord Kitchener always backed me up.

20356-7. You mean with regard to officers and men?—Yes. With regard to officers I exercised the power eleven times. With regard to the officers, you should have a very free hand, and with regard to the men you ought to be able to do it then and there on the spot; it is far the best punishment to turn them out of the corps.

20358. There is a difficulty about punishments in the field?—I found none. I had very little to do, and what I did, as a rule was to make the man walk beside the column and take his horse away. The field imprisonment is very degrading. I saw a man at the time of the Spion Kop affair who was given field imprisonment, and tied to a wagon, and he fainted before he got there. He was a very fine man and an old soldier, but it was the only imprisonment that could be given him, and I made up my mind never to give it to a man again; I did not give it to him personally on that occasion, but I saw it given, and I know that the officer who gave it to him never gave it again, and it is especially bad to tie a white man up before niggers.

20359. (*Sir George Taubman-Goldie.*) We have been told that a man dismissed in that way could enlist in another corps?—Yes, that was the great difficulty, and I have mentioned that. At the coast at the beginning, all you had to do was to enlist a man and take him away to the front, and this got so abused by some corps, as they took what were known as wasters, that a Central Recruiting Office was formed with a Regular officer in charge, and every man had to go through him before he was sent to the front. A register was kept, and every man who was discharged had to be reported to him.

20360. (*Sir John Hopkins.*) In exercising the power of dismissal, did you have a court of inquiry, or was

Major The
Marquis of
Tullibardine,
M.V.O., D.S.O.

19 Mar. 1903.

it a drum-head court-martial?—Dismissal was only exercised in the case of an absolute waster; sometimes he was quite a nice man, and you would tell him quietly it was no good his staying; at other times they were men who were always getting into trouble, and giving the corps a bad name, or whose nerve was not right, and so on, and you were supposed to report each man to the Assistant Adjutant General Colonial Forces; but at one time I had a lot of bad men I had been obliged to take, because Lord Kitchener wanted men in a hurry, and a good many of those men I had to send away.

20361. And the power of dismissal you kept absolutely in your own hands?—Yes; I was supposed to report them to the Assistant Adjutant General Colonial Forces, but, as a matter of fact, he trusted me, and I reported to him at the end of the month.

20362. You really dismissed on account of reports you got?—The Commanding Officer used to send them in to me with proper evidence; evidence was taken, and the men who were turned out were usually men who wanted to go.

The officers appointed at home were of a less affluent class than those from which they are usually drawn. The men promoted through the ranks were simply men promoted on merit, and they did extremely well. We found that gentlemen were the best men, and, by a gentleman, I do not mean a man with a lot of cash, but a well-bred man, because you could always trust him, and if you put him in charge of a post, he would stay at that post, and he keeps his head better in action, as he does not get excited, as a rule. He is rather wider-minded in every way, the men liked him better, and you could get him to understand, which you very often could not get men of a lower class to understand, that when he came home to camp after a hard day, his day was only beginning, and he had to look after the men. I had 157 officers altogether with the regiment, and I had 11 who had to resign.

20363. (Chairman.) As to shooting, scouting, horsemanship, and horsemastership, I suppose you have stated them all in your paper?—Yes. The Australians were far and away the best horsemen in every way.

20364. And in horsemastership, too?—They would have been better if they had been less good horsemen; that is to say, a Scotsman is not very anxious to gallop if it is unnecessary, and his horses did not get used up so much, but the Australian always prefers to go at a gallop, and, if a horse is doing very hard work, it cannot stand it.

20365. (Sir Frederick Darley.) When he has ridden down one horse, he jumps on another?—Yes, that is what he is accustomed to doing in his own country.

I have marked "Thieving in Hospitals," and it is explained exactly in my paper what that is. When men went into hospital, I never got their kit (except in a very few cases) if they died, and it caused a lot of trouble. You cannot blame the hospitals, because they had men sent by the regiments as orderlies.

20366. (Chairman.) You now pass on to the suggestions for the future?—Yes.

20367. Is the Scottish Horse being continued?—Yes; we are to raise two battalions of them at home as a Yeomanry.

20368. (Sir Frederick Darley.) Where are they now?—At home; I have got about 400 of them.

20369. (Sir John Jackson.) Are they all from one particular county?—No; Lord Lovat has one half, and I have got the other, from all the northern counties.

I have already touched on most of the things in my report pretty fully. I made a point rather about farriers; the present Army organisation is that there are so many attached to each squadron, and if they all go sick in one squadron there are no farriers, and there is grumbling, and I think they ought to be regimental, the same as the signallers, and I have touched upon that. As to the equipment, I have stated what was good and what was bad. The clothing was excellent all through. The web bandoliers sent out to us were perfectly useless, because if they got wet they stretched, and they dropped all the ammunition; you cannot get them to keep their size, as they either shrink or get loose.

20370. (Chairman.) I see you consider bayonets essential?—For mounted infantry regiments in attack; for instance, whether you are going for them or they are going for you, they are very useful.

20371. Do you mean a bayonet used on foot?—Yes, I saw them used, or tried to be used on horseback, and I thought it was silly; you cannot use a bayonet or a rifle on horseback.

20372. And you have no use for an arm for the mounted infantry besides the rifle?—Not for mounted infantry; but the Australians are such fine horsemen, and it is almost a pity that practically the only, what I might call, Cavalry Reserve we have got—because you cannot really call the Yeomanry a Cavalry Reserve—should not have swords as well as their rifles, because although you could never expect them to drill and manoeuvre against European cavalry in some ways, yet they are so quick that occasions might arise when they can get a charge. I had lots of charges when the men had no weapons, and we could do nothing, and if we had had a sword it would have been very useful. I armed my 50 best Australians, by Colonel Benson's advice, with short lances. We cut off 2ft. from the butt ends of the lances, and then put the shoe on again, and used them as pig spears. We used them often, but we never used them into people, because the Boers put up their hands the moment they saw them. They were a weapon that any inexperienced men could use.

20373. (Sir George Taubman-Goldie.) What would the length be altogether?—I could not tell you, but it was 2ft. off the present lance. I should think they would be about 7ft. long.

20374. (Chairman.) It has been suggested that a bayonet could be devised which could be used on a rifle as a short spear?—A rifle is much too heavy, I think. With a small carbine it might be possible.

20375. You would prefer a lance to a sword?—No, I do not say that; if you have a rifle as well, of course, the lance is more deadly. Before going up the Atbara, Colonel Broadwood went to Lord Kitchener and said that we wanted water bottles and new swords for the Egyptian cavalry. The swords we had were of foreign manufacture. They may have been made in Cairo for all I know, but they bent up. Lord Kitchener said he could not have both, but he could have which he liked, so he chose the water bottles. We took the old swords up the Atbara, and we had a very severe fight just before the battle of the Atbara, and I saw men using the swords, and they did absolutely no damage; they nearly always hit with the flat. I never saw the men do any harm with the swords at all, while the lances did do damage. It is impossible, however, for a man to carry the three arms at the same time, and the sword in the hands of an expert European should be deadly enough.

20376. A proposal which has been made to us is to have a sword for a thrust—a much lighter sword than the present one—to be used for a thrusting sword rather than a lance?—The present sword, especially the one we have got in the Household Cavalry, no one could possibly use without falling off, if he really cut with it.

20377. I think everybody agrees that the present regulation sword must be altered?—Yes, you want quite a light sword, and pretty strong at the forte.

20378. The question I meant to put was whether you preferred the lance to a sword of that description?—I should prefer the sword. I think that actually the lance is the more deadly weapon, but as you have got to carry a rifle, the sword is the only other weapon you could carry.

20379. But the only person who could carry the sword is either a cavalry man or a man who is fit to be turned into a cavalry soldier?—Yes, and the lance gets very much in the way when scouting, as you will see it for miles. Taking things all round, I think the sword would be better than the lance.

20380. (Sir Frederick Darley.) Would you have the sword attached to the saddle?—Certainly.

20381. Not round the waist?—No. I saw a very good attachment for a rifle, and I have mentioned it in my statement, which Colonel Paterson, of the Imperial Yeomanry, had. It is the nearest approach to a sound thing I have seen. If you can carry your rifle on the body it is much the best plan, because if you fall off or if the horse gets away from you you have your rifle, and the one I have just mentioned was the best attachment I saw. The Natal Carabineers had one, but it was a bad attachment, because it always caught your elbow. It was all right for a carbine, but not for a big rifle, and the muzzle of the long rifle is apt to go into the ground. The best type of saddle all round was the cavalry saddle, but it was too heavy. The Colonial saddle was not a

good one, and used to give sore backs. The blanket system is much the best.

20382. (*Chairman.*) We had some evidence to-day that the Colonial saddle was the one which gave fewer sore backs?—Well, I have not got any statistics, but I was in charge of a troop of the Royals personally at the beginning, and we used cavalry saddles, and they did well, but they were too heavy. Colonel Leader, who was a particularly fine officer of the Carabineers, and who is now commanding the Volunteers in Natal, begged me to get nothing but cavalry saddles, and I had all my Colonial saddles changed so far as I could for cavalry saddles. Colonel Duff also asked for them. I personally preferred them, and the men among the Australians always asked for them when they had been out a short time.

20383. (*Sir George Taubman-Goldie.*) The cavalry saddle is heavier?—Yes, but you can alter it to suit the horse's back, and it could be very much lightened by cutting off a great deal of the unnecessary parts—for instance, those burrs in front ought to come off, and the naps on the saddle should come off, and there should be a small leather guard on the stirrup leathers—simply a sort of slide—as they have in some parts of America, and instead of being made of wood it could be made of steel.

20384. (*Sir Frederick Darley.*) When you speak of the Colonial saddle you mean the South African?—I meant the pattern known as the Colonial saddle, or the South African. They varied in weight.

20385. Have you seen the Australian stockman's saddle?—Yes, I know them well, and they are good saddles. The Allan pattern saddle was the best saddle I saw out there. That is Allan of India, the man who supplies the Indian Government. But it was capable of being lightened a good deal, and he was working to present ideas. The wallets we never used, and they were always thrown away or returned. Very much lighter ones might be used. The great coat has also caused sore back when it was folded across the withers, and it was much better used as the Boers did, across the back of the saddle, flapping open, with one strap round the centre. We never used corn bags; we never carried any extra supply of corn at all. In the Egyptian cavalry we used to carry a small corn bag. If that was carried across the smaller wallets, the further the horse went the lighter it would get, and we might have gone without transport for two days more than we could do otherwise.

20386. (*Chairman.*) You want two Maxim guns instead of one?—Yes, because the one could support the other. I worked the Maxim out there at the beginning of the war, and you very often cannot get away if you have only one. It is just when you are limbering up that you are caught. If you have another working in support you are all right, but if you are limbering up by yourself they are in on you very often.

20387. (*Lord Stratheona and Mount Royal.*) Some of the Colonial regiments had three Maxims?—Yes. Lord Dundonald wanted me to take charge of his Maxims; he wanted to work them as a sort of division. He wanted to have about 12 Maxims altogether, and the Boers, I think, saw much better than most people that these kind of guns ought to be separated and used to support each other.

20388. I spoke of the over-sea Colonials?—Of course, we got as many as we could get. They are a very useful adjunct to your force. I had two with one regiment and one with the other. The Colt gun did good work, what I saw of it, and there ought to be a tripod mounting, I think, always beside it. I have described that in my paper.

20389. (*Chairman.*) The pom-poms you thought too expensive?—They are good guns, but it is too good a gun to entrust to an untrained cavalry officer. That is what I mean by that, and I do not think it ought to be attached to a cavalry regiment, because sometimes you are going too fast, and you would have to leave it behind. It ought to be attached as required, I think, in the same way as guns are.

20390. (*Sir George Taubman-Goldie.*) Did you find you could carry your Maxims without hindering you at all?—Yes, perfectly. We could take them anywhere—not if you had an infantry carriage, but with the cavalry carriage. The best plan is to have a cavalry carriage and a tripod mounting carried on a separate horse—not on the carriage.

20391. And you had that?—Yes; and if there is shell fire you simply change the gun on to the other horse, and they will shell the carriage while you can get along with the gun in another direction. As to water carts, I said I thought there might be some arrangement for lighting a fire under them. I am sure that would help to prevent enteric, and if there was an oil-stove, or something of that sort, you could have hot water at the end of your march. As to transport, I advocate more transport and lighter. By "more" I mean instead of having two heavy wagons it is better to have four light ones of the four-wheeled trolley type.

20392. (*Chairman.*) That is the transport to carry the kits and that sort of thing?—Yes, to carry anything, in fact.

20393. Not the supplies?—Well, to carry your supplies with the regiment, that is your first line of transport.

20394. Not the second?—No.

20395. (*Sir John Jackson.*) Do you think oil motor cars would be useful for transport?—No; they would be for the main columns possibly, but if they stuck anywhere you would have nothing to haul them out with. Going over rough ground they would be very difficult; going over roads, of course, they would be perfect. For what you call bringing up supplies they would be perfect; but not actually in the field. As to tents, the men always liked bivouacs better, and they show up much less. As to rations, the only thing the men did not like was a "Maconochie," it was too heavy when their digestion got weakened.

20396. The biscuits were hard sometimes?—Yes. The chief trouble I had with the men was through their teeth, because their physique was always good as a rule if they passed the doctor, the men from home, anyway; but their teeth used to go, then their digestions went, and they generally got dyspeptic, and you could not do anything with them.

20397. (*Lord Stratheona and Mount-Royal.*) Had your men filters?—Yes, we had filters; but, really, if you are going hard they get damaged, and you can never count on using filters, or a man may use them for a week, and then one day he does not use them, and very often if a filter is not carefully looked after it is very apt to get foul and to carry disease.

20398. (*Chairman.*) The regimental paymasters you have already spoken to?—Yes. Before I left South Africa I raised 700 men for the Scottish Horse out there as a permanent force, and they were to be increased to 500, and I also started an infantry battalion to be raised to the number of 800, and they have recruited very well, and they are working really in conjunction with my regiment at home. If we could get another lot in Australia, if the Colonial Governments would agree, I believe we would have a very good nucleus for a future war. The men from home and from Australia came out so well that if you had them organised before a war I think you could get from 3,000 to 4,000 Scotsmen who would be very useful; they would come out from every country from *esprit de corps*.

20399. (*Sir Frederick Darley.*) You tried them from Australia?—Yes, and it was very successful during the war.

20400. But since?—It is a matter for the Government; I have put it here as a suggestion.

20401. Have you been in communication with the Federal Government?—No. It might be worth trying and might be taken up on account of that *esprit de corps*, and I have described it fully.

20402. Do you know General Hutton?—Yes.

20403. He is there now?—Yes.

20404. I dare say he would be able to give you information?—Yes, I thought of writing him, but I was not quite sure that it was my business.

I have put down a summary of the services of the regiment; we were under Colonel Kekewich and Colonel Benson, and that is what made the difference between a good and a bad regiment—they were really good regimental commanders. I have appended to my statement a letter of Colonel Benson's.

20405. (*Viscount Esher.*) Who was the first commanding officer under whom you served?—General Burn Murdoch. I was with him at Colenso and going into Ladysmith; I was his staff officer there.

20406. When you went out to South Africa you were

Vide
page 456.

Majr The Marquis of Tullibardine, M.V.O., D.S.O. a subaltern in the Household Cavalry?—Yes. I was really a captain, but it had not been gazetted.

19 Mar. 1903. 20407. When did you get your lieutenant-colonel's rank?—Not until quite late in the war, in August, 1901.

20408. When you came back again you went back to your ordinary duty?—Yes, I did go back. Now I am going to be seconded for yeomanry.

20409. (*Chairman.*) Have we gone through everything?—I think so, roughly. I have given full statistics of where the men came from in the Duke of Atholl's statement, and I have given a summary in the last page of my own of casualties, and so forth. The best thing the Scotsmen did out there was when Colonel Benson was killed; they had 96 men engaged, and they had 77 hit, which is very good indeed for irregular troops, I consider. Our commanding officer, Major Murray, was killed, and the adjutant, Captain Lindsay, and they had 77 other casualties.

20410. (*Sir John Jackson.*) Where were those men from?—Scotland, nearly all of them; there were a few Australians.

20411. (*Lord Strathcona and Mount Royal.*) Out of 1,125 men you had from Scotland there were not more than a couple of dozen from the West?—No, very few from Argyleshire. I do not know that part of the country, and they do not know me very well, but I am going to recruit there in future.

20412. You have mentioned that you tried to get some Canadians, and that they were ready to go, but that the Dominion Government objected?—Yes.

20413. What was the cause?—Lord Kitchener asked me to get 400 Canadians, and this was just before the question of sending out a Canadian contingent arose, and they said that as it had been settled they were to send 600 they would far rather send 1,000 altogether, which was, of course, quite reasonable.

20414. And that they should go out as a Canadian contingent?—Yes, and not as Scotsmen.

20415. But, as a matter of fact, you had some Canadians?—Very few. Those I had were all good men.

FIFTIETH DAY.

Tuesday, 24th March, 1903.

PRESENT :

The Right Hon. the Earl of ELGIN AND KINCARDINE, K.G., G.C.S.I., G.C.I.E. (*Chairman.*)

The Right Hon. The Viscount ESHER, K.C.B., K.C.V.O.

The Right Hon. The Lord STRATHCONA AND MOUNT-ROYAL, G.C.M.G.

The Right Hon. Sir GEORGE DASHWOOD TAUBMAN-GOLDIE, K.C.M.G.

The Hon. Sir FREDERICK MATTHEW DARLEY, G.C.M.G.

Admiral Sir JOHN OMMANNEY HOPKINS, G.C.B.

Sir JOHN EDGE.

Sir JOHN JACKSON.

BERNARD H. HOLLAND, Esq., *Secretary.*

Mr. L. S. AMERY, called and examined.

Mr. L. S. Amery. 20416. (*Chairman.*) I believe you went out as a representative of the "Times" to South Africa in August, 1899?—Yes.

24 Mar. 1903. 20417. That is to say before the outbreak of the war?—Yes, I went out really to study the political situation.

20418. And you went up to Pretoria at that time?—Yes, about the third week in September.

20419. Just before the outbreak of the war you were in the Boer laager?—Yes.

20420. Did you form any opinion then as to the position of the Boers?—In what sense?

20421. Either as to numbers or supplies, and so on?—Yes, I took a good deal of trouble at the time to try and get from the Boers what their numbers were, and since then in connection with my work on the "Times" History of the War. The Boers in the Sandspruit Laager, where I was, and immediately round there were about 8,000, and, as far as I could make out, the total number of Boers who invaded Natal, including Free Staters, at the beginning of the war was about 17,000 to 18,000, and another 2,000 or 3,000 came on in the next few weeks. I think the total Boer force that crossed the frontier at the beginning of the war was at least 37,000.

20422. That crossed the Natal frontier?—No, all the frontiers—about 37,000, and possibly over 40,000.

20423. (*Sir George Taubman-Goldie.*) Where do you get the difference between the 17,000 and the 37,000?—The force that was with Cronje on the Mafeking side was large, and then there was a force at Kimberley, and there were the Free State forces along the Cape Colony border.

20424. Would you put those three forces at 20,000 as an aggregate?—I think so. There were certain commandos watching the Rhodesian, Basuto, and Swazi borders.

20425. (*Chairman.*) Was that from information you got while you were with the Boers?—Yes, and in Pretoria, just before I went down to their laager.

20426. And in the Sandspruit Laager did they seem to have supplies and equipment?—No. The most of the Boers got down there between September 29th and about October 4th or 5th. I came down on the 5th, I think, and things were still in very great confusion, and some of the commandos had nearly starved. The Boers in making up their mobilisation had only thought of mobilising the men and sending them down by train, and they had made no proper provision for stores. All the Netherlands Railway trains had to run down in a great hurry to the frontier with burghers and horses, and there was a great lack of supplies. Some of the commandos had bully beef and nothing else—no forage and no tents. I think Joubert's War Office, such as it was, had allowed for every burgher bringing his own things, and the burghers had relied on Joubert. It was very raw, cold weather, and rain, too, and many of the commandos were very short of blankets. Some were without mackintoshes, and, in fact, there was great confusion all round. I think it was that confusion that prevented their crossing the border about October 1st or 2nd. The ultimatum, I believe, was ready on September 27th. Mr. Reitz told me of the ultimatum on the 27th or 28th, and I have seen the first draft of the ultimatum which was sent to Bloemfontein on the 26th or 25th, and the revised draft sent back to Bloemfontein on the morning of the 27th. I believe it was entirely due to this hopeless jumble with their supplies and transport, and so on, in the beginning of October, that Joubert refused flatly to move until the 9th. The moment Joubert said he was ready to move at all, then the Government at Pretoria sent in their ultimatum.

20427. And they did get things ready?—Even then they had no proper transport, and they had not anything that we call first-line transport—proper mule transport. They had sent a certain number of wagons up

from Pretoria to the Natal border at the end of September, and a great many of the Boers brought their own ox wagons. One family very often had about three times as much transport as they wanted. The Boers I was staying with had three tents, a German cook, and several Kaffirs, and so on; but taken as a whole, they had no transport, and I know when I was at Sand-spruit Laager they shifted the laager for better grazing a distance of about three miles, and they had to do double journeys for a great part of the transport to move that three miles. I do not think they could have invaded Natal at all if we had not kindly left all the railways untouched.

20428. Is not that the system—if it can be called a system—of the Boers, that they should rely upon the individuals bringing their own supplies?—Yes; but the burghers had not got them. Later on there was enough transport, but a great many of the Pretoria and Johannesburg and Krugersdorp commandos were largely composed of townfolk, who had not their own transport to begin with; and then there were all the poor Boers, bywoners and so on, who had not adequate transport, and relied on the Government. Later on they got together much more transport from the country, but in the early stages of the war they were absolutely dependent on the railway, on the Natal side, at any rate. I do not think they could have got to Dundee for about a fortnight at least.

20429. When did you leave?—General Joubert sent me back to Pretoria on the morning of October 12th, when the commandoes crossed Laing's Nek.

20430. Then you left Pretoria when?—On the 13th. I got off with the last train that went down by Norval's Pont.

20431. And you went back to Cape Town?—Yes.

20432. Of course, we do not wish to examine you upon the events of the war, and we are not dealing with a history of the war, so to speak; but in order to put on record what your experience was, I will ask you some questions. After that you went to the front with Lord Roberts?—I went to the front in the beginning of November in Natal, and stayed there until a few days before the battle of Colenso.

20433. With Sir Redvers Buller's force?—Well, it was General Hildyard's force most of the time.

20434. And you remained there until December?—Yes, about December 3rd or 4th.

20435. And then went back to Cape Town?—Yes.

20436. And then to the front with Lord Roberts?—Yes.

20437. Which meant the march to Bloemfontein?—No, only as far as Paardeberg, and after Cronje's surrender I went to Cape Town again.

20438. After that, I think, you were mainly at Cape Town?—Mainly.

20439. So that your experience of the events of the war would be gathered from other people?—Chiefly, yes.

20440. As I said, we do not wish to take you through that, and we have it before us in the "Times" History of the War, I presume; but there is one matter that I think would be interesting to you if I just mentioned it with regard to one particular incident. Our attention was called to a passage in the "Times" History of the War, page 235, Vol. II., in regard to the battle of Ladysmith, which is called "Disorderly retirement of cavalry," and it says, "When the infantry were clear, the cavalry began their retirement. For reasons which it is difficult to understand, the cavalry were allowed to save themselves by their speed alone. No attempt was made at a judicious withdrawal by regiments. Troop officers were not even given the time to form their troops. A seething mass of clubbed and broken cavalry charged down the narrow neck on the west of Lombard's Kop, and streamed southwards into the open plain, where, after a short interval, it collected and re-formed itself." Of course, that raised a question of discipline, and so on, with regard to which we have put some questions. Sir George White referred us to Sir John French as the best authority on the subject, and Sir John French gave us evidence to the effect that the retirement was perfectly orderly?—From all the evidence I have so far been able to go into, I would still adhere entirely to what I have said there, and that passage was actually written by an eye-witness of the retreat.

20441. I do not mean to argue the matter with you, but I call your attention to the fact that we have referred it to the chief authorities, and that is the answer we got. You will find it in the evidence when it is published. Mr
L. S. Amery.
24 Mar. 1903.

20442. (Sir Frederick Darley.) However, you were not there yourself?—No.

20443. (Chairman.) I understand the chief object with which we can usefully examine you to-day is on certain points which you have stated in the précis which you have submitted to us, as to which you have formed some opinions, and we shall be glad to hear you on these points. The first point you mention is "The insufficient importance assigned to Intelligence work, both before the War, and in the field during the earlier stages of the War." If you have any observations to make on that, we should be glad to hear them?—What I mean is that, in the first place, we did not spend nearly enough money or send enough officers. The eight or ten or a dozen officers who went out did very good work, I know, but they were fewer than the men I employed myself as "Times" correspondents, and I should have been ashamed to send "Times" correspondents anywhere, or even a commercial traveller, with the sums of money they were given. The same applies to mapping—that at no very great cost they could have done a very great deal of mapping, which would have proved useful afterwards. With regard to the Natal mapping, the Intelligence Department did offer to do it, but because the Natal Government would not supply the transport, the thing fell through.

20444. We have evidence about the negotiations in Natal, and it was not quite as you have put it?—I believe, as to the later map that was done by Colonel Grant, his original estimate was cut down, and what he eventually did was only a matter of £600 or £700; but I believe the whole of Natal could have been mapped under £10,000.

20445. We had Colonel Grant before us, and we got all the details?—At Modder River there was great complaint that the maps being wrong upset Lord Methuen's calculations of the battle. The fact is that the officer who did the map of Modder River, on which the map supplied to Lord Methuen was based, was sent down only for a morning, to draw a sketch of Modder River Bridge, for its defence by one company of Infantry, and he made a map round it as far as ordinary rifle range, and it so happened that just about a mile and a half above the bridge the two rivers formed very sharp bends in other directions. I might illustrate it by a drawing in pencil (*exhibiting the same to the Commission*), which completely upset Lord Methuen's calculations. Such sketches as Lord Methuen had with him did not show the course of the rivers; and the same remark applies to Stormberg, where there was a very good map of Stormberg Station and about a thousand yards round, but no proper map of the country beyond that, the idea being, apparently that you could have a tactical attack upon Stormberg Station or upon Modder River, but that there were not likely to be any strategical movements of troops in the district.

20446. But, as you say, these maps were formed for the protection of posts?—Yes. If you protect posts it is probable that troops may be moving in the district, and you really want maps for the whole district.

20447. (Viscount Esher.) Have you got all those maps, or copies of them, or have you had them in your possession?—I have had them in my possession at one time or another, and I think I have got most of them myself. There were other similar cases. Again, the Intelligence Department does not only deal with maps and the mere number of the enemy's troops, but all sorts of things, like water supply, the character of the different commandants, and the supply of food in different places. I believe that Lord Roberts' original idea was to march from Orange River Bridge to Springfontein, and not as far north as the Kimberley-Bloemfontein route, but that he could get no information when he first arrived in South Africa as to whether there was water available on that route. In the field I do not think nearly enough importance was assigned to the Intelligence officer, and anybody was made Intelligence officer; there were not enough of them, and they were hopelessly overworked. As a rule, any junior officer was made Intelligence officer, and he probably had to do

Mr.
L. S. Amery.
24 Mar. 1903.

press censorship and permits as well. In one case at Estcourt there was a Lieutenant, a very capable young officer, who did very well afterwards, and after we had been there a fortnight or more altogether, I was referring to a very important feature—a wall running right outside the village of Estcourt—and I found he did not know of its existence, because he had arrived at Estcourt at night, and had never been outside the hotel into which he went, because he was so fully employed with issuing permits, map-making, and other work; but to have an Intelligence officer who does not even know the visible features of the place outside is not a good state of affairs. In the same way, when General Gatacre marched to Stormberg, he left behind that day the officer who had been his Intelligence officer up till then, who had been at Stormberg all the time, and knew the district intimately, and there is no doubt that if that officer had been there, as he knew the particular farms where the force halted on the night of the march, he could have told General Gatacre exactly where he was, and where to go to.

20448. What is the general inference you draw from all that?—That neither did the Government as a whole nor the War Office value Intelligence enough before the war, nor did individual Generals attach sufficient importance to their Intelligence officers in the field, or run enough risks to get intelligence. To get proper intelligence you ought to be losing a certain number of scouts every week; but, as I often saw myself, the scouts used to go out in the morning, after daylight, and ride till they saw the Boers in the distance or heard from Kaffirs that there were Boers there, and then they came back. That sort of intelligence is not worth much. A General ought to see that a certain number of his scouts get shot every day; that shows they are in proper touch with the enemy. There was in these matters no sort of judging of proportion on the part of generals; it was considered dangerous to send a man out to scout the enemy's position if there was a chance of his getting killed, although that was not at all dangerous for the Army, being only one casualty; on the other hand, it was not considered very dangerous, as it ought to have been, to lead a whole division against an unreconnoitred position.

20449. (*Chairman.*) In saying that you rely upon what you have been told?—Yes, mainly, though in this case I was thinking rather of when we were lying before the Colenso position, shortly before Colenso. I remember riding with the scouts round the base of Hlangwane Hill. We started in broad daylight, and came back early in the afternoon; we rode near the base of Hlangwane, and stopped at Kaffir kraals. We took a little precaution not to be seen, and we heard the Boers were on the hill, but if we had run any risks, it would have been perfectly easy to stay till nightfall and crawl up the side of Hlangwane Hill. It would have been perfectly easy, also, to go down the course of the Doornkop or Gomba Spruits, or to wade or swim across the Tugela at night.

20450. If, in the course of reading the evidence hereafter, you find that we have received information from officers of that sort of thing having been done, it would a little modify your opinion?—Yes, I know that that sort of thing was done sometimes, but I do not think it was done nearly enough, especially in the earlier stages. At Colenso there is this Doornkop Spruit, which is wrong on all the maps; it runs a matter of two or three miles further down the Tugela, and that might have had a considerable effect on the battle. It would have been easy to crawl down the bed of that spruit opposite the Boer position.

20451. (*Sir John Edge.*) Those were military precautions which the officers in command ought to have taken?—Yes; which they ought to have insisted on. Similarly, I believe it would have been easy for officers to have gone in and out of Ladysmith at any time. People volunteered to do it, and they were told not to endanger themselves. The Kaffirs did it freely, although they ran the risk of being shot whenever they were caught. I do not think General officers used to let their officers run nearly enough risks to get information. I consider it would have been perfectly easy to have sent a dozen junior officers across the Tugela every night, to crawl about the Boer lines: three or four of them would have got captured, but the rest would have brought back valuable information. In the same way, I think agents should have

been kept in the Boer laagers at the beginning of the war much more than they were. I myself found no difficulty in passing as a member of the German contingent when I was riding about from one Boer laager to another, and there was no proper precaution taken by the Boers.

20452. (*Viscount Esher.*) Was that after the war had broken out?—No; but just the week before. It would have been easy to send men out into the Boer laagers, and their discipline was so slack that that could have been done without any great risk.

20453. Did you yourself send any men paid by the "Times" to go into the Boer laagers?—No. Perhaps I should quote another experience of my own of the sort of inferior Intelligence officers who were used, and the lack of interest shown. After Willow Grange battle the Boers were all between Estcourt and Mooi River, and cut off the two places, and as I did not want to be separated from the "Times," I rode that night through the Boer lines, and got into Mooi River about four or five the next morning. I went to the Intelligence officer there, and said I had just come through, and he asked me what I wanted. I said I could give him information if he did want it, and he hummed and haw'd, and finally gave me his Intelligence notebook, and said, "There, write in that anything that occurred to you," and went out of the room. He apparently had no questions he wished to ask at all, and I put down what occurred to me; but, as a civilian, I really did not know what information General Barton might be wanting at that moment. Then there was another thing. I do not think on our side information was sufficiently given by headquarters to subordinate commanders; good information used to come in, but it did not go round to everybody to whose interest it might be to know it. The Boers did very well in that way, and they kept each other posted up.

20454. Did our officers complain of that?—I have heard a great many complaints of that. The Intelligence at Delagoa Bay sent in August and September, 1900, very full information about the Boer movements and their plan of escape round to the north through the bush veld, but somehow that never seems to have properly reached the people for whom it was intended; at any rate it was never acted upon in any way. On the other hand, the Boers did keep each other posted up very well, and I have had a great number of these Boer telegrams from different villages in my hands, and they took a lot of trouble in that way.

20455. (*Chairman.*) Did they use the telegraph for that purpose?—Yes; the Boer telegraph and heliograph system was very good. They took a lot of trouble about it; they had a lot of telegraph lines, and they kept their telegraphic communication going almost to the very end of the war, using our lines or running up new lines.

20456. They had no field telegraphic system?—Yes, and it was under a Lieutenant Paff, of the Field Artillery. I know down at Sandspruit he did very good telegraphic work. I think three days after the battle of Ladysmith all the Boer laagers round Ladysmith, in a circle of 20 odd miles, were connected by telegraph and telephone. Although their resources were less, they took infinitely more trouble than we did about that subject of communication.

20457. We have had a great deal of evidence about the telegraphic system, and in Ladysmith, for instance, they had a regular telephone system?—Yes, that is inside Ladysmith; but the Boers also organised theirs round Ladysmith at once.

20458. (*Viscount Esher.*) I suppose that all the information, or nearly all, which you have given in the "Times" history of the war has been supplied to you by officers?—Yes.

20459. Leave was given to the officers practically to supply all that information to you, was it?—Yes, for confidential use.

20460. Was there not an order of Lord Kitchener's issued?—Yes, there was a temporary order, which really referred to a circular of Mr. Lionel James, and for some months officers in South Africa were not allowed to answer that circular, but I saw Lord Roberts about it the moment I heard from Mr. Lionel James, and he wrote to Lord Kitchener. Lord Kitchener then amended that order, and said that anybody who knew Mr. Lionel James personally could answer his circular. I do not think that the question

of answering any letter I myself wrote to any people I knew ever came into question. When I went out myself the second time I saw Lord Kitchener, and got a circular letter from him to all officers that they were at liberty—

20461. Empowering them to give evidence to you?—Yes; that they were at liberty to supply me with information for confidential use.

20462. (*Sir Frederick Darley.*) May I ask who organised the Boer telegraph or telephone system?—A certain Lieutenant Paff.

20463. What countryman was he?—I think he was a Boer. I knew him slightly.

20464. Had he served as an Engineer officer?—No, he was a member of the Boer Staats Artillerie, but they had a telegraphic section of the artillery, and he was head of it.

20465. (*Chairman.*) You now wish to speak about staff work and the question of a general staff?—That is a large subject, but what I mean is that there was really in the first place before the war nothing really deserving of the name of plan of campaign. The question was discussed to some extent no doubt, and the Natal route was decided upon as against the Cape route; it was decided to use the Cape line and to use the three Cape seaports, but that sort of thing was the mere rudiments and skeleton of a plan, and there was no careful elaborate working out what the Boers would do and what their railway service would do, and where they would concentrate. In fact, the lack of a proper strategical judgment of the whole military situation was shown by the difference between the size of the force which the Government were assured by their advisers was sufficient for the defence of the British colonies in South Africa, and the force they were told would be required for the subsequent offensive movement. The defence has only an advantage when it has some natural obstacle, some conformation of the frontier to help it, or when the defender can fall back through friendly country, trusting the enemy will be weakened by advancing; but our positions in South Africa were so situated that although they were good for offence, they were very bad for defence indeed, and, in Cape Colony at any rate, the further the Boers advanced the greater amount of strength were they likely to get; so if 75,000 men were required to march to Pretoria it would have required fully 75,000 to hold the frontiers of Natal and Cape Colony. The origin of the difference was, I believe, as follows: The authorities, having no proper means of forming an estimate, in an off-hand sort of way, simply asked General Penn Symons how many men he wanted to hold the whole frontier line of Natal to Laing's Nek, and he formed his own estimate. I do not suppose that sort of estimate can be considered as worth very much, but he asked for 6,600 men, and I think 6,700 composed identically as he asked them to be were sent from India, and the theory on which they were sent originally was that they were to defend Natal and all round the frontier to Laing's Nek, and down again.

20466. May I ask where you got that?—It is all in the Blue Book; the whole correspondence is there. General Penn Symons is asked how many men he will want, and he says he will want so many to hold to Dundee, so many to Newcastle, and so many to hold the whole of Natal, and they sent him just what he asked for. They had no proper department to think out the problem of the defence of Natal; they simply took General Penn Symons' estimate without any knowledge of what his powers of forming a just estimate would be. As for the problem of the advance into the enemy's country, they simply took the existing organisation, and said it would want an Army Corps, without considering how far an Army Corps was adapted for the particular conditions. To repeat, if 25,000 men at the beginning of the war could have defended the frontiers of Natal and Cape Colony against the Boers, they ought to have been amply sufficient to march to Pretoria, as the frontiers were so badly placed. But if on the other hand it did want a large force to march to Pretoria you evidently were insufficiently prepared for defence, unless the whole scheme was based on the assumption that the Boers would practically do nothing at the outbreak of the war. If there had been any adequate strategical department it could never have committed such a folly, as to draw a hard and fast line between the defensive and offensive parts of a campaign in a territory possessing no defensible natural positions. As it was the Intelligence Department got some information, and the heads of the War

Office glanced at it in their spare time, and having been in South Africa themselves 20 or 30 years before, gave their personal impressions to the Government, but the whole thing was sketchy and worthless.

20467. There is a different view, is there not, that the General in the field must be allowed a free hand?—Yes, but that does not conflict with what I suggest; before a war you must have proper preparation, very full information, and some scheme of campaign, and then you can allow your General a free hand.

20468. I wanted to bring out exactly how you meant it?—I do not imagine there should be a rigid plan of campaign telegraphed daily from London after war has begun, but you must have some fully worked out plan, and the mere operation of thinking out a plan beforehand would prevent your committing such absurdities as were committed at the beginning of the war.

20469. (*Sir Frederick Darley.*) What is it you complain of, that there were not sufficient men there at the beginning of the war?—Either there were not sufficient men or the force that was sent afterwards was too large; if the first force was sufficient for defence then the other force sent afterwards was too large—which, of course, it was not. If it did require 75,000 men to march to Pretoria then the force left to defend Natal and Cape Colony was evidently hopelessly inadequate.

20470. (*Sir George Taubman-Goldie.*) When you use the words "sufficient for defence," you mean sufficient for defence of the whole of our frontiers?—Yes.

20471. You do not mean sufficient to prevent them seizing our seaports and driving us out of South Africa?—No, the idea was that we should hold the whole of Natal. In Cape Colony it was important to hold our frontiers, because the population was on the side of the Boers, and the advantage of the defence is either that you can hold a very strong line somewhere, or else, if you fall back into the interior of your own country, you make his communications longer and his difficulties greater, but neither of those things applied to the Boers.

20472. But what I want to put forward is: You realise, of course, that in the British Empire we cannot keep an army ready for war in every part of our possessions?—Quite so.

20473. And on the point as to what would have been a sufficient force for practical defence in South Africa at the commencement of the war, there is a great distinction between having sufficient men to hold the essential points in the country without their being actually taken possession of by the enemy pending the arrival of reinforcements, and having sufficient men to smash two military Republics such as the Transvaal and the Orange Free State?—Yes, but if we had had a more clearly thought out military policy, and worked it more hand-in-hand with our political negotiators, it might still have been possible to have strengthened our position in South Africa more before the actual outbreak of the war.

20474. Yes, with a view to defence prior to the arrival of reinforcements?—When one talks to the politicians one sees that, during the months just before the war, they were all under the impression that our Colonies had been made perfectly safe, and that they would remain perfectly happy, even if war broke out, until we chose to make a forward move, and that then all that was required was that the expeditionary force should start marching to Pretoria.

20475. I only want to draw a distinction between the number of men who ought to be kept in a place where war appears at all likely—men sufficient to hold places like Cape Town, Durban, Maritzburg—the principal fortresses—and places like Kimberley, of great money value, and generally to hold the country without trying to protect the frontier and the number of men that might be necessary—it might be 100,000 or 200,000, and it turned out to be 400,000—who were necessary to absolutely take possession of the two Boer States?—Yes.

20476. The distinction I have drawn seems to me to apply rather to the case of Bosnia with Austria; it took Austria a very large number of men, 200,000 at least, if not more, in order to quiet Bosnia, but no one would have expected that Austria should have kept 200,000 men as a garrison of Bosnia in the early stages?—Of course Austria had several hundred thousand men within close reach of Bosnia all the time.

Mr.
L. S. Amery.
24 Mar. 1903.

Mr. 20477. (*Viscount Esher.*) Still, it took two years, as
L. S. Amery. well as 200,000 men?—Yes.

24 Mar. 1903

20478. (*Sir George Taubman-Goldie.*) I only want to draw that distinction, and to ask you whether you in your evidence draw the distinction between having a sufficient number of men to hold the vital points pending the arrival of reinforcements, and having enough men to undertake a war of conquest?—Yes, but in this point I was discussing not so much a war of conquest spread over a vast area, which again would have required a much larger force, but simply the question of the forward movement to get as far forward as Bloemfontein and Pretoria. I think the idea then was that the capture of the capitals would probably decide the thing, as it very probably would have done then. What I meant was that the force required simply to march to Bloemfontein and Pretoria would have practically been required to defend our very awkward frontiers.

20479. Yes, to defend them fully. I do not speak of South Africa because I know that certain people have views with regard to keeping troops there, but we could not afford to keep 80,000 men in every part of our Empire?—Oh, no; I only meant really to draw attention to the point that if the thing had been more thought over by a responsible department in touch with the Government the whole negotiations and the military policy would not have been so separated by a sharp edge as it was, nor would the Government ever have been under the impression that the defensive force there would defend our Colonies in the sense in which you hold the door of a house.

20480. (*Viscount Esher.*) Supposing they had thought it out; is it your idea that a larger force would have been permanently maintained in South Africa, because that is what *Sir George* means, or do you mean that just before the war larger reinforcements should have been sent out than were sent out?—I should think that if there had been a department that had thought the matter over, the forces in South Africa would have been gradually increased some time before, and both the forces there and some of our forces at home quietly prepared for South African conditions.

20481. How long before, because that is the point?—They would have thought out the matter; it might have been a year before.

20482. Do you not see that political considerations come in there directly; and, therefore, at what point would you suggest that larger reinforcements should have been sent out?—Of course, the fear of the Government was to draw attention by suddenly sending out large forces, but I suppose there could have been gradual and not very striking reinforcements extending over a year or so beforehand.

20483. Have you any reason to think that the military authorities did not draw the attention of the Government for a year or two before to that very point?—I dare say they did.

20484. That is the point; you must not assume that it was the want of military foresight; it may have been political considerations?—I think there is a difference—

20485. (*Sir Frederick Darley.*) Would not the considerable increase of men there, which you think was necessary, have precipitated the war?—Not if it had come about gradually; the sudden mobilising and sending of men at any moment during the last three or four months would have precipitated the war. The Boers were ready to go to war the moment they saw we were strengthening our hands very strongly.

20486. (*Viscount Esher.*) When you were in South Africa in the months immediately before the war, did the military people you saw there complain very much to you of not having larger reinforcements sent to the Cape?—As far as I remember they spoke of Cape Colony being defenceless.

20487. What was the political view? Did I understand you to say just now that their view was that they were perfectly safe, and that the actual initiative would always lie with them? Was that what you said just now?—I referred to the politicians at home. I think the politicians in South Africa had a sort of general confidence in the British Army and the British Empire, and they thought it would be all right the moment the troops came out.

20488. (*Sir George Taubman-Goldie.*) I just want to get this second point quite clear; the first point has

been threshed out now, but on the second point do you hold that if it required 80,000 men to march to Bloemfontein and Pretoria, and to occupy the country in the first instance, therefore we should have kept 80,000 men in South Africa during those three or four years of tension?—No; therefore we should have tried to strengthen our forces to as nearly as possible that amount before the moment of the ultimatum came; when the political people saw the ultimatum was imminent, day by day almost, they ought to have tried in every way to make every preparation to bring the thing up. There are many ways in which preparation might be made without actually adding to the number of Regulars sent from England. Transport could have been got together, for instance.

20489. The point is this, that there are two distinct things, whether they had a sufficient number of men for the practical defence of the country prior to the arrival of reinforcements for the forward movement—that is one question; but it seems to me that your evidence goes to the effect that in your point of view we ought to have had, not for the defence pending reinforcement, but originally in the country, 80,000 or 100,000 men for an offensive movement?—No, I did not mean that.

20490. I am glad I have elicited that fact?—I only meant that the moment they saw war coming near the Government ought to have realised something as to the size of the war, which it did not, and should have taken every step to increase the forces and to hold over the last strain until they had more men there. The Government were under the impression that the men they had there could, so to speak, hold the door until the new forces came and walked through it.

(*Viscount Esher.*) There again you have the political situation; you are urging political considerations, and not military considerations; that is a question one might argue to the crack of doom, depending on the particular view you take of politics, but that is not a military consideration.

20491. (*Sir George Taubman-Goldie.*) It is not a question of the general staff?—The carefully weighed opinion of the general staff with the authority it would have, based on a very large amount of information, and worked up, would have carried much more weight with the authorities than the offhand statement of the Commander-in-Chief or the Adjutant-General who had happened to be in South Africa a number of years before, and perhaps just quoted a little hand-book made up by the Intelligence Department.

20492. (*Viscount Esher.*) You have no reason to suppose that the authorities you blame would not admit—they probably would—that they were perfectly alive to the fact that there were not sufficient troops in South Africa; if they made that admission your argument falls to the ground?—But they do not; I have always heard them make the other one.

20493. (*Chairman.*) We quite understand what you mean; that if the question had been worked out adequately you think there would have been information before the Government which would have induced them to decide otherwise?—Yes. Now to come to my next point. I mean with regard to the staff work generally throughout the Army there was no clearness about the functions of the staff officer in war; somebody who was a very good fighter, because he wanted to be in South Africa, was attached as Chief Staff Officer to somebody, although he had no staff officer qualifications; others were good staff officers in peace, and excellent men to know all the Army orders and to fight with the War Office from Aldershot, but were not good fighting staff officers. I do not know that there is any good of giving instances, but the fearful staff muddling was in everybody's mouth, and with regard to many of the things that went wrong you invariably heard people say, "The staff was so hopeless," or "We were never told this." At the Battle of Ladysmith the staff work went to pieces very badly. Other instances besides Ladysmith were Stormberg, Modder River, and the loss of the Watervall convoy, and there were many other unfortunate incidents with regard to which bad staff work had a great deal to do.

20494. (*Viscount Esher.*) Is it your view that there are not enough staff officers, or that they are not properly trained in peace time?—That they are not properly trained, and that you want one school of training, a real general staff school, and that rather comes to another point—that there was a lack of co-operation between our different forces very often, because there

was no *esprit de corps* of the general staff, and each General had a natural tendency to play for his own hand, and his staff officers, instead of looking at the end from the point of view of the Army, were his own personal adherents, and magnified the quarrels that there were, and the selfishness.

20495. (Chairman.) Although the General chooses his personal staff he does not choose his general staff?—Still, they become his personal staff because they have not a pre-existing *esprit de corps* as a staff.

20496. There is the Staff College training, and the Staff College officers are appointed to the staff?—They pass through the Staff College, but that is not the same thing as having a permanently existing general staff, of which an officer would feel proud of being a member, and of being constantly in touch with the other members. The only *esprit de corps* we have at present is regimental.

20497. Do you mean that an officer appointed to the general staff would be cut adrift from the regimental work altogether?—I believe in the German Army they do send them back occasionally, but still his main interests and his main loyalty would be to the general staff.

20498. That is contrary to the bulk of the evidence we have received?—

20499. (Viscount Esher.) I understand what you mean is that you ought to have a Staff Corps, just as you have a Commissariat Department, and just as you might attach a Commissariat officer to a General Officer Commanding, and he remains in spirit a Commissariat officer, so you would like to see the staff officer attached?—Yes, and he would remain in spirit attached to the general staff of the Army.

20500. (Sir George Taubman-Goldie.) As a matter of fact, supposing the new Army Corps scheme is ever carried out, is not that largely the principle of it—that there is to be a body of staff officers attached to each Army Corps?—Yes, but they are not attached to each other; the staff officers of one Army Corps are not in intimate connection with the staff officers of another Army Corps, and they have had no common school of military training or thought.

20501. At the Staff College?—Yes, but that is not enough; that is only the theoretical teaching; they may have had the same lecturer perhaps, but what you want is a general staff where future campaigns are worked out, and discussed, and so on, and where you get a common sentiment and a common theory of war, which, of course, is very useful.

20502. In London?—Largely in London, and then sent out to the different Army Corps as it is in the German Army.

20503. I wanted to see whether you drew a distinction between the general staff in London and the general staff in the field, because they are two perfectly distinct things?—The officers who are attached to the different Army Corps or divisions would have had their training or part of it in the general staff in London, and the staff officer in the field would also have been some of his time in the general staff in London.

20504. (Viscount Esher.) You see in order to create that *esprit de corps* which you think desirable, a man who had been once a staff officer would have to remain a staff officer, because the moment he goes back to his regiment you break down that very spirit which you think should be encouraged?—I do think the majority should do as I suggest; you might have a young officer on the staff for three years, and send him back to his regiment, but if you bring him back to the staff again after that he should remain a staff officer.

20505. That is a detail. But what I point out is that if a man is in the 17th Lancers, and you take him temporarily out of the 17th Lancers and put him into the Staff Corps, knowing he is coming back again, his loyalty would probably remain to his own regiment, and your idea is the converse of that?—Yes.

20506. You see what you are doing; you are then taking a number of men from the regimental arm of the Service and creating them into a Staff Corps. That is your suggestion?—That is exactly what I want, and what I think absolutely necessary.

20507. Have you thought whether they could be adequately employed in time of peace?—That is the whole point; you want a staff which will not be overloaded with routine work in peace, but will have leisure to prepare itself scientifically and thoroughly for war.

20508. (Sir George Taubman-Goldie.) You would require a very large number of staff officers in time of war?—Yes, in time of war you would have to create a certain number of new ones, but the people who had passed through the Staff College and gone back to their regiment could in time of war come out again, and do staff work.

20509. That is exactly what is proposed, except that you have not one central office for it, but you will have a central office in each Army Corps. Assuming the three regular Army Corps to be created, it is proposed that there should be three sets of staff officers all working together, and learning to know each other?—Within the limits of the Army Corps that is very good.

20510. Within the limits of the Army Corps you are satisfied with that?—Yes, but that is not quite enough for the whole Army, because at times different Army Corps, or parts of different Army Corps, may be in contact, and then you will find that there are different schools of military thought. That is one reason why the operations often were so very centralised, and subordinate officers were not given a free hand. A Commanding Officer could not know how certain Generals or their staff would act under given circumstances, but if there had been a common military training or a school of military history or strategy in connection with the general staff he would have had a much better idea, and have been readier to give them a free hand.

20511. The great bulk of the staff officers would have to do with the Army Corps, and there would be only a small proportion in London?—There would always be a large number permanently in London on the "great general staff," as the Germans call it, and the others would be passing through it from time to time.

20512. I do not think there is very much difference between your scheme and that proposed under the Army Corps system?—All the difference in the world. The one is a general staff and the others are local and temporary staffs.

20513. (Viscount Esher.) Has it not often struck you that the faults attributed to the staff are very often the faults of the General Officer Commanding, who does not know how to utilise the staff?—Yes.

20514. That is a conceivable proposition?—Yes, that is largely because there is not a general school of staff teaching.

20515. Can you not also imagine that the staff which has failed under one particular General, owing to his not being able, as I say, to utilise his staff properly, might succeed under another man?—Yes; but the fact that the two did not always fit together would have occurred much more rarely if you had had a proper staff system at home.

20516. You think the staff ought to work the General under those circumstances?—Yes; or rather that Generals and staffs should be trained in the theory and practice of working together in time of peace.

20517. (Chairman.) Would you pass on now to the next head: "The need of training men and animals under realistic conditions"?—I mean that much more attention should be given to marching about and looking after yourself, and I should think the company officers ought to take their men about much more; the sort of training that is given in running a Polytechnic tour would be most useful.

20518. We have had a great deal of evidence from various officers very much in that direction; of course, as you are aware, there is a difficulty in this country in giving them opportunities?—There are other countries where you could do it more easily, South Africa for instance. One of the worst defects of our soldiers is that they will not exercise sufficient restraint in food and drink, and so on, because they always live in barracks, and come back to meals at certain hours. If you could give the men some training by which they actually get to know by experience that so much food can last and has got to last for a certain number of days, it would make all the difference in your operations. When you want to make a march round the enemy's flank, you have to consider, can you trust your men to carry their rations for so many days, and if the General says to himself "I cannot trust them," then he has to give up what might have been a big success. Similarly about the horses; our horses were not trained for war at all, they were kept in the stable, and the soldier knew how to look after them in the stable, but not out

Mr.
L. S. Amery.
24 Mar. 1903.

Mr. L. S. Amery. 24 Mar. 1903. of doors, and they were the wrong kind of horses. In war the great essential for a horse is that he should be thoroughly tame and without nerves, and that he should be a determined feeder, eating whenever he has a chance. The Boer horse was splendid in that way; you threw the reins over his head during a battle, and he commenced grazing at once. For getting wounded men away in a hurry it is hopeless to use horses that are easily frightened. If you had 400 Boers going to hold a kopje it meant 400 Boers in the fighting line and three or four Kaffirs just preventing the horses straying too far, whereas if you had 400 British mounted infantry every fourth man was holding horses, and you only had 300 men in the fighting line, and you got beaten. With cavalry, especially Lancers, the proportion was even worse. As far as food and the other things you have to drag about with you in a campaign are concerned, you had to look after 400 men, however. It became still worse when you got the horses brought out in great cargoes from one part of the world, say the Argentine or Australia, to men who were not accustomed to that sort of horse, while the horses were not accustomed to being ridden in that sort of way. The Argentine is ridden in his own country with a peculiar saddle and stirrups. I believe it is a very good horse in its own country, but it arrives utterly done up, and is taken up country by train, not fed or watered on the way, and then a soldier who rides in a different style is put on board of it. You must have your horses trained together with your men, and trained for war.

20519. (Sir John Jackson.) The Boer horse you maintain is not a horse of the same spirit as the English horse?—No, it is a campaigning horse, a horse accustomed to rough it, and to go long distances on short food, and it will stand still while its master is hunting or shooting.

20520. So far as the noise of battle and guns and that sort of thing goes, the Boer horse is more experienced than the British horse?—It is accustomed to stand still with a man shooting from or over its back; that is a thing the Boers frequently do. They use their ponies for stalking purposes, shooting across their backs.

20521. (Viscount Esher.) How would you realise that? How would you propose to train a sufficient number of horses?—In the first place, I think you could keep horses in paddocks, and teach the men to run out and catch their horses.

20522. Are you speaking of cavalry?—And mounted infantry, too. We ought to have a large supply of horses trained to campaigning conditions; in fact I think if you pay a money grant to Volunteers, so that they may be able to shoot, it would be almost worth while paying a money grant to anybody who could produce a horse which would stand still and go on grazing while you fire a gun off.

20523. These are the sort of temptations you would offer to people in this country?—Yes, you could do a great deal in this country, but you could do a great deal more in the Colonies. Generally, I think if you could draw more distinction in the soldier's life between that part of it which is meant to be imitating war, that is the real roughing it, and the part which is ordinary life in barracks, it would be better. If you make him comfortable in barracks, and he understands he is to be taken out for a month or two real campaigning, he will not mind the hardships much, but what he objects to is living uncomfortably in barracks with the idea that the Spartan life there will make him fitter for war.

20524. (Chairman.) The next point is with regard to the long-range rifle and the smokeless powder; we have heard a good deal about that also, and the conditions prevailing in South Africa, which I suppose you recognise were peculiar?—Yes. The point I really particularly want to make is the physiological one, the question of running. Taking a man in boots and ordinary clothes, with a rifle and ammunition, the distance to which he can run without getting thoroughly exhausted and blown is about 400 and 500 yards. Under the old ranges the theory was that you crossed the open ground and you got into the enemy's position, a certain number of men getting shot on the way. Under present conditions, if you have an open field of fire of a thousand yards or more to cross, it does not become a question at all of the proportion of men who will remain unhurt at the end to carry through the charge, but before you are half-way across all the men are lying down on the ground utterly blown, with their mouths parched, and unable to go on. The point is that the human

wind will allow you to run at a reasonable speed—I am not talking of track running, but of the exciting and exhausting conditions of battle—for 300 or 400 or 500 yards, and it will not allow you to run 1,000, and the result is that with men on foot the old-fashioned infantry charge across level ground is no longer possible. The only way you can carry out the old-fashioned infantry charge is on horseback, and in all the later part of the war (I suppose you have had plenty of evidence on that) our cavalry leaders used to gallop any position with mounted troops in loosely extended order, and almost invariably with success.

20525. (Sir George Taubman-Goldie.) What is your deduction?—That you want large numbers of mounted troops, if you are in South Africa or a great part of India or Persia, to take positions by charging; if you are attacking with infantry you can only do it by crawling and stalking. If you want to charge a position you must do it with mounted troops.

20526. You mean more mounted infantry?—Well, mounted rifles or cavalry; that is a question of definition, but they must be good enough horsemen to carry through a charge at the gallop. Another point in favour of mounted troops in open country is that infantry cannot escape; if you get half way up a kopje or anywhere, and then get the worst of it, it is quite impossible to walk or run down and get back over a thousand yards of open ground, with the enemy on top firing at you; in fact, it means a surrender; whereas if the thing does fail in a mounted charge you double about and gallop off, and remarkably few men get hit.

20527. How far would you go—to the abolition of dismounted infantry altogether?—No, but I would almost abolish them in a country like South Africa.

20528. How about wars in Canada?—In Canada you would, I imagine, mainly use mounted troops.

20529. In a great many parts you would not?—I do not mean to say the infantry should be abolished, but their tactics have become different; for charging tactics you must have mounted troops.

20530. (Viscount Esher.) What is your proposition—that all infantry should be trained as mounted troops?—No, only that the proportion of mounted troops should be very much larger, especially in our Foreign Service Army, which is likely to fight in open country. On the other hand, with troops required for the defence of England, the proportion of horse mounted troops would be very low.

20531. (Sir George Taubman-Goldie.) We have no idea where we are going to fight; we do not think we are to fight again in South Africa just yet?—No.

20532. (Viscount Esher.) In that part of Natal you were in, do you consider that mounted troops would be as effective and as useful as they were with Lord Roberts in his advance?—Yes, they would at any rate gallop to the foot of the hill, though a certain amount of it might have to be done climbing.

20533. I suppose you are not in favour of diminishing the cavalry forces of the country?—No.

20534. You are not in favour of substituting mounted infantry for cavalry: that is not your point?—No, I should not like to go into the question of where the exact boundary line comes. The cavalry has been modified considerably since the war. All I mean is that mounted troops who are really good horsemasters, and good scouts, and something better than infantry put on horses will be wanted; that is my main conclusion.

20535. (Chairman.) As to attack and defence under modern conditions?—I see it said very generally that the defence has gained, and I think that an absurdity. Strategically, the offence is as good as ever it was. Tactically, one particular form of defence has gained enormously, namely, where you have a very wide open field of fire and good cover yourself. But that condition does not exist everywhere, even in South Africa. It is not easy anywhere to select a defensive position of any size protected by such a complete glacis, and which cannot be approached across ground affording cover to the attack on one side or another. Against good men, who can make good use of cover and are good shots, the defensive position is perhaps weaker than ever it was if the attack is skilfully handled. The great weakness of the defence has always been that it does not know where it is going to be attacked. Modern extension and the great range of the rifle have not altered that; even if the defence has a great open glacis in front of it on one side, all you need do, as the attack-

Mr.
L. S. Amery.
24 Mar. 1903.

ing party, is to post a few men on your side of the glacis, so that the offence cannot break out there, while you secretly concentrate your forces to strike home where the defence is weakest. After all the offence succeeded countless times in the late war; again and again with weaker numbers on their side the Boers have taken positions simply by making better use of ground. Or are we to assume that the Boers were so infinitely superior to our men that no deduction can be drawn? At Elandslaagte and Driefontein, where our men were well handled and a fair use was made of the ground, they attacked successfully. In my opinion the only conclusion is that skill is now of very much more importance, and the more skilful force, whether smaller or greater, will be able to carry out the attack, and that the defensive position, unless very well chosen indeed, is weaker now than it used to be. That is one of the things I have been struck with in talking to many officers—the great difficulty of finding a position to defend which is not commanded by other positions affording support to the attack. If you take the one instance of Nicholson's Nek, there was this isolated hill, with a number of other hills standing about one thousand to fourteen hundred yards away; under the old conditions these hills would not have come into play, and this hill had command of all the open ground round about. With the new rifle the whole of these hills were occupied by Boers keeping up a heavy long-range fire; a great part of our force was diverted to reply to that fire, with the result that the party of Boers who carried out the attack under De Wet brought a much greater volume of fire to bear on the weakest part of the position than they received in reply from the small fraction of the Gloucesters and Irish opposed to them. If you take Waggon Hill as another case, Waggon Hill would have been much more defensible with the old range rifle than with the new one, because it was heavily swept with rifle fire from Mounted Infantry Hill and a number of other points, all about one thousand yards away, which would not have come into play with the old rifle; so that I do not think there is any evidence to show that the defence has gained over the attack except in the one particular case when it is protected by over a thousand yards of open ground. Of course, if the attack is stupidly conducted it will lose more than it did before, and seem more hopeless. The advantage lies simply with the side that is more skilfully handled. And in so far as skill has more opportunity of showing itself in action rather than in inaction, I should say that the offence has gained rather than the defence.

20536. That leads to your next point, of quality against numbers?—Yes, that really comes to the same thing; I believe skill and character are almost everything. If you talk to officers who have been out there, you will find that what they always reckoned was not how many men they had with them, but had they the so-and-so Yeomanry or the so-and-so Yeomanry with them; for instance, some squadrons of Yeomanry were considered of more value than a whole brigade of others, and others again were not worth a section of infantry. There were troops like the Imperial Light Horse, to give an instance, who were worth an enormous amount of other troops. On the other hand there were some of the troops raised at the latter end of the war, as, for instance, the people who ran away at Lord Methuen's defeat.

20537. (*Viscount Esher.*) Can you be sure that the same principle is going to apply in European conflicts?—I should think so very largely.

20538. Of course it is contrary to the experience of previous wars?—The previous wars have been tests of general organisation rather than of this tactical question.

20539. Over and over again; in fact, in the great majority of cases, you have found that the big battalions walked over the others?—The Germans had the big battalions, but they had a lot of other things as well.

20540. Take the battles which were fought in the last century?—In the American Civil War victory was not always with the big battalions.

20541. The Franco-German war, in any of the battles that you can think of, the attacks were ultimately successful in nearly every case owing to the great masses of men who were brought to bear on some specific point?—Yes, but that was mainly a question of skill in the strategical concentration. Besides, the two sides were fighting on more or less the same tactics. The French were not individually more skilful; that

issue was not put to the test. Two thousand men will always beat a thousand of the same quality, but they will not beat a certain other thousand men. The big numbers had great difficulties in South Africa.

20542. That is hardly an argument for reducing your two thousand highly qualified men, if you can get them, to one thousand?—If you can get the highly qualified men the more the better—a million if you can get them.

20543. (*Sir George Taubman-Goldie.*) You would say, if you could afford them?—Yes.

20544. That is as far as Europe is concerned?—Then it comes to be a question of countries where there is great difficulty about water supply, and where transport forms the principal item. In those circumstances the advantages on the side of the small force are very great; you can undertake movements which are absolutely impossible for a large army. Take the instance of a country like Montenegro; it held out against the Turks not so much on account of its fighting qualities, but because when the Turks brought large armies they starved before they got far into the country, and when the Turks brought small forces they were not sufficiently superior in quality to the Montenegrins to secure victory.

20545. (*Viscount Esher.*) But you are quite confident that you are not being misled by the nature of the war in which we have just been engaged?—No, I think not. I have always tried to keep—

20546. To keep yourself free from that influence?—Yes, still I do admit that the difference between fighting in England and fighting in countries like Canada or Persia or Manchuria is a very great one, and that the argument for small numbers and great mobility is much stronger in the case of foreign uncivilised countries than in the case of Europe.

20547. (*Sir Frederick Darley.*) You must have a considerable number if you want to take flanking movements?—If you take Jackson's fighting in the Shenandoah Valley he had only about 16,000 men, and had 170,000 men against him; on the other hand, he never met in battle more than about 10,000 of the enemy, as he always walked round them, and beat them in detail. It is just for flanking movements that you want to have a force which can use even the small roads and do with limited supplies or live off the country.

20548. (*Sir George Taubman-Goldie.*) That assumes you can change your base at any moment, and not require a long line of communications with a fixed point to get your supplies?—Yes. With a big force you cannot, but with a small force you can if it is tactically very efficient.

20549. If the country is such that you can feed your small force in it?—Yes, every country will feed something.

20550. (*Sir Frederick Darley.*) Does it not come to this, that whatever your force is, it ought to be trained to the highest point of efficiency?—Yes.

20551. (*Sir George Taubman-Goldie.*) You would say brains before numbers?—Brains and physical and moral qualities too.

20552. Efficiency before numbers?—Yes.

20553. (*Viscount Esher.*) Take your own illustration, the case of the Shenandoah Valley; there your contention would be that the northern army might safely have been reduced in numbers if they had been more efficient?—If they had been much more efficient.

20554. That they were inefficiently led everyone admits, but has it ever been maintained that the men of which that army was composed differed materially from the men on the other side? We know that Jackson and Lee were very superior to the Generals against them?—I always thought that in the Southerners there was a larger element of men who were accustomed to out of door life, while the townsfolk predominated in the Northern armies. An efficient General is certainly a great acquisition, and in the instance we are discussing it was no doubt the element of difference in efficiency rather than the difference between the men that came into play.

20555. (*Chairman.*) And individual initiative and discipline you require also?—Although you want a great deal of individual initiative, because of the scattered fighting, and so on, yet discipline is quite as important, or more important than ever it was. You want discipline on a higher plane, as it were; you want a man who can intelligently take in exactly what you want him to do, and go on doing it all day, and two or

Mr. L. S. Amery. three days if necessary, without forgetting about it, and getting listless. The fault of our people was that when they came to a difficulty, and could not find their superior officer to refer to they stuck and became listless. You want somebody who when he is given a thing to do will just go on doing that. He may, perhaps, if necessary, slightly modify the exact wording of the order, but at any rate, he must be imbued with the conviction that he must try to carry out his superior's will against all obstacles.

20556. (*Sir George Taubman-Goldie.*) How do you propose to reach that end?—That is a matter for the Adjutant-General; higher training.

20557. We want all these qualities in our men, and we are anxious to find out how we are to get them?—I think more could be done; through barrack-square training we can make a man do what he is told the moment he is told it; for the higher discipline you must send a man to go a certain distance, and do certain things, and he must come back the next day, having done them, and he must get into serious trouble if he has not done

them. There are a variety of things you can do with that object.

20558. Why I ask a question of that sort is that there is no use saying to the Adjutant-General that every man must be an "Admirable Crichton"; somebody must show him how he is to be turned into an "Admirable Crichton"?—If you could be trekking about the country you could train them practically; if you sent a sergeant out with a certain number of men, and told him to take two or three days in going to York, and to bring so many horses back, and if he got into serious trouble if he did not do it well, that would be a very good method of training.

20559. (*Chairman.*) We have had a good deal of evidence that during the war the men improved very much, and the officers also, so that it is the opportunity they want?—Yes. One has to keep an eye on the training of the will, apart from the mere training of the ear.

20560. Is there anything else you would like to add?—I do not think so. I think I have covered most of the ground.

Sir ARTHUR CONAN DOYLE, called and examined.

Sir Arthur Conan Doyle. 20561. (*Chairman.*) When did you go out to South Africa?—I went out in February of 1900.

20562. What part of the war then did you see?—I came to Bloemfontein just at the time of its early occupation, within a fortnight of the entrance of the British troops, and I was there for about three and a-half months, during the enteric epidemic. I then went on to Pretoria; I went part of the way with Lord Roberts' army, and saw one or two operations, and I afterwards went back to Bloemfontein, and then went up to Pretoria, and was there a very short time. I came back to Bloemfontein in August, 1900.

20563. You have been good enough to give us a précis of the evidence you wish to give, and in the first place you wish to speak as to the medical side?—I think that is the only side perhaps that I am really qualified to speak on, because I was personally engaged in it.

20564. Of course, we had to take into account that there had been a Royal Commission inquiring into the special medical case on the spot, but we have had some medical evidence, and we shall be very glad to hear what you have to say. As you say, you were at Bloemfontein at the time of the epidemic?—Yes, right through from the very beginning of that epidemic.

20565. What would you like to say about that?—I thought that the medical service was somewhat unjustly blamed for not having everything ready for so abnormal a thing—a thing which has never occurred before, and probably will never occur again. I think it was impossible to keep any service always ready to cope with such an emergency as that; it would be a waste during all the time when the emergency did not come, and it might only occur once in a century. I thought no blame was due to anybody; everybody did their best to meet the very exceptional circumstances. I think the epidemic was due to the fact that the Boers had cut the water supply; when an attempt was made to drive the Boers away five weeks later they went without fighting at all, and it is a very great question whether they would not have gone at once, immediately, after Sanna's Post. Of course, it is a question on which a civilian hardly ventures to offer an opinion, but still, I think there are facts and grounds for thinking they would; and with 30,000 men in Bloemfontein, it was a very great misfortune that we did not recapture the water supply. We were thrown back on the old wells in the town, and there is no doubt that those 8,000 or 9,000 cases of enteric which occurred in Bloemfontein were entirely due to drinking the water of the old wells. If we had recaptured the waterworks there would not have been an enteric epidemic.

20566. Do you think the epidemic did not begin before that?—I do not think so; there was no evidence of it as far as I could see or hear.

20567. It was not due to the exhaustion in consequence of the march?—I do not think that exhaustion in itself would ever produce a specific disease like typhoid; I think that exhaustion, and then drinking bad water on the top of exhaustion, would be very likely to do so.

20568. It would cause it to be a very severe epidemic?—Yes. I question whether there would be an epidemic

from mere exhaustion. I was very much struck with the wonderfully good work that the private hospitals did, and how impossible it would have been to meet the situation without them.

20569. Was that with regard to the Bloemfontein epidemic or generally?—That is the only thing I am qualified to speak about really, because that was the only medical work I did during that three and a-half months in Bloemfontein.

20570. You were working yourself?—I was the head physician of the Langman Hospital, which was one of the private hospitals, and I was working myself.

20571. (*Sir Frederick Darley.*) Had you many men in your hospital?—We had about 150 cases all the time; we were only supposed to take 100. We had 100 beds, but the pressure was so extreme that we took 50 per cent. more than we were supposed to take.

20572. (*Chairman.*) Do you think that that service was not sufficiently acknowledged?—I think that the gentlemen who fitted out the hospitals have been ignored unduly. I think they did a great patriotic action; they spent a lot of money, they did the service really an incalculable good, and I think there would have been a terrible scandal and disaster if it had not been for the presence of those hospitals, and the gentleman who fitted out his particular hospital, Mr. Langman, has never had one word of official thanks of any kind whatever, except in the field, where the General on inspecting the hospital complimented him on its efficiency. I meant he had received no acknowledgment from the home authorities; he has not only had no reward, but no thanks of any sort.

20573. (*Lord Strathcona and Mount Royal.*) It has not been officially recognised?—Not in any way, and I think when we need men to do a patriotic action in the future it will take the keen edge off them a little that they have been ignored in the past.

20574. (*Sir Frederick Darley.*) Was Mr. Langman there?—He went out for a month at the end to see his hospital actually working, but his only son was in administrative charge of it. The only son, I may say, got some decoration given him, but that he deserved for his own efforts, quite apart from the fact that his father had fitted out the hospital. At the end of nine months the whole thing was given as a going concern to the Government without the Government being charged a penny. Mr. Langman kept it up for nine months, and at the end of that time he gave the tents and drugs and everything, so that some thanks were due to him.

20575. (*Chairman.*) It was taken over by the Government?—Yes, just the plant, not the personnel.

20576. (*Sir Frederick Darley.*) Was it a surgical hospital as well as a field hospital?—We supposed we would get more surgical than medical cases, but when we came to Bloemfontein we found there were nothing but medical cases. Later, I believe they got a large number of surgical cases when they went to Pretoria.

20577. (*Chairman.*) The medical service itself was short-handed?—It was very short-handed, and I think that could hardly be helped with such a demand as there was.

20578. (*Lord Stratheona and Mount Royal.*) Do you consider that the arrangements and methods of the Medical Board were quite up to the requirements of the moment?—I do not think they always were so. I think that the different hospitals varied very much according to the administrative capacity of the man who was in charge, and I think some were exceedingly efficient and I think some were not.

20579. With regard to the supplies sent out and the medicines, were they not very much antiquated and obsolete in many cases?—I think after the first pressure it was all right—all the drugs and everything needed were there; but during the first two months there was such a great pressure on the railway that I think many things were wanting which should have been there. Everything was wanting, in fact; all the conveniences, such as bedpans and things you really could not do without, you had to vump up.

20580. They had not given sufficient regard to the concentration of medicines; that is, to medicines in the concentrated form of capsules, and so on?—I never heard of their running short of actual drugs; I heard of them running short of all sorts of accessories, such as bedpans and so on, but I never heard of drugs being actually short.

20581. (*Chairman.*) That was only for the time when the railway was being opened up?—Exactly; the railway was running at the time, and had been for two or three weeks, and the pressure upon it was extreme.

20582. The single line had to bring up all the supplies also?—Exactly.

20583. You do not attribute any blame on that account?—No, I think not; I think they did very well.

20584. There were civil surgeons sent out by the Government. Were you satisfied with those you saw?—No, I thought they were a very mixed lot indeed; they were sent out singly, and not as a hospital. The men in the hospitals were excellent, but as to the single surgeons who were sent out, each just to do any duty allotted to him with the troops, I believe many of them were men of drunken habits, and not of good character, and, on the other hand, some of them were splendid. I think the Government should have taken more pains to test their men.

20585. (*Sir George Taubman-Goldie.*) I suppose it is rather difficult to take out a number of competent surgeons all having their own civil employment to give them a living?—Yes, but I should imagine that if the thing was organised in time of peace it would not be difficult, if a roll was kept with a number of names upon it.

20586. I know from experience the difficulty of getting even three or four really good men at a time?—I am sure it would be difficult if no preparation beforehand was made.

20587. (*Sir John Jackson.*) It is the case that in the medical profession in the lower grades you find an unusually large proportion of unsatisfactory men?—That is what I mean.

20588. (*Chairman.*) Do you think there might be a register?—Yes, and some inquiry into a man's character before his name was put on the register.

20589. Do you think men would register themselves?—I think that if they understood that in time of war those men would get the preference, and that the pay would be good they would.

20590. (*Sir Frederick Darley.*) I suppose you are aware that there is now an Advisory Board composed of some of the first men in the profession?—Quite so; I should think that would quite meet the case.

20591. (*Lord Stratheona and Mount Royal.*) As many able surgeons and doctors could have been procured from the colonies, say Canada, do you not think that under the particular circumstances of the moment it might have been well to have disregarded the rule that none were to be received into the Army except those who had actually passed examinations in the United Kingdom?—Yes, it never struck me, but certainly it would have been very wise to have done so. I did not know they made that rule.

20592. There was a hard and fast rule that they must have passed examinations in the United Kingdom, and those, at any rate, from Canada must do so before they could be admitted into the regular Army?—Well, it is very extraordinary. I never knew that before.

20593. They are endeavouring to alter that now, but

such was the case, although many would have been glad to have taken employment.

20594. (*Chairman.*) On the military side you wish to speak to the spirit of the troops you saw in the hospital?—Yes, their bearing was splendid. I never saw a case of malingering or anything of the kind during the whole time I was there, and I was particularly struck by the spirit of the Volunteers, which I thought was higher even than that of the Regulars. They seemed really keen to get back to their work, to get fit, and get back to the front.

20595. Do you mean the Yeomanry?—The Yeomanry and the Colonial troops, the Canadians and Australians, were all equally good, and I think all South African Irregulars, too.

20596. (*Sir George Taubman-Goldie.*) Even taking the Regulars, you would not say, considering that one always hears they are drawn from a lower class of the population, there was any bad spirit among them?—No bad spirit, but I thought the others were more educated men, and knew more what the fight was about.

20597. They had more intelligence?—Yes, quite so.

20598. (*Chairman.*) And the conclusion you came to was, that being able to get up good Volunteer troops a large standing army was not necessary?—I thought there was a strong argument for that from the excellent stamp of men we were able to produce so rapidly.

20599. (*Sir George Taubman-Goldie.*) Were these trained men?—The Yeomen seemed to pick it up. It was soon very difficult to tell which was the Regular and which was not. They all looked very fine soldierly fellows, and very keen at their job.

20600. (*Sir John Jackson.*) Did you find the men of the Regulars of as good physique as the Volunteers?—The physique of the Regulars was pretty good, because they had been well weeded out before that; the regiments were full of Reserve men, and I was much struck with their physique, they were splendid fellows.

20601. Speaking generally, a large number of the Regulars would be recruited from a class which perhaps does not always feed very well?—That is so, but on the other hand they had left all the weaklings behind, and they had called in their Reserves, so that the regiments were very fine regiments.

20602. (*Chairman.*) But in this you are speaking more of the spirit of the man than of his performance in the field?—Exactly.

20603. You did not see so much of his performance in the field?—No; I saw two or three actions, but none of them were of great importance.

20604. You would not be prepared to say that the Volunteer troops, good as they may have been in spirit, could do the work that the Regular trained Army could do?—No, I think as a civilian, I could not commit myself to that statement; but my general impression was that they did very well.

20605. And, on the other hand, you want to have the best possible men in the standing Army?—Exactly; it seems to me that if a man has got to be conveyed so far it is very bad economy to convey anything but a first-class man.

20606. You would rather have half the numbers?—Half the numbers, and double as good, certainly. The good men and the bad men each consume the same amount of food, and cost the same for arming and clothing, and it is very false economy to take anything but a good one.

20607. Even if he went at twice the pay?—That is so.

20608. And you would insist on good shooting?—I think that a man should be turned out of the Army if he is not a first-class shot; I think that should be absolutely requisite, and everything else is subordinate to that. That is the conclusion I formed not from what I saw exactly, but I wrote a little account of the war, and I examined into a very large number of documents concerning it, and that was the conclusion I came to.

20609. Have you come to the conclusion that the shooting was distinctly inferior to the Boer shooting?—Not on all occasions; I think there was some evidence that there were occasions when it was better, but I should think that taking the average rate through the war it must have been inferior.

20610. If you reduced the numbers of the standing Army in that way, you would have to have an extension of the Auxiliary Forces?—Yes, a large extension.

Sir Arthur Conan Doyle.

24 Mar. 1903.

Sir Arthur
Conan Doyle.
24 Mar. 1903.

20611. (*Sir George Taubman-Goldie.*) Or you might have universal training when they were young?—If you could possibly get it, but I do not see any Government going to the country with that cry.

20612. Did they not say the same about the Education Bill of 30 years ago?—Quite so.

20613. (*Sir Frederick Darley.*) After all, our rank and file did good work?—Most excellent work.

20614. Even at their present rate of pay, and with their present field of recruiting?—Yes, but I should think their shooting was very mixed; they had a certain number of good marksmen amongst them, but a large number of men were practically useless as shots.

20615. That is a question of training?—?

20616. (*Chairman.*) Is there any other point you would like to speak to?—I do not think there is anything that occurs to me.

20617. (*Lord Stratheona and Mount Royal.*) We have had it in evidence that the instruments used by the Army Medical Officers were very far inferior to those of the civil surgeons out there; that they were antiquated, and not such as were recognised as proper at the present day for surgical operations?—I could not speak on the point; our own were the very best procurable, but what the others had I do not know.

20618. We have it in evidence, also, that the sanitary arrangements of some of the hospitals were very bad?—There, again, that would be talking about other hospitals, and I do not know. We were so hard worked in our own hospital that if we did get out for an hour the last thing we thought of was to go and look at any other hospital, and all we wanted was to get a little fresh air. I was confined very closely to my own hospital for those three months.

20619. Had you an opportunity of forming an opinion of the services of the female nurses?—I think those nurses who got up to the front (I know nothing about those at Cape Town) were simply admirable, and I do not know what we should have done without them.

20620. They did excellent service?—Admirable; and we had such confidence in them that when we had a really serious case, and the drugs had to be given at a certain hour of the night, we did not ask the orderlies, although they were good men; we knew the nurses were infallible, that they would never sleep, and were bound to do their duty. The orderlies sometimes made a mistake, but the nurses never, and we had the utmost confidence in them. They were splendid, self-sacrificing women. Only three of them were in our hospital, and I believe two of them are dead. There is one other small point I should like to mention, and that is that it was very strongly borne in upon me over that epidemic that any breach of sanitary law ought to be made a military offence; the soldier never recognises anything except a military offence. You may argue with him, and give him advice, and he will not do it; but if they had made the drinking of foul

water (and I have seen the soldiers drink from the puddles by the wayside) a military offence, they would not have done it. No efforts were made to cut the thing off at the fountain-head, so as to prevent the men getting enteric; when they did get it, every effort was made to cure them, but no effort was made to stop them getting it, and as far as I know, right through the war there was no military order against drinking foul water, and no precautions of that sort were taken. We wanted preventive medicine very badly, I think, all through the campaign.

20621. (*Chairman.*) Precautions were taken in certain cases; we had at least one witness who told us that precautions were taken in his regiment?—I think it depended very much on the Colonel; I think if he liked it was done, but there was no general order, I am convinced, as to boiling water.

20622. (*Sir George Taubman-Goldie.*) Do you not think it would be a simple thing to have interesting lectures given at the different recreation rooms at barracks, showing the microbes and impurities in water?—I do not know that familiarity might not breed contempt.

20623. In addition to the men, some of the younger officers know nothing about the danger of microbes?—No; but I am quite sure that if the soldier was told he would be punished if he drank that water, he would take a direct interest in microbes then.

20624. We have had it on the highest authority that it was impossible to keep him from drinking it?—I think a military offence he will never commit.

20625. (*Sir John Jackson.*) Do you think it would be an advantage if in time of peace you had something in the shape of a retaining fee for medical men in consideration of which in time of war you should have a call on their services?—I think a mere registry, with promise of employment under a high scale of wage, would do it without the retaining fee, and I think that money might be saved.

20626. But a man gets on in his profession, and while he may be quite eager to go to war this year, five years hence he is in a good practice, and he does not feel inclined to go?—He need not bind himself to go, but he would put his name down, and he would have the refusal, and I think so many men would do that that you would find you would have enough for your purpose.

20627. Competent men?—You would have an opportunity of examining into their antecedents and character a little if they put their names down on a registry.

20628. But do you not think you would stand a chance of getting better men if under such an arrangement as I have suggested the Government could call upon men who in many cases would have had experience and had got on in their profession?—I think that would be the ideal way, but the country seems to be put to great expense over many things, and it is a question if it could be afforded.

20629. (*Chairman.*) Is there anything more you would like to add?—I do not think so.

(After a short adjournment.)

Major The Lord LOVAT, C.B., D.S.O., called and examined.

Major
The Lord
Lovat, C.B.,
D.S.O.

20630. (*Chairman.*) We are aware that you raised a corps for service in South Africa, and we are anxious to have a few particulars with regard to that corps if you have no objection?—Should I give the facts with regard to raising it first of all?

20631. If you please?—Immediately after Magersfontein I went to the War Office and asked permission to take out 10 or 12 gentlemen and 50 or 60 Highland stalkers for the purpose, being attached to the different brigades and divisions of the army in South Africa with a view to utilising their developed talent of using the spy-glass. The War Office declined my offer, and said I must produce a unit of 100 men or more units of 100 men each, and that they did not want any specialists to be used in that particular fashion. I accordingly raised two units of 126 men each, and as a matter of fact we went out 269 strong. We went out to South Africa and remained out there for 18 months. The first contingent took part in the advance from Bloemfontein to Pretoria and to Diamond Hill, then in the Wittebergen fighting and all through the earlier chases of De Wet in the Orange River Colony. In June Lord Kitchener sent

me home to raise another lot of men, and I took out a second lot of just under 300.

20632. In June of which year?—June, 1901. They landed early in July, 1901. The first contingent then returned home. On the 20th September of the same year Colonel Murray, who was the Commanding Officer, was killed, and there were heavy casualties, and a further draft of 130 men were sent out in November, 1901, making the strength up to 360 men or thereabouts. The second and third contingents remained out till the end of the war, landing in this country in August, 1902.

20633. What were the class of men you got?—The class of men were ghillies as a whole. We aimed at about 30 per cent. of stalkers, and I suppose we had between 20 and 30 per cent. of either *bonâ fide* stalkers or their sons, and I should say something like 35 per cent. of men thoroughly trained in the use of the telescope, and with several years experience of it.

20634. That was your specific object in view?—Yes.

20635. When the War Office told you that you must

Major
The Lord
Lorist, C.B.,
D.S.O.
24 Mar. 1903.

form units, did that mean that instead of being scouts they were to be used as ordinary Yeomanry?—Yes, I took that to be what they meant. We asked leave to be attached to the Highland Brigade for scouting purposes, and we were permitted to be attached to the Highland Brigade for scouting purposes, but the general idea as to using these men, and the way I considered they ought to have been employed was by being attached to general staffs, to the artillery, and the advanced guards, where they would have opportunities for using their telescopes. Instead of that they were confined just to the one brigade.

20636. And were used as ordinary soldiers?—Yes, but they were used in the main for advanced guard and scouting work.

20637. That was done, I suppose, by the authorities in South Africa?—Yes.

20638. But as far as the organisation in this country was concerned, it was a unit?—It was a unit similar to any other unit. We got no extra grant for telescopes, although I tried for it. The second time I went out I was given a grant of telescopes.

20639. How were you equipped?—In the same way as ordinary yeomen; we had very nearly the same grant as the Yeomen, although it was not quite so high.

20640. And were armed with the rifle?—The rifle and bayonet.

20641. You had no difficulty in getting the number of men you required?—No, we had about 1,200 applications the first time, about 900 the second, and 300 or 400 the third—about three or four times as many as we wanted each time.

20642. So that you could make a selection?—Yes, we were able to make a selection.

20643. And they were practically picked men?—Yes.

20644. And as a matter of fact they were used for scouting purposes?—Yes.

20645. Do you still attach great importance to the use of the telescope?—Yes, I do very strongly, but I think that to develop it to its furthest point would be on the three lines I indicate. (1) Attached to staff; (2) attached to artillery; (3) attached for scouting and outposts. The manœuvres are now in such extended order that it is impossible to see with the ordinary Zeiss glass, unless you are an expert with the telescope; to the full extent when the fighting is on anything like open ground—to see the extent and movements of your own forces and the enemy. Fighting is often carried on over 12 miles front. With the telescope in South Africa we have often distinguished single horsemen up to a distance of 14 miles on account of the clearness of the air, and moving bodies of men up to 20 miles.

20646. You would not be able to do that in this country?—No, but you would be able to tell moving bodies of men from the top of a hill with no mirage and with the light of the sun behind you, up to great distances. You would not do it in England, but you might do it miles off in Scotland, where the air is clearer. I do not know about that in this country, but in South Africa I am certain of those two distances stated. With regard to the artillery, I think it would be a very strong point for two special reasons, and the first is on account of this, that undoubtedly on a great many occasions the telescope was able to point out what the gunners, with Zeiss's, did not see themselves, and as proof of that on all occasions when we acted with gunners, if we went into action with the same artillerymen, they asked for some of our spiers to be attached; they always reported that the spiers did good work. As well as for finding the adversaries it was very useful in seeing that the advancing infantry on our own side was not shot into, as occurred on very many occasions in South Africa; I should think that almost every man would say that in every fourth or fifth fight they had seen shells being fired into the advanced columns of our own infantry. That arises from the range of the guns being so large, and from the fact that the artilleryman is busy firing his guns, and he fires at what he sees. Our men were no doubt able to get a more extended view, and having nothing to do with the working of the guns, they were able to watch the movements of other troops and prevent the infantry or cavalry on a flank movement being fired into. I may mention as an example that on one particular day, at a small fight at Wit Kop, Heilbron, a hill taken three times, each time our men were driven off by our own fire by separate guns, by the 5 inch first of all, then by the horse artil-

lery, and finally by the field artillery acting in different parts of the field. The hill was taken by the Scottish Yeomanry at one time; then the Bushmen were driven back, and it was taken again by the Scottish Yeomanry. I put that as an example to show you how often errors were made in shelling our own troops, which I think would be avoided by the use of the telescope. Finally, for the further use of the telescope it was useful for scouting and advanced guard work, and also for outposts. With the great range of the telescope you are able to see movements before they are absolutely developed, and in South Africa it was specially useful in connection with the habit of the Boers in laying traps for the advanced guard; as a rule, Boers were much more readily caught at six to seven miles off than when we were at about 3,000 to 4,000 yards, because by that time if they were going to lay a trap they were in their places. By detecting them at seven miles off you had seen them before they imagined that they could be seen, and the trap was seen in the process of formation.

20647. That a man with a telescope could do?—Yes, and the men with the Zeiss (the Boers being armed with Zeisses themselves) only got out of sight when they were able to see men coming, but the man with a telescope, being able to see further than that, therefore could detect them. In the same way we have often seen Boers with Zeisses riding from a distance, get on the top of a hill, and creep over the top and spy with their Zeisses into camp at four or five miles off, thinking they could not be seen, which was a definite proof that the telescope could more readily pick them up. I should like further to add in that particular line that I am absolutely certain of one thing, and that is that it is no good giving telescopes to untrained men. Outside the 35 per cent. I told you of we had a certain number of those Zeisses and opera glasses, and we invariably served these out with very much better effect to the men who had not had previous training. A man cannot learn in the course of a month or two accurate spying with the telescope.

20648. How long do you think it takes to train a man with the telescope?—I should say it would mean several months to make him better than a man with a Zeiss—six or seven months, but I think men improve up to 10 or 12 years' work. I have never met an amateur whom I should consider equal to a first-class stalker.

20649. How would you propose to get a sufficient amount of training, except from the men who actually take it up as their work?—I think there is only one way, and that would be by retaining fees.

20650. A retaining fee to stalkers?—A retaining fee to a certain number of men who had done well in the past, or a retaining fee to stalkers or ghillies if they joined any corps on the principle of the reservists.

20651. Supposing you went outside of the stalker or ghillie, so much training would be required, that you could scarcely devise a system?—I do not think so, for the telescope to be valuable. With Zeiss glasses men could undoubtedly improve themselves rapidly by practice, but with the telescope my opinion is—and I know a great many men who have been out there always held the same views, and all my squadron leaders, I know, held the same views—that it is not worth while giving a man a glass in the hope that he would train himself in a few months, but that it was better to give him a Zeiss, which he can quickly learn, and let him work on with that.

20652. I was thinking more of the future; you intend to have a corps raised?—Yes.

20653. You have got authority to raise one?—I have got them raised now; I have got a thousand men.

20654. Are they in the same proportion as to the men who can use the telescope?—Not in the same proportion, but I have got, I should think, at least 15 per cent. of first-rate men with the telescope. I may have others I do not know about that I have recruited, but in all cases where I got the chance of having a man with the telescope I took him at once.

20655. With the majority of the regiment do you propose to try to train them for the telescope?—No, I do not think you could train them for the telescope to be proficient. The essential things you have to teach your spiers to be experts in are to be able to catch up large masses of men at great distances, which one cannot do if you are only training them in Scotland with small bodies of men. The next point is, of course, to get them into the habit of making accurate reports and know-

Major

D.S.O.
24 Mar. 1903.

ing sufficient about military work to be able to follow the ordinary rules as to the number of men passing a given object in a certain time, and that sort of thing, which, of course, I could train them in, and I intend to do. And, thirdly, one of the most important points is to train them with guns, in order to be able to tell by very accurate spying where shells are bursting, which you cannot do unless you have opportunity of training with artillery.

20656. And the men who would do that work would be your 15 per cent.?—Yes.

20657. I was referring to the rest of the regiment. Would you endeavour to instruct them in the use of the telescope at all?—No, because I should have enough for my own use in the 15 per cent., and, of course, if I was given any grant of telescopes, or anything like that, I certainly would do so, but I would not be able to do it at the present moment.

20658. Would there not be the difficulty, even if you had a grant of the instruments, in finding time to educate the men?—Certainly, but I should like to let them have the telescope to use in their own time.

20659. You think they could teach themselves in that way?—I do not think it would be a very popular move in the Highlands with regard to the deer of the neighbouring proprietors, but it could be done in that way.

20660. As a matter of education you think it could be done?—I think, certainly.

20661. Because a man could teach himself?—Yes, they have all got the idea of it in the Highlands, because they are talking with stalkers and ghillies, and those people who go to the hill, and even if we took every ghillie that went out in employment, and gave him a glass, he would, instead of leading a pony, and not having a glass, use the glass and spy most of the time. If a ghillie gets a glass he will always spy most of the time, as it is an interesting pursuit.

20662. Your corps as it is now organised is to act as a unit in the same way as you did in South Africa?—Yes, two regiments of Yeomanry.

20663. And not, as you originally intended, as scouts pure and simple?—No. I did not bring up that idea before the War Office in my return. I simply asked for permission to raise two Yeomanry regiments because I did not think that they cared for anything except units.

20664. Do you think, from your experience in the war, that two regiments of the size of your present corps could be usefully employed in connection with the Army as scouts?—Well, you see you always get over this difficulty of using special scouts in this way, that it is so manifestly hard on horses; the advanced guard takes about one-third to a half more out of horses than any other work, and therefore in the ordinary practical work of a campaign you have got to have a certain roster on which men do their turn of advanced guard and of scouting work. You have perhaps your cavalry screen, which everyone takes their turn in, and you have your advanced scouts in front of your cavalry screen. Those advanced guards employ a great number of men, and the men having to go enormous distances to the flanks, they go very much further than the others, and they take tremendous exertion out of their horses, and therefore would not be able to come up to time unless special arrangements were made. As a rule, although they may give certain regiments preference for advanced guard, they have got to put in other regiments when the original regiments' horses are done.

20665. You think what is required is a body of scouts belonging to each regiment?—I think you ought to have trained scouts, certainly; there ought to be men specially trained in connection with each regiment. I think there ought to be a body of scouts. I do not know if you are arguing now on our existing methods, or on what our methods should be.

20666. I was thinking more of what they should be?—I am personally of opinion that if you had a properly organised body of scouts you ought to have them quite separate from the regiments, and get the advantage of the talent which we have in the Highlands, in Australia for trackers, which is most important, and fine riders like the South African men. I would have a special recognised scouting corps composed of men who are accustomed to such work, and who show natural adaptability to that particular line, but you would have to equip them differently, and you would have to give them two horses apiece, probably, and everything else in keeping with that, officers included.

20667. And attach bodies of them to every force as it was required?—Yes.

20668. (Lord Strathcona and Mount Royal.) What was the class of horses you had for your scouts?—We just got them from the remount dépôt as we could draw them.

20669. What size of horses?—They really ran to every size. There was absolutely no system about the issue of remounts. We were supposed to get what they called at one time Yeomanry cobs, and the cavalry were supposed to have rather larger horses than the Yeomanry, but as a matter of fact it really meant the class of horse they had got on hand in the dépôts.

20670. What would be the usual weight of your men?—I could not give you a certain answer as to that, but they are heavy men; the chest measurements are very high.

20671. So that they really ought to have a strong, wiry horse for the work?—Yes, they are distinctly bigger men than the ordinary cavalry regiment.

20672. (Chairman.) But the corps you are raising now is not intended to take the place you have been describing in the Army system?—No, I have not been asked to do that; of course, I shall personally develop the scouting side, because I think that is what my men are adapted to. I shall develop that more than any other line, and I have informed some officers at the War Office of my intention of doing that, and I think they believe that sound. I shall work on those particular lines specially, rather than trying to make them a smart parade regiment, which they would never be.

20673. Do you think the Yeomanry force is the best for the particular purpose of scouting, rather than the regular forces—part of the Army?—No, I think Regulars would be much better; I think there is nothing requires higher training and more strict discipline than scouting work, and I do not see how you can get that in perfection outside the Regular Army. You may have individually excellent men, but I think you would be very liable always to break down, both through lack of military knowledge and through not strict enough discipline.

20674. You think that the work of your corps in South Africa has proved the advantage of the system, and that the system ought to be adopted in the Regular Army; the system of training scouts?—Yes.

20675. But nothing of that kind has been done hitherto?—No. I think it would be an excellent thing if they gave bounties, or by some method tried to attract the men into the Army who would make the finest scouts. I am certain if they could get that done it would improve the Army very largely, and if they had a first-rate scouting corps the different classes I consider the best would be our Highlanders, the New Zealanders, and Bushmen for tracking purposes, and perhaps your Western Canadians, who have magnificent sight and knowledge of horses.

20676. The only disadvantage I see is that you would take away all the stalkers from the deer forests?—Yes, you would, no doubt, but I am afraid you would not get them to go.

20677. (Sir John Jackson.) Are your men mostly raised in the same district?—All over the Highlands, the Northern Highlands chiefly.

20678. Any from the west?—Yes, I had a good many men from the west. Sir Arthur Ord, the owner of North Uist, brought 20 men with him who did very well. It is rather against one's general opinion of the West Coast, but I am quite prepared to say, as to the 50 men in all that I had from the West Coast, that they were as good as any men I had.

20679. The general impression is not so?—That is so.

20680. (Sir Frederick Darley.) Did you enlist any men in the colony?—None.

20681. All here?—All in the Highlands.

20682. (Chairman.) You have a heading here, in your précis, "Imperial Yeomanry, with special regard to officers and organisation of the force." What have you to say about that?—The first point I wished to mention was the question of Yeomanry officers, the difference of stamp. I do not know if you care for me to go into that—between the first and second classes of Yeomanry officers who went out.

20683. Do you mean the first and second contingents?—Yes.

20684. We have, of course, had a good deal of evi-

dence with regard to that question?—And the number of officers who were sent home as useless?

20685. Yes, we have had evidence as to that?—And the points with regard to how those officers were selected, or if there was any selection?

20686. Yes, we have heard a good deal about that?—And that the regiments out there had practically nothing to say to any men who applied being given an officer's berth; I mean that the officers who were actually serving in South Africa had nothing to say to a man who had gone home from their regiment to this country, and who then applied for an officer's position at the building here.

20687. Are you speaking of the men in the first contingent?—To take an example, I had a man who went home from me—a completely worthless fellow—

20688. (*Sir Geogre Taubman-Goldie.*) Do you speak of the private soldier?—Yes; and who applied for an officer's position in the second contingent of Imperial Yeomanry. As far as we could judge out there, practically any man who applied who had been in South Africa before was at once given a commission. I had a special arrangement with the War Office in writing that I should select my own officers, and that kept me perfectly safe, and I never got anyone except I wanted him. As I say, I knew a case of one of my own men, and I know a great many other cases that I heard of by word of mouth. This man who went home from me asked me to recommend him for an officer, and I said I could not, but he came out with another lot almost immediately as an officer.

20689. As an officer?—Yes.

20690. (*Chairman.*) We have had a good deal of evidence of that kind?—I need not go into that point further. Besides that 184 officers who were sent off up to June, 1902, as undesirables, each regiment practically had officers who were completely worthless, and could not be taken on trek; they used to be left in the different headquarters for superintending baggage and stores, and that sort of thing. The number really was very considerable of officers who were worthless, and that is the point I wish to bring out.

20691. That did not affect you?—No, because I made the stipulation before I went out the first time, in writing from the War Office, that no officer should be sent me unless I wanted him.

20692. You went home to get a second contingent?—Yes, but for the third contingent the officers were selected for me by men whom I appointed to select them for me.

20693. (*Sir Frederick Darley.*) Were your officers from the Regular forces?—I got as many as I could from the Regulars; I got two in each contingent from the Regulars.

20694. (*Lord Strathcona and Mount Royal.*) How many men had you in your first contingent?—269.

20695. And the largest number altogether you had?—I had never more than 360 in the field together. The other point I should like to bring out with regard to the organisation of the Yeomanry officer is the point of ordinary home service. I have just been raising a regiment, and from inquiry in other regiments it seems certain that you have to take two classes of officers. You have first of all got to take your officers from the men of influence in the country, and the men financially sufficient to be able to help your squadrons to go, and, secondly, you want to get the other officers who, if it comes to war, would be ready to help, and who would really do the work of the squadron, and who, as a rule, are not so rich. At the present moment by the regulations one is given the same number of officers practically as in a cavalry regiment, but I think it would be advisable if the numbers of officers in the Yeomanry were increased. In the first place a sufficiency of officers in the Irregular forces is more necessary than in the Regular forces, as the discipline is not so high, and non-commissioned officers less effective, and then in time of peace, if you are able to have rather more officers, it lessens the expenses in the regiments. At the present moment the system is gone on that no attention is paid to the fact that you have these two different classes of officers, and the result is that you can get your men of position easily enough, they can afford it, but with the equipment they have to provide themselves with and the cost of the annual training, and so on, the 16s. 8d. that the subalterns get does not cover it, and therefore you are not able to get the number of poorer officers whom it would be advantageous to get into the

Yeomanry. As well as that, you have hard and fast regulations now, that they have got to do a course at Aldershot and a course of a month with the Yeomanry or with a Regular unit in their first two years. This prevents your men of the second class—your poorer men you want to get in—coming, because they cannot get away very often for the time to do this. My opinion is that if you could pay them a little better for these classes and make it easier for them during the time of training, you would get not only your landed gentlemen in and the people you must enlist, people of influence, but you would also get the poorer class, the large farmer class or the gentleman farmer, or the barrister without much money—a man with brains, but without means—and by paying him a little higher for those different obligatory classes and courses you would make it worth his while to go to them, and therefore you would get him as an officer. There is no doubt about it that your landed proprietor and the person you put in for recruiting purposes of your regiment is not always much aid once you have your Yeomanry regiment going, and therefore you want as well younger men perhaps to carry on the business, and you can only get that if you are not tied up in any way, and if the point of finance is no bar. I am thoroughly in favour of courses, and I think the more courses the better, but you must make them easy for the poorer men who attend them.

20596. (*Chairman.*) All these officers are Volunteer officers, and not officers of the Regular Army?—Yes, these are all Yeomanry officers I am referring to now; I am just talking of the organisation of the Yeomanry.

20597. In peace time?—Yes.

20598. On service, I suppose, you would look forward to having Regular officers among them, too?—There is no doubt that the Yeomanry regiments do well with the Regular officers, because they have the training. I am absolutely convinced, because I have trained three separate lots, that you can train men as quick as you like in a very few months to be as good as you ever get them up to the stage which you cannot get beyond without strict discipline. You cannot train officers in two or three months, it takes many months before they really become so that you can trust them to do work.

20599. Would you not hope to get into the Yeomanry, even in peace time, officers who had served in the Regular Army?—I daresay there might be a certain number.

20700. But that would not be sufficient backbone?—I do not think so; if you could get them it might, but as you think you would get them in sufficient quantity?

20701. I was asking you?—I beg pardon. I do not think you would. I do not feel qualified to offer an opinion upon that, because I really only know northern Yeomanries, and just casually about Yeomanries from the south, and it has not been my experience yet from what I met in South Africa that there were a great number of Regulars. A few fashionable regiments undoubtedly had them, such as the Bucks Yeomanry.

20702. Of course, in the emergency in South Africa the Regular officers were not available probably?—No, and therefore they would not be in any future war.

20703. (*Lord Strathcona and Mount Royal.*) You speak of giving somewhat higher pay; what rate of pay would you consider sufficient to induce the class of men you mention to enter?—I think they must first of all get the whole of their equipment free.

20704. (*Sir George Taubman-Goldie.*) How much does that come to?—It depends chiefly on the clothing—£32 is the minimum, I think.

20705. To be renewed how often?—It very much depends on the smartness of the corps, and those things.

20706. On the average?—I have only started my regiment, and I do not know. I have never been in the Yeomanry before.

20707. Following up Lord Strathcona's question, you could not say what the annual cost of your proposal would be per regiment?—No, I have not calculated it out. I could answer your question, perhaps, in another way, namely, that as a rule, in regiments, I have heard that it costs a subaltern about £40 a year.

20708. (*Sir Frederick Darley.*) What are they paid?—Some get 6s. 8d. a day and 10s. grant.

20709. What would you make the pay?—I think I should raise it by another 10s. or so—give them £7 more, and they should get their equipment clear, and I should give a contingent grant to the commanding officers, so as to cover prizes, band, etc., which at the present moment come out of the officer's pocket.

Major

Majors
The Lord
Lovat, C.B.,
D.S.O.

24 Mar. 1903.

20710. And you think that by giving that additional pay you would attract the men?—Yes; so many of them have to get a man to take their place, and the whole of their pay which they draw at their course goes to this locum tenens. That is what so many officers complain.

20711. (Lord Strathcona and Mount Royal.) You spoke of the uniform. Did you find the clothing supplied of good quality?—Yes, first-rate.

20712. Were you satisfied with the boots?—Yes, first-rate. We supplied our men with boots in the first instance.

20713. We heard a great deal about the quality of the boots?—I could not say about boots, but the clothing I should say was good. I do not know about boots for this reason, that we supplied our own boots to the men when they first went out.

20714. Do you consider that two pairs of boots or shoes were sufficient for the year?—My acquaintance with facts of that sort is small on active service. We drew boots without any rule. If so many men wanted boots, they just got them; therefore, I am afraid I did not keep statistics. I could not give an opinion of any value, but the clothing, taken throughout, and the accoutrements were excellent.

20715. (Chairman.) Have you anything else to say about the organisation?—No.

20716. You also have a note here in your *précis*, "Some headings under which public moneys have been wasted in South Africa." What have you to say on that point?—I thought of mentioning one or two headings which specially came before me. The first one, which no doubt you have had particulars about, was the pay to the native leaders and drivers of oxen.

20717. I do not think we have had that before?—The natives at the beginning of the war were paid at the rate of £4 a month for a driver and the ordinary rate of pay in the colony for this class of native before the war was something like £3 to £4 a year, with perhaps a couple of sheep and a small amount of mealies. This pay of £4 for the drivers went on till February, 1901, and then by order the rate of pay was lowered. I may say that from personal observation the natives have not the least idea of the value of money. Every South African I ever spoke to on the subject, and I spoke to a very great number of large employers, including men in Kimberley, and farmers, were flabbergasted at the rate of wages paid. The number of drivers of those ox wagons was very considerable, and the sum wasted was therefore a large one. My opinion is, and it was the opinion of many of the people out there, that if you had paid drivers a half, or even a third, of the amount, you would have got equally good men. A large number who were supposed to be good drivers were totally unskilled.

20718. (Sir George Taubman-Goldie.) Can you remember when that pay of £4 a month started?—No, but it was there when I arrived in March, 1900, and it went on to February, 1901. I understood it started from the beginning of the war.

20719. That is your impression?—Yes.

20720. (Sir Frederick Darley.) The transport officers were responsible for that, were they?—No, it was the people who made the contracts at the beginning, I presume.

20721. Who were they?—I do not know; we only took the orders given us to pay the £4, and we paid it. I presume it was the advisers as to the contracts at the beginning of the war.

20722. (Chairman.) Where did you get the natives from?—I do not know in the early stages where the natives were got from, but in the later stages, when we had to get natives ourselves, when everyone had to impress them more or less, we used to go to certain spots where there were native agencies, and the way they did at Dordrecht, for instance, was that they paid so much to the head chief, and he provided so many natives; I think the rate was 10s. a man produced, and they came down and practically served in forced labour until the thing was finished.

20723. Were those men paid £4 a month?—No, that was in the latter stages. I take it the men all through were paid on the same principle. We used to be sent out with raw drivers. We used to go to the transport and requisition for so many drivers.

20724. You got them from the transport?—Yes, unless you could pick a man up on the road; you saw a big native on the road, and asked him to come and drive for you.

20725. The men you paid £4 to you got from the transport, and they got them from the contractors?—Not all from the transport; we very often picked them up; you would go to the transport if you did not know where to get natives.

20726. Did you pay £4 to the men you picked up on the road?—Yes, for drivers that was the standing wage.

20727. (Sir George Taubman-Goldie.) When you say you picked them up what do you mean?—You might see a man at a native kraal, and you would give him a pot of jam, and ask him to come, and he would very likely take it on at once. To show how little they knew about money, they used to pay up to 30s., or £2 for a single spur, which is always a native's delight to have on his feet.

20728. (Chairman.) The reason I asked the question was that those men you did get from the transport were contractors' men—the men the transport got under some contract?—I could not tell you, but I should not think so, because they were always looking about for men, and I think they just picked them up as we did.

20729. Were not the oxen contracted for?—That is different; I do not talk about Julius Weil's contract, and that I know nothing about. I talk about the regimental transport, our mule wagons, and so on.

20730. How were the mules provided? Were they not by contract, too?—No. The mules and mule wagons belonged to the Government. The ox transport which was arranged for by Julius Weil was, believe, at first paid for at the rate of so much a day and so much a span, and there were certain iniquitous rules to the public cost about that; if they were over driven they used to be filled up by looted oxen. The mules were regimental transport, and the regiment had to get drivers somewhere, either from the transport or by picking them up from the road.

20731. And it was those you had to pay £4 to?—Yes.

20732. (Sir Frederick Darley.) Do you know what the contractors paid for the drivers of the oxen? Did they pay £4?—If it was Julius Weil, he certainly would not. The common rate of wages before the war I know, and during the war at different farms, was from £2, in some cases to £3 and £4 and £5 per year, with a sheep every now and then and mealies.

20733. (Sir John Jackson.) Do you think that in all cases the chiefs were paid?—I will not give that as an opinion.

20734. But in many cases?—I am sure that it is the only way to get natives.

20735. I know several cases where large numbers of men were got without a single sixpence being paid to the chief, not for fighting purposes?—I only just speak of instances I know about. I do not offer the information in a general way, but it is the common plan to get natives in that way.

20736. (Chairman.) Have you any other instance?—I thought I would bring up the instance of the kit that was given to us—the unsuitableness of certain kit which was issued. To take one example of the wastage of money in that way: they issued a hay net for South Africa, and they continued to issue it to the end of the war or within a very few months of the end of the war; and also a shoe case. Now, no man ever carried a hay net in South Africa, because there was no hay. When I came home for my second contingent I said, "I do not want any hay nets," but they told me I should take them out, and I did. In the same way no man ever wore a shoe case after the first three days out from home, and everyone must have known that, and they knew it at the War Office. I sent back a report myself on the subject, which was acknowledged. There were several other useless articles, breast-plates, and so on, which were issued with a lot of horse trappings for each horse, and which were generally thrown away on arrival in South Africa. There was no good dragging them about in a wagon. That is just an instance of the way money is wasted, through lack of communication from here to the front, or from the front back, or not paying attention to communications.

20737. These unsuitable articles were simply thrown away?—Yes, or returned into store out there. If you were on the veld when you got a brand new lot of men sent you, you would throw the useless articles

Major
The Lord
Lova', C.B.
D.S.O.
24 Mar. 1903

away. With the second contingent Lovat's Scouts the useless rubbish was put into store, but as to the third contingent, we dropped a lot of kit; we were trekking hard, and we could not fill the wagons with rubbish. The third point I was going to bring up with regard to the wastage of public money, was the subject of Yeomanry pay. The Colonials had a paymaster attached to each corps, and the Yeomanry had not. It was by not having a regimental paymaster, I consider, that the Yeomanry pay-sheets got into a hopeless state of confusion.

20738. (*Lord Strathcona and Mount Royal.*) Do you mean the loyal Colonials or those from over-sea as well?—I think all the Colonials had a paymaster. I will not be absolutely certain that all of them had, but a great many Colonial corps had; in fact, all I met had one regimental or corps paymaster.

20739. (*Sir Frederick Darley.*) The Australians had?—Yes, and the South Africans, but I do not know about the Canadians.

(*Lord Strathcona and Mount Royal.*) They had a paymaster.

20740. (*Chairman.*) But you had none?—No, no Yeomanry regiment had a regimental paymaster.

20741. Had you the system of the Army—the company officer?—Yes, but in many cases he was a Yeoman raised by promotion, and he had not the slightest idea how to keep a pay list. It might easily happen that the sergeant went sick, and you would have no man competent in the squadron to keep a pay list at all. There were some gross cases that I knew of which occurred, and the method was very slack. The management at Cape Town in the late 1901 and early 1902 seems to have been very moderate. It was very hard to extract answers to letters, and there is an example in October of a gentleman in Mafeking by the name of Robinson, who raised about £1,400 on one of my company accounts, and the company was charged with this amount right on to June, so that presumably the man had seven or eight months to get away or spend the money if he wished.

20742. I do not quite understand how it was done?—The system was so lax. He cashed a cheque on a company of Lovat's Scouts, and signed it as being the officer commanding the company; the cheque was cashed as part of the Yeomanry account and charged to me; we could not get at it to explain that we had not had the money, and there was no system. If we had had a paymaster we could have detected errors instantly, and it could have been brought back and checked, and this man Robinson, presumably an officer, could have been got at immediately. As it was, we could only report to Pretoria and Cape Town, and then go out on trek for a month and come back to find that nothing was done. There is another example of how money apparently was lost or wasted; two captains I know returned to their company and found their pay-sheets were for some reason or other balanced out £1,000 in their favour; they had paid all the men that there were, and they might have taken a cheque and walked away with the money. You cannot blame the Yeomanry officers, because many of them had never kept accounts.

20743. (*Sir George Taubman-Goldie.*) There has been a Committee sitting in London upon that?—Is it on this point?

20744. Yes, Lord Scarborough's Committee?—He is only auditing the accounts.

20745. Yes, trying to put them in order?—Yes, but it is not a committee taking evidence and reporting, to correct mistakes in the future, and that is why I mentioned it here.

20745. (*Sir John Jackson.*) Was this case of £1,000 just an even £1,000?—When I say £1,000, I mean just about that.

20747. Is it not a question of a clerical error?—No.

20748. (*Sir Frederick Darley.*) A combatant officer is not supposed to be an accountant?—No.

20749. (*Chairman.*) Did the men have difficulty in getting their pay under those circumstances?—Yes; certainly Lord Scarborough is doing extremely good work, and any case you bring to his notice is dealt with at once. I do not think anyone can complain now. I can only speak from knowledge of my own men; I made complaints about some of my own men, and the complaints were at once listened to. To return to South Africa, and how impossible it was for officers on

trek to keep accounts or returns, when a column went away on trek for six weeks and came back, there was a whole file of documents waiting; we had as many as 164 documents when we came in for a day to attend to. In 24 hours you had to get the whole of your provisions, refit, etc., so that you dealt out a few to some of the officers, who did not look at them, and out you went again for four more weeks. These blue papers were to the effect that John So-and-So had got £5 from the officer at the base, and please put it to his account. There are still accounts coming in from the other side which we never got at all. With pack mule transport you could not carry letters about, and they were simply dumped into your box, and you might not return to the same place for three or four months again. In the latter year no column stayed on the line for more than 36 hours, and I do not think there can be any question that a regimental paymaster at a fixed base would have saved the country large sums.

20750. (*Lord Strathcona and Mount Royal.*) Did you make any suggestion to the War Office about having a regular paymaster?—No, because I saw in Lord Roberts' statement before Mr. Akers Douglas' Committee that they proposed having it for the Regulars.

20751. I do not mean now, but in the early part of the war?—No, I did not make any suggestion, and I have not since I came home, simply because I saw Lord Roberts had made some statement that he thought it would probably go back to the system of the regimental paymaster, and if there is a paymaster for the Regulars there will certainly be one for the Yeomanry. Another point on the subject of wastage of public money is not remounts, but it is a branch of the same thing; in some of those departments there seems to be no sort of interchange of orders or responsibility in carrying out work. For example, about 6,000 horses, mares, and foals were near a place called Burgersdorp, and there was no apparent reason that they should not all have been used for His Majesty's forces. They were good mares and young horses; there were few absolutely fit to ride at once without training, as the mares in South Africa, although broken to harness, were never broken to riding. These mares were all kept in this place, and apparently no one seemed particularly interested in the matter, and the remounts had them in charge; they were left to run over two or three small farms, and they gradually pined away and wasted from lack of food. No one was allowed to take what they wanted of those, and at the end of the war these 6,000 horses had diminished to about 700 or so. I only wished to quote that as an example of the way in which many things were not looked after, and through lack of officers to supervise and lack of system, thousands of pounds were thrown into the sea.

20752. (*Chairman.*) Were these captured horses?—They were cleared off farms; I have seen perhaps 1,500 or 1,200 sent to this farm in one drove.

20753. And they were chiefly mares which would not have been used for cavalry?—Yes, mares; but there was no reason why they should not be used; they only required to be broken and to get a little condition on, and they would have done as well as horses, but for some reason before the war the Boers did not ride mares, and it was supposed to be a sign that you were a poor man if you rode your own breeding stock. By the second year I know that every stallion in South Africa had been caught up; no mares were in foal, and therefore all were fit to ride when conditioned.

20754. (*Sir George Taubman-Goldie.*) During that time were you not in want of horses?—Yes, and I took them when I passed there, but I was not allowed to take them. I asked leave on one occasion, and I was refused.
